Hereford Cattle.

May 18, Birch & Thompson, Lake Geneva, Wis.

THE MARKETS.

Union Stockyards, Chicago, Ill., April 21st.—The somewhat liberal run of cattle around the market circuit again this week spells liquidation. For most of it the excessive cost of feed has been responsible, but feeders are still apprehensive of price fixing and believe it will be detrimental to their interests if resorted to. A Washington dispatch stated that the council of national defense had approved of Secretary Houston's plan, giving it authority to fix both maximum and minimum prices, and also to establish food distribution stations, but the secretary stated that such action was merely in the nature of precaution and would not be resorted to except an emergency arises. Certainly no emergency exists at present, nor is one likely. Of course, where cattle cannot be held advice to hold them back is superfluous, but unless such sacrifice is necessary it should be avoided. Thousands of little cattle have been dumped during the past two weeks, the owners of which will be nursing red-eyed regret before long.

Seasonable temperatures are stimulating the rise of grass, promising relief from feed scarcity. This ought to arrest current liquidation of light cattle which can be thrown out on pasture. The break of the past two weeks, which is equal to $1 per cwt. on many grades of light steers, has been due wholly to excessive marketing of immature stock. Had grass been available or corn more plentiful much of this liquidation would have been avoided. Hight retail prices have curtailed meat consumption and there has been a seasonable slump in trade, but in the case of beef cattle, excessive marketing is the chief depressing influence and until it is stopped the selling side will have trouble.

Cattle traders at this week-end are trying to get their bearings after a slump in values that, on most classes, has been continuous since early last week when prices hit the highest levels in market history. Yearlings have been hit the hardest, many little cattle weighing anywhere from 600 to 900 pounds and now selling at a range of from $9@10.50 showing declines of 75c@$1 from the recent high spot. Letting such cattle go at this juncture is a mistake and those making the sacrifice will realize it later. Feeders cannot take them to throw on grass, as they have had a little corn, consequently, they go to killers without competition. Yearlings coming now represent the June run and even then most of them are sacrificed short of condition.

Choice heavy cattle have suffered less than other classes of beef steers, but they have not escaped vicissitude. While a new high top of $13.50 was made Monday on prime weighty bullocks, the best heavy cattle seen here in weeks sold Wednesday at $13.35. This decline is not marked, but very few steers now coming can pass $12.50 and 25@50 cents declines from a week ago are shown on the bulk of the steers between that figure and $9, putting the bulk of the light and medium weight steer cattle 60c@$1 under the high spot early last week. Beef trade is in a rut. The kosher market for chucks at New York has had a sharp break and is weak at the decline. Prices reached a level where the consumer balked, which is merely a case of history repeating itself.

There have been two kinds of market this week in the she stock trade. Stress of demand has centered on canner and cutter cows which have not been plentiful and which have absorbed strength from the abnormal demand prevailing for such meat products as go into the manufacture of canned meats and sausages and from the activity and strength

Splendid Saxon Auto for You

4		7
	7	3
6	4	

You would like to have a Splendid Saxon Roadster now, wouldn't you? I have given away many of these fine cars and the people who received them were delighted. I want you to have a chance at this one, and I ask you to send me your name so I can tell you all about my great offer.

Soldier Boy Postcards Free

Just to get you interested (this has nothing to do with winning the auto) I offer you a set of six beautiful Soldier Boy Postcards if you can solve this missing number puzzle.

What numbers, placed in the vacant squares will make a total of fifteen when added either up and down or across?

Just fill in missing numbers and send 4 cents stamps to pay cost of mailing and I will send you this set of beautiful postcards showing our gallant Soldier Boys in action. In the same letter I will tell you about great Saxon Roadster offer.

of the hide market. They are commanding the highest prices on record and show 15@25c advances over a week ago. Medium and fat cows, on the other hand, show steady to lower levels than a week ago and are largely 35@50c below the high time early last week, while light heifer yearlings have been subjected to the same sharp, irregular declines as have marked the trade on steer yearlings. On the current basis of prices canner cows selling at and below $6.50 are shelly light dairies, not above suspicion as being tubercular, $6.75@7.15 buying fair to good canners and $7.25@7.75 taking plain to good cutter cows. A fair to medium class of butcher cows sells, however, at $8.15@8.65, a good, strong weight beef class at $9@9.50 and only choice heavy Kosher cows above $10, a strictly prime kind being quotable on up to $11@11.50, but rarely to be had. Heifers at $7@7.85 are common or stockery light stuff, but $8.50@9 is taking a fair to medium killing grade, a good, fat class going at $9.25@10 and only choice corn feds at $10.50 and above. Common light bulls are selling extremely well along with low-grade she stuff, light canner bulls making $6.75@7.50. A decent 1,100 to 1,200-pound bologna grade, however, sells at $8@8.25 and $8.50@8.65 is buying good to choice heavy bolognas. Butcher bulls now sell largely at $8.75@9.50, only an occasional prime beef bull up to $10. Veal calves are being freely marketed and are showing seasonal declines, a lot of 95 to 100-pound vealers selling at $11.25@11.50 and good to choice 100 to 130-pound veals selling from $11.75@12.50.

Stock and feeding cattle trade continues of comparatively narrow volume, advancing corn prices and government price-fixing agitation being the demand curtailment factor. With the grazing season near ,however, a fair call has been had this week for stock cattle to put on pasture and this demand is expected to expand with the rise of grass. Prices show some decline from last week's closing and are largely 25@40c below the high time at the start last week. A good business class of 700 to 850-pound steers is selling at $8.40@8.85, an order buyer taking out 100 head of decent qualitied thin stockers at $8.35. Few feeders sold above $9.25, with bulk of all grades at $8.40@9.50. Feeders paid on up to $10@10.45 for a few loads of meaty strong weight steers, but they were a kind worth $11@11.35 to killers early last week.

Packers have had 'their bear clothes on" in the hog market this week and with some increase in receipts around the market circle and a less avid shipping demand, reflecting decreased consumption of fresh pork due to its high price, the "economy campaign" and higher temperatures, declines from the lofty level of prices shown a week ago have been easily enforced. At the close yesterday the market stood lower than the corresponding day last week, with pigs and light-light stuff weighing under 150 pounds showing a dollar break in extremes. Quality has been the poorest of the season, the proportion of pigs and lights being materially increased and choice strong weight butcher hogs scarcer. The $16 hog was counted out on Thursday, the extreme top being $15.95 and the bulk $15.40@15.85, but the $16 top reappeared Friday on a 5c advance. A few 150 to 180-pound light mixed hogs are selling down to $15@15.35 some 138-pound "pig stuff" as low as $14.50 and good to choice 90 to 125-pound pigs at $12.25@13.50. The decline curtailed receipts the last two days, but packers are acting extremely bearish and unless the marketward movement is kept down next week further declines are not improbable, although the situation can turn bullish overnight and supply curtailment early next week might easily prompt a reaction to higher levels. Provision stocks are rapidly diminishing. On April 1st the combined stock of cut meats at all packing points was 310,110,000 pounds, a decrease of 21,552,000 pounds during March. On April 1, 1916, the stock was 285,253,000 pounds. The April 1st lard stock was 57,901,000 pounds a decrease of 7,542,000 pounds during March; last year it was 106,753,000 pounds. The stock of pork on April 1st was 66,578 barrels against 81,285 barrels last year, the March decrease being 7,000 barrels. The present stock of meats is 15,813,000 pounds less and of lard 11,953,000 pounds more than the April average of the past ten years. High prices have curtailed neither exports nor domestic consumption.

Packers have been fighting the lamb market all this week, but have succeeded in inflicting only the slightest damage to the price list and that promises to be speedily repaired, the market closing healthy and with short runs in prospect for the coming week and for several weeks to come. At the close yesterday $16 was taking the best handy wooled lambs, against a $16 top at last week's closing, while the quotable limit on shorn lambs is $12.85, against an extreme top of $13 at last week's closing. A lot of strong weight lambs in the fleece sold, however, at $15.50@15.75 that were practically as high as at any time and scarcity has made sheep and yearlings immune to decline, good shorn classes, in fact, looking a point higher than a week ago. It is largely a $12.35@12.65 market on fair to good shorn lambs of desirable weights, with prime 103-pound fed westerns selling at $12.30 and some plain heavy clippers down to $12 or below. Light shorn yearling wethers scored $11.75 and good to prime shorn wethers at $11.15@11.50, the best shorn ewes at $11. Wooled yearlings at $13.50 were a good, but strong weight kind, and a prime light class is nominally quoted to $14.50, or higher, while $12.75@13.25 is taking wooled wethers of good to prime class and $12.75 a good fat grade of wooled ewes.

No good reason could be assigned why the federal government should take over stocks of wool, and Washington acted that way. Trading has been resumed, 50@52½c per pound being paid for big clips at feeding stations near Chicago this week, with every indication that the market is on a legitimate basis. Nothing will be more calculated to stimulate sheep husbandry than a high wool market and the business needs support of that kind at this juncture. Government control would have exerted a discouraging influence.

HOLSTEIN BULL CALF FOR SALE

Korndyke Washington Ormsby

His sire is from a 23-lb. junior two-year-old daughter of Sir Pietertje Ormsby Mercedes and a 29.98-lb. dam. His dam is a 13.01-lb. junior two year old whose sire is from a sister to the sire of Ormsby Jane Segis Aaggie, 44.42-46.33 lb.

Look up his sire, Sir Korndyke Fytje Pietertje No. 132719.

I own his dam, Bonnie Ormsby Colantha No. 228930.

As I live in town and have no room for him, he will be sold worth the money.

BEN BACHHUBER
Elkhorn Wisconsin

DON'T WAIT

UNTIL you are ready to use a bull, but buy a calf and have one when you need him. You can raise him as cheap as we can and you will save on express charges. The one you want may be gone if you wait too long. Write now.

EDGEWOOD FARMS, INC.
Pewaukee Wisconsin

RIVERVALE FARM

OFFERS some fine Holstein bull calves, very light in color, from A. R. O. dams and grand dams and sired by Korndyke Pontiac Piebe Burke, a grandson of Piebe DeKol Burke, at very reasonable prices. Address
GEO. H. GIBSON NASHOTAH, WIS.

AT LA BELLE VIEW FARM

WE sell Ormsby bull calves by wire before breakfast. If you want one of these youngsters from an A. R. O. dam, sired by our richly-bred Ormsby sire, whose six nearest dams have a 4% test and better, and who is first cousin to Duchess Skylark Ormsby (dairy queen of the world) get busy. Our prices are very reasonable.
EARL E, ROSENKRANS Oconomowoc, Wis.

HOLSTEIN BULL FOR SALE

HOLSTEIN BULL, born Oct. 14, 1916. Good A. R. O. records on both sire's and dam's side. Nicely marked, about one-half white, straight, good size, ready for light service about May 15th. For pedigree and price apply to Mountain Ash Stock Farm, J. B. Cain, Prop., Glenbeulah, Wis.

HIGH grade Guernsey and Holstein calves, 2 to 3 weeks old, $20. Crated to ship anywhere. 31.32 pure. Chas. Blott, Mukwonago, Wis.

REGISTERED HOLSTEIN BULL CALVES

FROM A. R. O. dams. One born Jan. 16, 1916. Well grown and ready for light service. Priced to sell immediately. Write for pedigrees and prices.
NORTON FARMS R. R. 11 FRANKSVILLE, WIS.

26.64-lb. Holstein Bull

TEN months old, sired by Sir Parthenea Champion and from the 26.64-lb. 3-year-old heifer, Parthenea Jolie Clothilde De Kol. Four other young bulls from A. R. O. and untested cows, 7 to 10 months old. We also offer for sale our senior herd sire, 8 registered and yearling heifers and bull and heifer calves. We produced 16 A. R. O. cows last year, several from 20 to 28 pounds. Come and visit our herd and see the sire and dams of these animals.
ADAM LORENZ SHEBOYGAN FALLS, WISCONSIN

Guaranteed Holstein Bulls

FROM 1 to 11 months of age, out of large record A. R. O. cows. They are sired by the great bulls, King Artis Pontiac and King Korndyke Veeman, that have records in their pedigree from 30 to 41 lbs. butter in 7 days. They are priced to sell.
Wisconsin Star Stock Farms Ed M. Schultz, Hartford, Wis.

"WHERE PRICE AND QUALITY MEET"

HOLSTEIN BULL CALVES by 32-lb. sires from A. R. O. dams. Popular breeding, good individuals. $100 up. Write and mention Wisconsin Farmer.
TULLOCH & FRIES' HERD GENOA, WIS.

When writing to advertisers kindly mention The Wisconsin Farmer.

1 This special radiator—ten times more efficient than the radiator of the Ford—guarantees perfect cooling—without this installation no automobile motor can work satisfactorily as a tractor.

2 Front end of Smith Form-a-Tractor frame fastens to front axle of Ford—a feature of strength and convenience not duplicated in any other construction.

3 Smith Form-a-Tractor frame extends full length of Ford frame, reinforcing it and leaving no part of the tractor attached to the Ford when used as a pleasure car.

4 Three rows of conical lugs—twenty-seven to each wheel—give unusual efficiency in soft soil—distinctive Smith Form-a-Tractor construction.

Smith Form-a-Tractor

Guaranteed To Do the Work of Four Big Horses

COMBINES with any Ford touring car or roadster to make a fully guaranteed tractor, duplicating, in amount of work it will do, the highest priced, biggest tractors you can buy, and giving you the most efficient tractor construction that you can get.

Fifteen minutes will change your Ford to tractor, and it takes only fifteen minutes to make the change back again. The tractor construction is complete and leaves nothing attached to the Ford with the exception of the new special Smith Form-a-Tractor Radiator and the patented Force Feed Oiling System.

Back your Ford over the Smith Form-a-Tractor frame—jack up the rear axle—pull off the Ford rear wheels—replace them with the Smith Form-a-Tractor roller driving pinions—connect up the Smith Form-a-Tractor axle to the Ford axle with special clamps—clamp the front end of the Smith Form-a-Tractor frame to the front axle of the Ford frame, and the conversion is complete. All the work is done by the Smith Form-a-Tractor attachment. The tractor wheels push the Ford ahead and pull the farm implements from the rear. You do not deface your Ford in any way. You do not injure its wonderful ability, but merely utilize its low cost of operation to give the cheapest form of doing farm work.

Use Smith Form-a-Tractor now for

Plowing	Spreading Manure	Cultivating	Grubbing	Crushing Clods
Mowing	Pulling Trees	Smoothing	Packing	Pulling Binders
Listing	Hoisting Hay	Drilling	Rolling	Pulling Stones
Disking	Hay loading	Irrigating	Spraying	Ditch Digging
Dragging	Stretching Wire	Loading Logs	Grading	Hauling Crops
Leveling	Pulling Diggers	Pulling Stumps		

and any other farm work that you have been doing with horses.

Smith Form-a-Tractor drilling—four horse work.

50,000 This Year

20,000 Smith Form-a-Tractors are now being built, even before this announcement.

50,000 will be sold this year.

Smith Form-a-Tractors will cut the cost of doing farm work from 40% to 70% on any farm in the country, large or small.

Use Smith Form-a-Tractor for your farm work—Smith Form-a-Truck for your farm hauling, and all the wasteful expense of horses is eliminated.

Wonderful Design

In quality—workmanship—design—materials—Smith Form-a-Tractor gives you tremendous value.

The special cellular type radiator, ten times as efficient as the regular Ford radiator, guarantees perfect cooling in all kinds of work, under all weather conditions. Even on the hottest days you can plow at the rate of seven acres a day with absolute certainty, where horses can only plow 4 acres, with the constant fear that they will drop dead in the harness from excessive heat.

The patented Force Feed Oiling System guarantees perfect lubrication—freedom from burned out bearings, scored pistons. These two features are absolutely essential to proper tractor operation.

The tractor wheels are exceptionally wide, equipped with strong, durable lugs for service in soft soil, the roller pinions meshing with the bull ring gear of the tractor wheels, are made of nickel steel, heat treated.

The tractor axle is back of the Ford axle. The driving power of the pinions is exerted downward, keeping strain away from the Ford and giving utmost efficiency.

Remarkable Power

Eleven-to-one gear reduction through the use of the Smith Form-a-Tractor roller driving pinion gives wonderful working power. Two and one-half miles an hour in plowing, binding, drilling and all other farm work—eleven times the pulling power of the Ford.

Smith Form-a-Tractor will start and work continuously, hauling a 28-inch gang plow or doing any other four-horse work, and do it all on high gear. We absolutely guarantee this amazing feature of performance.

Smith Form-a-Tractor discing—four horse work

Deliveries Now

You need your Smith Form-a-Tractor now, when you are busiest in the field, doing your hardest work. We can take care of your demands. Our big, complete dealer organization covering every section of the farming territory is ready to supply your demands immediately.

You can order from our dealer in the morning and have your Smith Form-a-Tractor at work, radiator installed, oiling system in, and the tractor itself ready for work in the afternoon of the same day. The first 12 hours you work Smith Form-a-Tractor will show you just what a tremendous saving it will make for you in your farm work.

If you cannot get in touch with a dealer quickly enough, send us the coupon. Accompany it with a deposit of $10 and we will ship your Smith Form-a-Tractor immediately, subject to payment of sight draft attached to bill of lading. Whatever you do, get Smith Form-a-Tractor working in your fields just as quickly as possible.

FARM RUN BY W POWER.

SNATCHING power free from the air to light innumerable electric bulbs in home, barn and outbuildings; to operate sheep-shearing clippers, stove-wood saw, churn, turning lathe, fanning mill, washing machine, feed grinder, electric fans, emery-wheel grinders and other time and labor-saving devices; to provide the motive power for an electric automobile and in many other ways to save back-breaking and money-costing labor, the electric farm of Mr. J. F. Forrest, of Poynette, Wisconsin, is so unusual as to deserve the fame which has come to it and its progressive owner. Mr. Forrest has to thank two large windmills for the inexhaustible power which he has had for the past seven years, practically without cost, save that of the original installation of his equipment.

It is now over seven years since Mr. Forrest decided that it was no longer necessary to carry an oil lantern with him when he had late chores to do, or was called out to barn and outbuilding in the evening or early morning. There was the constant fear of an overturned lantern, of flames leaping high, of barn and feed and stock consumed in a twinkling. What would he not give for a safe, cheap, convenient lighting system upon which he could depend, night after night, week after week? Mr. Forrest was mechanically inclined. He was not dependent upon the ingenuity of other men. As he sat in his comfortable farm home and heard the wind whistling through the trees, or soughing under the eaves, the thought came to him that here was nature's power, simply waiting to be set to work by man.

It was not long before he set about his task of harnessing the wind to do his work and bidding. An electric concern installed a power windmill on his farm. From that day to this Mr. Forrest has never been without his lights or his p wer to operate small machines.

The power plant today at the Forrest electric farm consists of a dynamo, cut-in and storage batteries, harnessed to two large windmills. The first windmill erected has a steel wheel twelve

SIXTEEN-FOOT MILL ON A FIFTY-FOOT TOWER FURNISHES ELECTRIC POWER.
(Insert, photograph of Mr. J. F. Forrest, of Poynette, Wis.)

feet in diameter and geared up so that the vertical shaft makes five revolutions to one of the wind wheel. The windmill is placed high, in order to obtain the fullest possible exposure to the wind in all directions. The dynamo is located on the second floor of the powerhouse, to which the windmills are attached, and is operated with a pulley on the upright shafting. The cut-in is an instrument which is placed between the dynamo and the batteries, operating very much like a check valve in a water pipe. This allows the electric current to pass into the batteries, but allows none to pass from the batteries into the generator. The battery consists of fourteen cells, having seven plates in each glass jar. When these were set up they were given their initial charge from the windmill. This battery has supplied light for the house, barn and barnyard for over seven years, without interruption. Even when there is no wind for days, there is enough electric current stored in the battery cells to last a full week.

Having proved out his experiment so conclusively, Mr. Forrest decided to go still further. He concluded that the electricity generated by the winds aloft could, and should, do more of the farm work for him. Accordingly, he bought and installed a second power windmill. This second windmill has a sixteen-foot wheel. This wheel, running a dynamo regulated by a governor, generates a power of 110 volts, whereas the other generates only twenty-five volts. This new power plant has many duties to perform and performs them regularly and creditably. None is more useful or unique than the duty of charging the Forrest family automobile, enabling the owner to run the car an average of about twenty-three miles without recharging. Perhaps the manner in which this automobile is put to its various uses may best be told by Mr. Forrest himself, as follows:

"This car is not only used as a conveyance, but the batteries are plugged to a wiring system which extends to the different buildings, and electric motors operate machinery, such as the washing machine, churn, vacuum cleaner, fanning mill, emery-wheel grinder, sheep-shearing clippers, electric fans, turning lathe and a stove-wood saw. The battery in this car has forty cells, eleven plates in each cell, and will give over eighty amperes, which is equal to over eight and one-half horse power. This is sufficient power for a 24-inch saw to cut off dry oak wood as large as the saw will reach through.

"A 12-foot wheel on the windmill is about right size for a 30-volt system, a 14 for a 60 and a 16 for an 80 to 110. It is not necessary to place these mills over the well; therefore, they can be placed on a near-by hilltop, where the wind exposure is the very best. Wires can be run thence to wherever power or lights are needed. With this system, farmers who have not had windmill service on account of obstructed wind exposure can do things electrically.

"Everything now suggests intensive farming. Farming is made up of gathering together the little things. The windmill is strictly along this line. In driving through the country we often see pumping windmills which are sort of make-shifts or make-believes, and are failures, so far as efficiency is concerned, being undersized, with low towers and, therefore, incapable of doing

(Concluded on page 18.)

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Advantage of Muffler Cut-Out.

I have a forty-six horse-power Paige car. I am thinking of putting on a muffler cut-out. Would it increase the power, and is there any benefit to the engine?

Answer.—When the muffler cut-out is open there is less back pressure on the engine and consequently the engine has more power. It does not affect the power of the engine when closed. It is useful in climbing hills or at other times when excess power is required. On account of the noise of the exhaust nearly all cities have ordinances forbidding the use of a car on the city streets with the cut-out open.

Slow Corn Shelling.

I bought a four-hole "Keystone" second-hand corn sheller a year ago which was nearly like new. It was run by a six-horse gas engine when I got it. I changed it to an eight-horse Morsell horse power. It seems that it gets motion enough and runs fine, but it shells very slowly. It does not seem to take the corn fast enough. Please tell me what is the reason that it does not take the corn faster?

Answer.—It must be that the sheller is running at too low a speed. The easiest way to speed it up would be to hitch the horses nearer to the center of the horse power, so that they will not have to walk so far to make one round.

Making Lead Stick to Tin.

Is there anything that will make lead stick to tin when soldering? If there is, where can I procure it?

Answer.—An excellent soldering fluid is made by dissolving granulated zinc in muriatic acid. You can obtain them at a drug store. Use all the zinc that the acid will dissolve. While dissolving the zinc gives off a gas that is highly explosive if ignited. When soldering, carefully scrape the parts to be soldered until they are bright and free from rust and dirt. Apply a little soldering fluid and heat the parts with a blow torch or soldering iron until nearly hot enough to melt solder. Then apply the solder to the parts with a hot soldering iron having a well-tinned point. Half tin and half lead makes a good solder. If you have trouble making the pure lead stick, tin the surfaces with half-and-half solder before applying the lead.

Size of Ford Lights.

Would you please give instructions as to what size and kind of bulbs to use for side and tail lights to be run from a Ford magnto? Can you give me the address of a company that handles repairs for the Flanders motorcycle?

Answer.—If your car was made before 1915, use six-volt, twelve-candle-power bulbs for the side lights, connected in series, and a twelve-volt, two-candle-power bulb for the tail light, which must not be in series with the other lights, but connected direct to the magneto. If you have a car of 1915 or later model, use eight-volt, two-ampere lights for the side lights and a two-candle-power, sixteen-volt lamp for the tail light. The above is for tungsten lamps. It is also assumed that either the headlights are supplied from some other source or that headlights were meant instead of side lights. It would not be advisable to try to run both side lights and headlights from the magneto.

We do not know of a company handling the repairs you mention. You had better write direct to the manufacturer.

Six-Horse Evener.

Can you give a description of a six-horse evener, four abreast and two in the lead?

Answer.—This evener is very easily made. Obtain six twenty-eight-inch singletrees and three ordinary doubletrees. Couple two singletrees to each doubletree in the usual manner. Obtain a piece of oak 2x6x72 inches. Bore the end holes four inches from each end and the other hole at the middle. Couple a doubletree to each of the two end holes. Obtain a chain long enough to reach from the middle hole of the seventy-two-inch bar to the other doubletree placed ahead of the four horses. The chain should have a ring at each end. Fasten the front doubletree to the chain by passing the clevis through the ring; fasten the rear end of the chain to the middle of the seventy-two-inch bar by passing a U-shaped strap through the ring of the chain. This strap should be made of iron about two inches wide and one-half inch thick. It should have holes in the ends to take the clevis pin that passes through the middle hole of the seventy-two-inch bar.

Connecting Lights and Ammeter.

I have a "Genemotor" on my Ford car. I wish to install on the dash an ammeter showing charge and discharge. How shall I wire it? There are two large wire cables runing from the generator to the battery. Should I wire from each of these to the ammeter? I am going to put a spot light on my wind shield. Should I wire this from the two small wires which run from the storage battery to the other lights?

Answer.—Your idea of how to wire the spot-light is correct. Ammeters are usually placed in series, not in parallel as you suggest. That is, instead of connecting it between the two large wires you should cut one of the large wires and connect the ammeter to the two ends. In order for the ammeter to show both charge and discharge it would then be necessary to disconnect one of the light wires from the battery and connect it to the large wire between the ammeter and the generator, so that the current in flowing to the lights would pass through the ammeter, while the current from the generator to the battery would also flow through the ammeter.

A High-Wheeled Auto.

Please tell me through the Farm Mechanics Department whether it is possible to make a high-wheeler auto out of a Ford car so that it will go through muddy roads better than an auto with ordinary tires. My idea is to put a Ford engine in one of the old-style high-wheeled autos; and rig it up to use on a mail route when the roads are too bad to use a regular Ford. Please give a sketch of how to arrange it. What size wheels should be used?

Answer.—The figure shows the general arrangement of the outfit. R is the radiator, M the motor, T the transmission, P the propeller shaft of the Ford car, which would have to be shortened; S S are small sprocket

wheels on the ends of the Ford axles, D is the Ford differential, L L are the large sprocket wheels, R R are radius rods that keep the sprockets the correct distance apart. They should be adjustable, to take up the wear of the chain. The same springs and front axle are used as on a Ford car.

Using rear wheels forty-four inches in diameter, the sprockets, L L, should have about three times as many teeth as the small sprockets, S S. A good combination would be fifteen teeth in S and forty-five teeth in L. It is perfectly possible to make an outfit of this kind, but a great deal of labor would be required, and unless you have a shop of your own, it would prove an expensive experiment. The high-wheeled car was not considered much of a success.

Lighting From Magneto.

Can you tell me how to get a light from a magneto on a gas engine? It is a Wizard, Type A. The magneto has a friction governor pulley that runs on the flywheel. The engine runs 200 R. P. M.

Answer.—The above magneto is a fairly large direct current magneto and you might derive some lighting current from it. If it runs very steady you might wire the light direct to the magneto connecting the two terminals of the magneto to the two terminals of the lamp socket. A switch should be placed in the line. Use No. 14 rubber-covered wire to make the connections. A better way would be to charge a storage battery from the magneto and run the lights from the battery. Care must be taken to connect the positive pole of the magneto to the positive pole of the battery. Also the battery must be disconnected from the magneto before the magneto stops running, otherwise the current will flow backward from the battery through the magneto and demagnetize the magnets.

The proper voltage and candle power for the lights could best be found by measuring the voltage while the magneto is running by connecting a voltmeter across the terminals of the magneto and measuring the amperage by connecting an ammeter in the circuit having resistance and gradually cutting down the resistance until the armature of the magneto began to show signs of heating. Any dealer can tell you the amperes required to run a bulb of the voltage you find you require. If you cannot obtain an ammeter and voltmeter you might try a six-volt, six-candle-power light. If the light does not burn bright enough the voltage of the lamp is too high. If it burns out the voltage of the lamp is too low. If the magneto shows signs of overheating the candle power of the light is too large for it.

FAMILY CIRCLE TALKS BY THE PUBLISHER

NORTHERN WISCONSIN'S GREAT OPPORTUNITY.

I LOOK for the greatest era of development northern Wisconsin has ever known to come immediately after the great European war. Every great war and political convulsion in Europe has been followed promptly by an increased migration to the United States. This was the situation right after the Franco-Prussian war and, later on, the establishment of the German empire. I am convinced that it is bound to occur again after the great war shall have come to an end—hasten the day!

That being the case, we, here in Wisconsin, confront a period of activity and prosperity within the next few months, or year or two at most (for the war can hardly last longer than that, at the very worst), for which we should be amply prepared, in time. The men and women of northern Europe, who shall come to this country, will look for land which they can get under cultivation and into production with the least delay. They will need to live near to market, so as to lose no time in selling their product and obtaining the ready money of which they will stand in sore need, after that which they brought with them has been expended for land, stock and implements. The only possible rival to northern Wisconsin would be the South. But the South is not nearly so far advanced agriculturally and economically as the North. In many parts of the South conditions still remain actually primitive. Labor is hard to obtain there and much of it is inefficient. Unless the federal farm-loan banks live up to the fullest expectations, money will continue to draw much heavier interest there than it does here in Wisconsin. Southern markets are further removed from the cheap land than are the markets to which northern Wisconsin ships. Every advantage is on our side. Consequently, I look for the pick of the emigrants to come out here and cast their fortunes with us, on the 10,000,000 acres of tillable land, now uncleared, which northern Wisconsin offers to the plow and to profitable production.

With the prospect being as I have outlined it here, I firmly believe we should lose no time in preparing for the influx of new settlers and the increased Wisconsin crop production which is sure to come. In The Wisconsin Farmer of last week I printed the splendid letter which Mr. A. D. Campbell, manager of the Wisconsin Advancement Association, sent to Hon. Wm. C. Redfield, secretary of commerce in President Wilson's cabinet. I want to reprint two paragraphs, for they show the possibilities of northern Wisconsin in one crop alone most strikingly. Mr. Campbell wrote:

Let me say to you if we can get proper activity in the matter of further clearing of Upper Wisconsin land of stumps we can grow enough additional potatoes this year to feed at least 500,000 United States soldiers for a year following harvest next fall.

There are now at least 50,000 farmers in Upper Wisconsin who have land otherwise cleared than of stumps and there is no good reason why each one of them should not clear more land of stumps and plant potatoes this year. I know that people who are not familiar with modern machinery for pulling stumps will say this is a slow and hard proposition, but I call your attention to the fact that three men and a team can pull from two to three acres of stumps in a day and that the land will grow from 150 to 200 bushels of potatoes to the acre if only reasonably cultivated.

That is the situation, as it refers to potatoes alone. But Wisconsin produces vast quantities of other crops. We are the leading dairy state of the nation. Think of the untold millions that can, and will, be added to our annual crop wealth when these cut-over lands of ours are put under cultivation, are dotted with farm homes and are teeming with men and women thanking God every day of their lives that they are far away from blood-soaked Europe, in a country where there is work and a chance to live and enjoy life for every man, woman and child under the stars and stripes.

The next few years are going to be the biggest and busiest northern Wisconsin has ever known. Get ready for them, so that opportunity will not wear out its knuckles rapping at our doors.

THE OLD-TIME HERB DOCTOR

A FEW weeks ago we discussed the merits, and the taste, of sassafras bark, for which I admitted having no love, notwithstanding its good effects on the human body in the spring, when our blood is too thick and we need a little rejuvenation. I have had many interesting letters on the subject of sassafras in particular and medicinal herbs in general since then. One of my correspondents asks the pertinent question: "What has become of the old-time herb or 'yarb' doctors, who used to be such common sights in the country, but who now seem to have passed away almost completely?" I am going to pass the question on to my readers. Is the old-fashioned herb doctor (gathering his tansy, ginseng, sassafras and pennyroyal) to be seen in your part of the country yet, or has the odor of gasoline driven him completely out of existence?

It is rather a coincidence that, just while this subject was fresh in my mind, the writer from whom I quote so frequently in these columns, David Grayson, the rural philosopher, should have published an article in The American Magazine, in which he describes the very man for whom we are searching: The old-time herb doctor. I do not want to weary you with Grayson, but let me quote just a little bit of what he says about the herb man, whom the sassafras bark has brought back to our minds just recently:

A strange old man, a wanderer upon the face of the fragrant earth. Spring and summer he wears always an old overcoat, and carries a basket with double covers, very much worn and brown with usage. His cane is of hickory with a crooked root for a handle, this also shiny with age. He gatners bitter-bark, tansy, ginseng, calamus, smart-weed and slippery elm, and from along old fences and barnyards, catnip and boneset. I suppose he lives somewhere, a hole in a log, or the limb of a tree, but no one knows where it is, or how he dries or cures his findings. No one knows his name: perhaps he has forgotten it himself. A name is no great matter anyway. He is called simply the Herbman. He drifts into our valley in the spring, is seen here and there on the hills or in the fields, like the crows or the blackbirds, and disappears in the fall with the robins and the maple leaves. Perhaps he is one of those favored souls to whom life is all spring and summer.

The age has passed him by, and except for certain furtive old women, few care now for his sovereign remedies.

I met him once in the town road, and he stopped humbly without lifting his eyes, and opening his basket let out into the air such a fragrance of ancient simples as I never smelled before. He said nothing at all; but took out dry bundles of catnip, sassafras, slippery elm, to show me. He had also pennyroyal for healing teas, and calamus and bitter-bark for miseries. I selected a choice assortment of his wares to take home to Harriet, but could get him to name no price. He took what I gave without objection and without thanks, and went his way. A true man of the hills.

With this interesting sketch as a starter, cannot some of my readers tell me of such men in their communities, either as they existed yesterday, or as they exist today, if they are still to be found in our midst? The old "yarb" doctor was not without value in his time, for there are many simple, yet effective, nostrums compoundable from the medicinal herbs to be found alongside our roads and which even prove to be well worth while, financially, for some farmers to grow for the market. We were all better off, in some respects, in the days when we turned to the kitchen cabinet or "safe" for concoctions of old-fashioned herb-remedies than we are nowadays when proprietary medicines, often containing habit-forming drugs, are to be had so easily by all, regardless of the harmful effect they may have on our system at the time, and the drug habits they may lead us into. Medicine has an important place in the world, but the less we can get along with the better. Maybe the old herb doctors had more common sense than we gave them credit for, after all.

At any rate, if this subject interests you or brings up memories, write to me. Here is a chapter of country life which may be very interesting, indeed, if we go into it deep enough, together.

WHAT IS SUCCESS?

I HAVE often thought of what constitutes success in life. It certainly is not the mere piling up of wealth, for many a modern Midas would gladly give all his millions for the comradeship of friends, the respect of society, the capacity for enjoying the finer things of life, or even for a good digestion. Yet, even the possession of all these things does not alone comprise success. For, as a contrast to the unfortunate rich, I know of a Wisconsin man who has a wide circle of friends, a strong character, and a fine appreciation of the good things of life that command their respect and admiration, and an appetite and digestion of the best, yet he will always feel that he was a failure, because he lacks some of the elements essential to business success. I think that we try to apply the term "successful" too broadly. We must consider the various kinds of success which a man can make, for, in this age of specialization, no man can be highly successful in very many different lines. But in its broader sense I think the best test of success is whether or not we make the most of our opportunities, whether we use what gifts providence has bestowed upon us to the best advantage. According to this standard, a czar who fails to use his power and position for blessing his people with the gifts of liberty and prosperity is a rank failure, while a crippled child of the slums, who rises above his environment and physical handicap, and makes himself a useful member of society, is a glorious success.

Not long ago I had the privilege of reading a letter which brought this fact home to me with renewed emphasis, and also suggested that it is not so much physical gifts which bring the richest things that life affords, as it is the gifts of mind and soul. The following letter is from Helen Keller, who, as my readers know, has been blind, deaf and dumb from infancy, but who has become one of the most inspiring examples of American womanhood. It was written to a friend of mine as Miss Keller was passing through the Rocky mountains, and I regard it as one of the best descriptions of the rugged beauties of our American Alps and one of the finest gems of letter writing I have ever read. Somewhat against his wish I begged a copy that I might share it with my Wisconsin Farmer readers. It reads, in part:

On the Backbone of the Continent, March 1, 1917. Dear Mr. Bemler:—I am writing now on the road to Provo, Utah. We have been climbing the Rockies since noon, and soon shall be 14,000 feet above sea level. My mother keeps stopping me to describe the mountains, and they are wonderful as they crowd about us on both sides, their snowy summits glistening in the sunlight. We just passed three imposing peaks on one side, called Princeton, Harvard and Yale. The greater part of the way the landscape is wild, bare and desolate. We come to gulch after gulch where the rocks soar out of sight into the blue sky. They are of all shapes imaginable. Some look like huge grazing cattle; others are like sphinxes and others like turrets and spires. My mother just saw some rocks scattered about exactly like tombstones in a vast cemetery. For miles and miles there is no sign of vegetation or "flower in the crannied wall." But sometimes the mountains are covered with small cedars, and at the foot are cattle in the field. Now it is sunset, and the mountain tops are glowing like opals. I wish that you could be with us to enjoy it all—the splendor, the exhilaration, the sense of new power that this height and breadth and sweep of the elements imparts to us. Sincerely yours, HELEN KELLER.

It seems as if, by some magic sixth sense, more than compensating for those which are lacking, she had grasped the sublime beauty and overpowering grandeur of the mountain scenery, which would have left others of us, with all our natural gifts, unmoved or powerless of expression.

Some weeks ago I published a letter from one of my Wisconsin readers who had been bereft of one of the bodily gifts which the most of us enjoy, but who wrote me in a tone of such cheery optimism that it was enough to shame me into a spirit of greater thankfulness for my own physical blessings. Now, again, a letter from one, even less fortunate than my Wisconsin correspondent, should make us feel humble that, with eyes to see and ears to hear, we, many of us, go through life missing the beauty and the pleasure which she senses without sight or hearing.

It makes me wonder if, after all, the obstacles which we conquer are not really blessings in disguise, and if it is not only through pain and struggle that we can come to the finest appreciation of the blessings and beauties which surround us. At all events, I am more convinced than ever that success is not entirely to be measured by what we achieve, but that the Master set the real standard of success in his parable of the talents, as something to be tested by the way in which we use the means which are given us.

REVIVE BADGER FARMERS' CLUBS.

IT HAS come to my knowledge that a number of farmers' clubs in Wisconsin have been permitted to die out within the last year. For this I am indeed sorry. There is, in my judgment, a legitimate field for the farmers' club, whether it works along literary lines or practical agricultural lines, or both. I know that the past winter has been a severe one and that many of our folks in Wisconsin have been snowbound for days at a time. I know also that it has been a busy season in the woods, and our good women do not always find it interesting to conduct their clubs alone.

I am a firm believer in organizations. In my judgment, the farmers of our state have not given

(Concluded on page 5.)

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-in-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of 100 or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address

The Wisconsin Farmer Madison, Wis.

Active Defense Work in Wisconsin.

Something over a week's work on the part of the Wisconsin Council of Defense, established by special act of the legislature, has developed a splendid line of constructive work. One work of great importance has been the distribution of potato seed at $3 a bushel, about $1 a bushel below the current markets, and more than 15,000 bushels were sent out in a week under the direction of the Wisconsin Department of Agriculture. The department has a gentlemen's agreement with dealers and shippers for an option on practically all the unsold potato seed stock in the state. Furthermore, the department has power, and has indicated a disposition, to seize any stock which is apparently being held in storage for higher prices, and distribute the same at as low a price as is possible. The war brings on unusual conditions, and these may be expected in other lines as well as in the potato business. The warehouseman who gets $3 a bushel for potatoes ought not to kick even though he has an idea he could get $5 a bushel by waiting and holding the seed a little longer. Another important measure to conserve the potato seed stock is the plan to save the seed ends of potatoes used for the table. County Agent G. M. Householder has inaugurated this plan in Rusk county. The seed ends are, of course, small in weight, most of the flesh being turned into food. But even with a seed end weighing not over one-fifth to one-seventh of an ounce, germination will follow planting if the soil is properly pulverized and the seed end planted not to exceed three or four inches in depth and about ten inches apart in the row. The potatoes raised from this stock will be good for table use only. The department of agriculture, county agents and banks and other agencies have not only cooperated to relieve the shortage of potato seed but have also brought in spring wheat seed in carload lots.

The Wisconsin Council of Defense, acting through the college of agriculture, is fathering the Emergency Food Agent. Eleven counties are enlisted in this campaign. The agents already appointed are:

Milwaukee county, F. J. Sievers, Wauwatosa; Racine county, C. F. Fawcett, Rochester; La Crosse county, T. H. Campion, Onalaska; Wood county, W. A. Clark, Grand Rapids; Marinette county, W. F. Morton, Marinette; Marathon county, R. A. Humphrey, Wausau; Dunn county, Theodore Sexauer, Menomonie; Chippewa county, W. C. Bradley, Hudson; Grant county, C. C. Burns, Platteville.

Most of these gentlemen represent the county agricultural schools. Mr. John Imrie, of Roberts, Wisconsin, has been tendered an appointment, but at the time this is written his reply had not been received. The county agricultural agents will take up the work in such counties as have agents. It is expected that within a few days more than half the counties will have an Emergency Food Agent actively at work in the field.

But it will be up to the individual farmer to really accomplish something in the way of greater production. The emergency food agents will be able to accomplish more in the cities and villages than in the country. The fact is, the farmers of the state have already decided to do their best. It remains for the idlers in the cities and towns to do their share to swell production. No one will be able to say that the farmers of the state are "slackers" on the proposition of producing food this season. The real work will consist in organizing those citizens who are now either unemployed or engaged in pursuits which will not help the country in this time of emergency.

Purely as a war measure the Wisconsin Highway Commission has recommended that the state go slow in expending money for new roads this year. The following statement has been sent out to county commissioners:

1. It is not a time to press road or bridge construction.
2. Road construction should proceed at the rate necessary to hold together the present state and county road organizations and to utilize present equipment.
3. While labor and materials are high there is no certainty that conditions will be better in 1918 or even in 1919.
4. In every county the demands made for labor and the prices paid for labor and teams on road work should be so regulated and safeguarded that the farmers will not be handicapped in holding or securing the men they must have at a price they are able to pay.
5. Maintenance of what we have built should be fully attended to.

One reason for a partial suspension of road work is that the officers of the state do not wish to further embarrass the labor market. Furthermore, materials and labor are too expensive for economical road building, in the opinion of the commissioners. Keep what we have in good condition, take care of the dirt roads and proceed with caution, is briefly the recommendation of the commissioners.

Wisconsin Legislature.

The proposed legislation to control tuberculosis in cattle will pass through another hearing before the agricultural committee this week before being reported favorably or unfavorably by the committee on agriculture.

Farmers and laborers will be represented on the university and normal school board of regents by the bill introduced by Representative Metcalf and passed by the legislature. This bill provides for two farmers and two representatives of labor on the university board and three farmers and three representatives of labor on the normal school board.

The agricultural committee reported without comment the skim milk cheese bill, introduced by Mr. Grell, providing for the manufacture and branding of skim milk cheese. This will leave the discussion on the bill open to the assembly when the bill comes up. The bill provides for the proper labeling of skim milk cheese and necessitates a license for its manufacture.

Rendering plants in cities, excepting those of the first class, will henceforth come under the rule of the state board of health. The legislature has given the board the power to inspect and examine any rendering plant in the state. In case the plant is found to be insanitary or located where it is a nuisance and dangerous to public health the health officers can do what in their judgment is best to remedy the matter of operation and make provisions which will protect the public health.

The Grell bill relating to unfair discrimination in buying milk, cream and butter fat has also been passed by the legislature. Under the law now any person or corporation buying milk, cream or butter fat for manufacture and paying for such purchases a higher price in one section than it is paying for the same commodity in another is liable to punishment under the state laws. Allowance is made for the difference in transportation costs. This will help some to do away with unfair discrimination and the creating of monopolies in various sections.

Another weed bill will soon come up in the legislature, having been reported out of the committee of agriculture last week without comment. This weed bill differs from the various laws on the books in that it provides that county boards must vote against meeting the demands of this bill or otherwise be subjected to the rulings of the bill. Voting for it or not voting at all makes the provisions effective in each county.

Northern Wisconsin settlers are given assistance by the bill passed by the legislature permitting the department of agriculture to purchase dynamite and other explosives for distribution at cost to bona fide settlers. A further measure was also passed providing for an investigation on the feasibility of state manufacture and distribution of explosives. The report on this will be made at the next legislative session.

The highway bill providing for a trunk system mentioned in last week's issue was passed and is now a law, but a provision has been attached that in case the governor or the highway commission think expenditures unwise at this time the work can be postponed.

The assembly rejected an amendment made by the senate to the bill introduced some time ago for the widening of sleighs. The assembly measure provides for the width to be increased to four feet and six inches without exceptions, while the senate would leave this optional with the county board. The measure will have to pass the senate again before it becomes a law.

The senate bill introduced by Senator Skogmo providing for a state brand of butter and cheese met sudden death at the hands of the finance committee. This puts the bill out of running for favorable action at this session of the legislature, but no doubt something of this nature will be passed during the next session. There is considerable argument in favor of a state brand and its success in Iowa, Michigan and Minnesota cannot be disputed.

Woman suffrage is to be submitted to the voters of Wisconsin in April, 1920. Both the house and senate have passed the bill. In its original form the question of suffrage was to be submitted in 1918. The senate changed this to 1920 so that another legislature will have an opportunity to consider the matter before it is finally submitted.

A Suggestion to Governor Philipp.

The Green Bay Local of the American Society of Equity has forwarded Governor E. L. Philipp a letter, pledging united support along the line of producing just as big a food crop in Brown county this year as is possible. While pledging their united support the society also makes the following suggestion to Governor Philipp:

We ask your assistance to give us an opportunity to deliver our products to the consumers, whether they may be on the battlefield or in the workshop, at a price that will be equitable to both the producer and the consumer. You can do this by recommending to the legislature now in session the passage of a law making the buying and selling of options, the gambling in farm products, a felony by law with adequate punishment for such offenses.

Will you do this in justice to the great number of farmers not alone in Wisconsin, but throughout the United States, as well as for the millions of consumers, who are now suffering because of the present conditions and rules of marketing farm products, together with the artificial prices now fixed by the combines?

The Green Bay Local has raised a point, which, in our judgment, the governor and the State Counsel of Defense cannot afford to overlook. It would indeed be a crime if the farmers of Wisconsin and the nation should raise a tremendous crop this year and still none of the food products could be placed in the hands of the consumer at a reasonable price. The Wisconsin Farmer has no word of censure against the fair jobber or dealer. We also believe that the warehouseman and the storageman should have a fair compensation for the service which they render. But the food gamblers and the warehousemen and storagemen, who simply hold up foods in times like these for speculative purposes, should be put out of existence. There are some who cry against the American Society of Equity. They should remember that it is the food gambler which makes such societies necessary. Eventually, farmers will unite and market their own products if there continues to be such a tremendous difference between the price of food as it leaves the farm, and the cost as it enters the home of the consumer.

War will, no doubt, regulate many things. Not the least important of these is likely to be a readjustment of marketing, whereby the farmer gets better pay for his labor and investment and the consumer secures lower prices.

Looking Ahead to Silo-Filling Time.

It is a well-known fact that in many localities the labor problem connected with silo filling has been solved by groups of farmers who work in a cooperative way at silo-filling time. It is simply a question of Jones helping Brown and both Jones and Brown helping Smith, and so on until every silo is filled. This plan has worked well and it has made possible the saving of a large amount of roughage that ordinarily would be wasted. As a rule, silo owners plan definitely on putting the product of a certain field into the silo. They use a variety of corn that is best adapted to that end and such a field is usually planted so that it will reach maturity at a time when it will be most convenient to fill the silo.

The Wisconsin Farmer has a suggestion to make to all those who are members of these so-called silo groups. Every field should be planted so that it will mature so as to fit in best with the silo-filling operations. Ordinarily it will take from two to three weeks to fill the silos in one group and if the individuals in a group will get together and map out the order in which the silos will be filled, then it will be wise to take the precaution of planting the fields in the same order in which the silos will be filled. If this plan is carried out it will mean that all the corn will be put into the silo in the proper condition, whereas if it is all planted at the same time a considerable part of the fodder will be too mature to make the best kind of ensilage. While it is practicable to add water to ensilage that is made from mature corn, it is nevertheless a well-known fact that the best ensilage is made from a high-yielding variety of corn that is cut just after the lower leaves begin to mature. There will be sufficient succulence in the product to insure it keeping well and by putting it up in this condition one will avoid that loss that is always associated with the complete maturity of the leaves and stalks.

Let Your Farm Paper Help You.

There will be no contradiction of our statement that there is a keener interest in agriculture in Wisconsin at this time than ever before in the history of the state. Unusual events have brought on this special interest. Farmers everywhere are realizing that they owe a duty to their country and that this duty can best be performed by heavy production of foodstuffs. Every agency which can help is putting its shoulder to the wheel. In a time like this the farmer leans heavily upon his farm paper and The Wisconsin Farmer is glad that this is so, primarily for the reason that it makes us a part of the patriotic army now at work for our government and for the world. The publisher and the editorial staff accept the added responsibility with the devout hope that they may be of some practical assistance to the thousands of farmers in the good old Badger state this year.

Our readers may depend upon it that we will do everything possible to make the columns of The Wisconsin Farmer not only interesting and [illegible] able but also helpful in the ma[illegible] of agricultural activities. The Wisconsin Farmer mail, including inquiries from subscribers, was never so heavy as it has been the past few weeks, and this is an indication to us that our readers are glad to avail themselves of the service which the editorial staff offers. The Wisconsin Farmer is always glad to receive communications from readers on any topics which would be of general interest. We are also always glad to have discussion on any articles which appear in the columns of the paper. If your neighbor does not take The Wisconsin Farmer, ask him to join us. If for any reason you have neglected to renew, do so at once, so that no issues will be missed.

FAMILY CIRCLE TALKS—By The Publisher.

(Continued from page 3.)

sufficient attention to the subject of organizations—such organizations as would look after their own interests. We cannot afford to give up our social life in the country. It is necessary for the young folks, and I believe it is just as necessary for the older folks. No man or woman becomes so narrow-minded as the one who crawls into his shell and has nothing to do with his neighbors, has no part in the business of the community, or takes no interest in the topics which are of greatest importance to those who reside in his neighborhood. In my judgment, it certainly pays to brush up against our fellows and exchange ideas and experiences. These good ends may be accomplished through the medium of the farmers' club, and I am always just a litle bit discouraged when I receive a letter to the effect that some club has disbanded or been allowed to go by default because of lack of interest of the members.

One of the commonest causes for failure of farmers' clubs is the fact that a few leaders do all the work and the others simply follow. If, for any reason, the leader or leaders move away, the club dies. Or, perhaps there may be a feeling created that some of the members are trying to run it all, and I have known many instances where this has resulted in lack of harmony and a subsequent lack of interest in the club.

I would not, for one moment, disparage the good work which some of our leaders do in getting a club organized. But the point I wish to emphasize is that when a club once gets on its feet, there should be something for most of the members to do. To sustain interest the duties of the club must be distributed and not carried by a few members. I know that some of my readers will say, "We have a lot of members in our club who cannot be induced to do anything." Well, in my judgment, that depends a good deal upon the way we get at them. Almost any member of any club has some ideas regarding club work. Why not be free to express these ideas? Make yourself at home in the work of the club and you will soon begin to enjoy it. Our place in these organizations, the same as our place in society in general, is largely what we make it. If we attend the club meeting, sit back in the corner and have nothing to say, save possibly an occasional biting word of criticism, how can we expect to get any good out of the club?

There are always a few people in each neighborhood who are just a wee bit smarter than others. Perhaps they have had better advantages. Such people should be big enough and broad enough to recognize the ability in those who have had lesser advantages and may be somewhat backward in their manner of speech or expression. Why not all work together to help those who are the weakest? If such a spirit can be developed in any club, I have no fear that a report will come in that the club has been disbanded, or that the meetings have been discontinued for lack of interest.

At this time, here in Wisconsin, there is an added interest to club work and all social and public gatherings. I refer to the patriotic interest. I wish to renew my previous offer to furnish, free, copies of the words of "America" to the secretary or any other authorized officer of any club. If my readers, who meet at these clubs, do not know "America" by heart, they should not let many more days go by until the grand old hymn—every line of it—is at their tongue's end. Send for copies of "America" and be sure and use them the next time there is a club meeting. I am always glad to have letters from club members regarding the work they are doing and the topics which create the greatest interest.

James M. Pierce

WISCONSIN FARMERS' CLUBS

Letters From Our Club Workers, and a Few Pointers on the Topics Discussed.

THERE is something wrong with the community that cannot show some organization or club which is a medium for the residents towards closer acquaintanceship. Sauk county points with pride to its twenty-five clubs and organizations which help the residents of the county to know each other and meet with each other for social and business reasons.

The Skillet Creek Farmers' Club, located in the district a few miles outside of Baraboo and named after a creek flowing through that section, is a typical example of a farmers' club which is at the same time social and educational. The motto of the club, "We can do it ourselves," aptly expresses the purposes for which it was founded. Though only started in 1905, the neighborhood was not without an organization of some kind for forty-six years. In 1870 or thereabouts the first farmers' club of the neighborhood, called the Skillet Creek Farmers' Club, was founded and lasted approximately six years. Its place was taken by the Authorora Circle. This was founded for both the young and the older people, but later on developed into a circle that left out the older folks entirely. It gradually died off between 1900 and 1905 and in its place the old Skillet Creek Club was revived.

One of the founders of this club was William Toole. Mr. Toole is a pioneer, having come to Wisconsin in 1859. His memory of the early organizations of the state and the county form interesting topics for discussion.

When organized the club consisted of some twenty members. The present membership is something over eighty and the meetings show a strong attendance each time. Meetings are held every two weeks during the winter and every month during the busy season of the year. At the head of the club are the president, the vice president, secretary and treasurer and a few advisory members, which control the programs and activities of the club. There is no set program arranged for months ahead, as timely topics are one of the chief aims of the club. The club interests itself in other matters besides social duties. Good roads, better field methods, home improvements and the hundred and one other topics essential to good farming come up in the regular turn for discussion at these meetings. Outside speakers are by common consent not very often invited, as it has been found that better results are obtained when local men give their experiences on questions of interest to the club. The large membership of the club and the regular meeting of so many people from one community has influenced the local papers to carry a report on the doings of the club, usually printed in connection with the program. These reports are read by non-members in the county who are no doubt stimulated towards greater interest in things vital to better farming through such reading. Thus the club activities have more than a local influence.

One of the features of the program is the visiting intermission, when the members are given an opportunity to talk to their heart's content to each other and men and women can exchange ideas of especial interest to their particular case. Refreshments are not the rule, though occasionally something light is served. The meetings are usually held at the home of some member who has invited the club. No regular order of meetings is followed.

One of the chief objects of the club has been accomplished in that it has tied the members together by a bond of friendship which, as someone aptly expressed it, "puts itself above the ordinary gossip of a community." Helpfulness and friendliness and sympathetic interest are three mighty weapons with which to overcome this worst trait of human nature. But the Skillet Creek Farmers' Club has in a large way brought this about by adhering strictly to these principles.

The growth and the lasting enthusiasm shown by the members of the Skillet Creek Farmers' Club has influenced other interests in the county to no small extent and Sauk county shows wonderful development in the club idea because of this.

SCENE AT A SUMMER MEETING OF THE SKILLET CREEK FARMERS' CLUB.

What a Live Farmers' Club Can Do.

To the Editor:—The principal subjects discussed during the past winter by the Inter-State Park Farmers' Club were farm buildings, farm management, farm credits and taxation. The only subject on which a consensus of opinion was expressed was the last named—all seemed to agree that the taxes are too high.

Our club has been organized five years now and during that time we have had under discussion every farm topic we could think of that would apply to farming in this locality.

When we first organized, the silo was a new thing up in this part of the state, so we took the subject up and worked it over pretty thoroughly. We got experts to come and give their experiences; in fact, we discussed every phase from construction to feeding the silage. This work did a great deal of good and hundreds of silos have been built.

We have held several short courses under the direction of the extension division of both Wisconsin and Minnesota. These have been far-reaching in effect. They not only have helped those who were able to attend but others have been helped indirectly. We once held a poultry short course with Mr. N. E. Chapman, of St. Paul, as director. This was an exceptionally enthusiastic meeting and I cannot begin to tell you the interest that was worked up in this line.

Another very interesting series was devoted to the study of soil fertility. We had two meetings a year for three years on this subject. Prof. A. R. Whitson and F. L. Musback, of Madison, were the principal speakers from away. This is a very important subject and we felt warranted in spending a lot of time on it. Everyone agrees that the time was very profitably spent. Considerable time was taken up with dairying and corn raising and also potato raising, as these are the principal industries of this locality.

We have been influential in starting several coöperative organizations, such as stock shipping and produce companies, and several farmers' clubs have been organized through the influence of our club. Just now we are interested in the Federation of Polk County Clubs. This was organized on the 20th of last January, its purpose being the betterment of rural welfare of the county.

We are expecting great things from this federation and we hope to make it a great influence for good. A great deal of interest is being taken, nearly all the clubs having joined, some twenty or more in all. We expect to hold at least two meetings a year, a winter meeting of two days and a picnic in the summer. This summer our picnic will be held June 16th at Deer Lake near the center of the county. We will have a short program and a good social time and we hope to get better acquainted. Next winter we plan to have an elaborate program and get down to serious business.

Polk Co., Wis. P. F. Amery.

Interested in Commercial Fertilizer.

Our club here at Pine River has, I believe, succeeded in arousing the young men and women also to take a greater interest in the most noble of all manual pursuits, farming. Interest has been created and maintained principally by the active part taken by the pupils of our state graded school. It is the rising generation, I believe, that should be educated and molded, not for war so much, but for work, real, physical farm work.

One phase of our club work the past winter has been the crying need of more intensive farming. A good interest was manifested at a lecture given on the value and proper use of commercial fertilizer. In this locality, I believe, there should be a liberal, but proper, use of some good commercial fertilizer to supplement the inadequate supply of our barnyard manure. To this end several experiments will be made during this spring and summer. H. P. Andersen.

Waushara Co., Wisconsin.

Card Parties Failed to Interest.

To the Editor:—I am very sorry to have to tell you that our club has done practically nothing, only met every two weeks and had current events and talked about and wondered if we really would have war. I will tell you there is too much opposition. If a few want one study, someone else is against it. We started in the fall to have card parties so the men could have a good time, but it seems as though some thought the men did not need a little pleasure and the parties were stopped. We have no photos of our club members, sorry to say, but if we did have, we would gladly lend them to you. I surely wish I could give you a better opinion of our club, but I am afraid I can't. I would gladly receive some good suggestions just what you think would be right for a country club. I think if all would work together the club might be a success. I wish you would please tell us what to do and what topics to take up so as to make our club an interest-

(Concluded on page 20.)

Wisconsin's Farm Labor Problem.

A Few Ideas From Well-Posted Badgers on How We May Help to Solve This Vexing Question of Farm Help.

Suggests Canvass of Available Labor.

To the Editor:—The farm help situation in this county is very serious and there will likely be a decrease in the potato acreage because of it. Because of this fact we have organized our county very effectively to meet the emergency problems that have arisen because of the war. We are now making a canvass of all the schools in the county to find out the available supply of farm labor. I think there will be considerable relief afforded by the labor that is in the schools at present.

In regard to suggestions as to how to use this school labor, and how it might be made both available and efficient, I wish to submit this plan. In Stevens Point there are a large number of young men in and above the eighth grade who have never had farm experience. I would suggest that a committee be appointed to confer with the principal of the schools and make an immediate canvass of all the available labor above fourteen years of age. The next step would be to appoint enough leaders from the business and professional men of the town, so that there could be a leader for every three or four boys. This leader could be assigned three or four boys. He could meet with them and their principal and also arrange to meet each boy privately with their parents. The object of a private conference would be to impress upon both the parents and the boy the importance of offering his services to the agricultural interests of a community at a fair price—"not war prices." It seems to me it will be necessary also to impress upon the prospective young farm hand the importance of staying by the job, and to make clear to him that it is a patriotic duty to carry out his contract in case it should be made. On the other hand, this leader could meet with prospective employers and impress upon them the fact that they, too, have a patriotic duty to discharge. Make them understand clearly that they cannot expect to get $35 worth of work out of a $20 or $30 boy. He should see that the farmer understands that he would be as much of a "slacker" to exploit the boy as would his hired man in case he gave up the job because there were disagreeable things to it.

I have been discussing this plan with the chairman of the County Defense Council and may write to you later if anything comes out of it.

J. M. Coyner,
Portage County Agricultural Agent.

Need "All-Year" Farm Hands.

To the Editor.—While farm help is very scarce and wages high, the farmers in our county who hire men throughout the season are pretty well supplied with help for the year. Many of the farmers, however, are obliged to put on extra help during the rush season, and there are others who only hire during the rush season. These farmers find it very hard to get help, as there are no men to be hired. It seems that every one is employed.

The men in La Crosse, through the efforts of the agricultural bureau of the Chamber of Commerce, have pledged themselves to assist the farmers of the county in harvesting their crops if laborers are scarce. More than 1,000 business men have signed their names to a petition, stating that they would go out and work at least one day in the fields assisting the farmers to harvest the crops. This has assured the farmers that they may plant large crops and still have the help to harvest them.

In summing up our labor situation, I would say that, while it is hard to get help, there is really no hardship put upon the farmer who can hire throughout the year. Transient labor is generally scarce. Probably this condition will, if carried to the extreme, cause the farmers to so adjust their farm management system that men can be employed throughout the year. If so, this will be of great help to the farmers and to the men who are obliged to work for the farmers.

T. H. Campion,
Principal La Crosse County Agricultural School.

Suggests Saloon Closing.

To the Editor:—Farm help, so far as I know it about the state, is going to be a scarce article. You ask for suggestions as to how the matter of farm help may be remedied. Here is one: In Wisconsin we have probably 8,000 saloons. It is safe to say that at least ten hours of time are consumed every day, at the very least, in each of these 8,000 saloons. That would make 80,000 hours of lost time, at the least, every day in Wisconsin. There are, in round numbers, thirty days to the month. We then have at least 2,000,000 hours of lost time a month on account of the saloons of Wisconsin, and I think that this is way too low. If the saloons of Wisconsin were closed during the next four or five months, this labor would probably be employed in some direction.

On top of this you can figure about one pool hall for each place of 500 people, which consumes an equal amount of time. It would help some, you see, if pool halls and saloons were closed, as places where slackers ordinarily hang 'round. But, then, this is too practical, and I presume you cannot use it. For my part, I am tired of this planning on using boys to do our farm work when men are consuming this tremendous amount of time at the saloons.

Yes, I think that it would be possible to get large interest among high school boys to do some sort of farm and garden work, but that is a matter which each community ought to realize upon under the direction of the State Council of Defense.

One thing we must be careful about and that is to have the emergency work going on so well organized in Wisconsin that we will not be consuming the time of the farmers in too many meetings. This is a thing which I very much fear some of our enthusiasts are planning on doing. So far as I am concerned, I have been going along my accustomed way, waiting for the State Council of Defense or some other duly constituted supervising body to tell me where to lay hold. We must be careful with the various agencies which are going to start out to do things that we do not become like a lot of bumblebees in a bottle.

E. L. Luther,
Supt. County Agents.

In Burnett County.

To the Editor:—Our farm labor problem in this county is not a serious one, because our farms are small and one-man size, and we seldom need extra help except in the fall. Several boys in our high school have expressed themselves as anxious to get work on farms.

Geo. Briggs,
County Agricultural Agent, Burnett county, Wis.

City People Should Volunteer.

To the Editor:—The farm labor problem is not serious in our county. There is a shortage, but the situation is not acute. I think the situation can properly be met in places by each city or village resident volunteering one day to go out into the country and help plant or harvest. Some central body could have charge of the work so that all labor would be properly distributed.

R. A. Kolb,
County Agricultural Agent, Taylor county, Wis.

Serious in Oneida County.

To the Editor:—Farm help is very serious in Oneida county, and so far we have been able to do very little to relieve the situation. A few young men are planning to go from school, but I fear this will not help very much.

W. D. Juday,
County Agricultural Agent, Oneida county, Wis.

Work of Wisconsin Breeders' Associations.

Rusk County Guernsey Breeders.

To the Editor:—As you know, we live in and are developing the youngest county in the state. Five years ago no apparent interest was taken in dairying and there were no organizations of any kind to promote this industry. What few cows there were in the county were native or imported scrubs and there were no pure-bred sires. We have more than sixty pure-bred Guernsey sires and more being purchased almost monthly. In fact, four of serviceable age were purchased a week ago. There are also a large number of pure-bred sires of other breeds throughout the county. One important fact that has been developed by the Guernsey and Holstein breeders' associations is the organization of a cow-testing association which will be organized this spring and conducted throughout the season. Farmers realize that this is the only means of testing out and grading up their herds. We all realize that we have cows which are not paying their way and we are determined to weed them out. We have a large creamery here and three cheese factories built within ten miles of us last year. Many of our farmers boast of a milk check for more than $200 a month during the spring and summer months.

Rusk county is a wonderful grass-producing region, corn ripens and the land produces abundant silage, clover and alfalfa. More than sixty silos were erected in the county last year, and land that sold a few years ago for $10 and $15 an acre, when developed, is now readily sold for $100 per acre and more.

At our last meeting held in February, the former officers of the association were re-elected and every one is taking hold with enthusiasm. Within the past two weeks we have been asked to furnish two carloads of grade Guernseys to the development agent of a railroad company in North Carolina and the university of the state of Iowa also desires to purchase a carload of Guernsey calves between the age of six and twelve months. The association, however, discourages these sales at this time, as we need all the stock we have to develop our own dairy interests at home.

L. E. McGill.

Jersey Breeders in Dunn County.

To the Editor:—I wish to report that the members of the Dunn County Jersey Breeders' Association are all doing fine. I have had occasion to visit most of them in the last few days. We have not had any official meeting of the association this winter, but there have been some interesting individual discussions and proposed changes and enlargement of our asso- the state.

H. L. Tuttle, Sec.

Organize Cow-Testing Association.

To the Editor:—I wish to report that we have organized a cow-testing association operated under the direction of the Waukesha County Guernsey Breeders' Association. We now have twenty-six breeders who are having their herds tested monthly. The annual summer meeting of the association will be held the day previous to our sale, which will be June 6th, the sale to be held on the 7th. Our summer meeting this year is to be held jointly with the annual summer meeting of the Western Guernsey Breeders' Association at the Geo. McKerrow & Sons farm, Pewaukee, Wisconsin. The present officers of our association are: Geo. Lawson, Oconomowoc, president; Earl Roberts, Waukesha, vice president; F. E. Fox, Waukesha, secretary and treasurer.

F. E. Fox.

Breeders Form Union.

To the Editor:—There are a few of us Jersey breeders here in St. Croix county and we are doing our best to have the Jersey cow secure the recognition which she deserves. We have joined forces with the Washington county, Minnesota, Jersey men and formed a good, strong organization with L. W. Ash, Roberts, Wisconsin, president. Everyone in this neighborhood reports active inquiries for stock and with the present high prices of feed a good many of our people are beginning to discover that they have cows which are not paying for what they eat. I believe in most of our testing associations in this neighborhood the Jerseys have produced butter fat cheaper than any other breed.

W. C. Bradley.

Manitowoc Guernsey Breeders.

To the Editor:—The Manitowoc County Guernsey Breeders' Association held their fifth annual meeting at the court house at Manitowoc on the 17th of February.

In the forenoon Mr. Gavin McKerrow gave a very interesting talk on feeding and caring for the Guernsey cow to make large records. He also gave the breeders pointers about pedigrees when they were going to buy herd sires, not to buy just because there was one large record on the pedigree, but to see to it that there are fairly good records all through the pedigree.

He also encouraged the breeders of Manitowoc county, saying they had some very good Guernseys. In the afternoon several of the leading business men of Manitowoc spoke to the members and said they were willing to help the association wherever they could. It was decided to give a silver cup to the Guernsey breeder that wins the most prizes on Guernseys at the Manitowoc County Fair next fall.

It was also decided to raise the membership fees to $2 a year instead of $1. The following officers were elected: President, Fred Jacobs, Jr.; vice president, John A. Pritzl; secretary, George W. Kiel; treasurer, Otis Merken; directors, August Ahrens, Henry Kolb.

The association has thirty paid-up members and more coming in.

The summer meeting will be held on the Otto Rognes farm some time in June.

George W. Kiel, Sec.

Sheep Respond To Good Care.

By Ed Nordman, Chairman Agricultural Committee, Wisconsin State Council of Defense.

WHILE sheep require very little work and attention as compared with other lines of live stock, that little they must have with regularity and precision, otherwise the business is sure to be a failure. Sheep respond to good feed and careful treatment more readily, I think, than any other animal on the farm, but, on the other hand, they are the first to get out of condition and become unprofitable if they are neglected. This matter of care and feed is really of the greatest importance, for it is money thrown away to invest in fine breeding stock unless one has the facilities and the disposition to keep that stock in a thriving condition. I speak of this because there are many people who seem to have a notion that to succeed in the sheep business all that is necessary is to get a flock of registered ewes to begin with. My advice to beginners would be to look first to their facilities for caring for sheep. These being in a satisfactory condition, they should then get the very best foundation flock that can be afforded, and, in addition to this, the kind of pure-bred ram should be kept that conforms most nearly to the type of sheep which in the locality are likely to be the most profitable.

New Super-Six Speedster

Latest, Fastest Hudson Model. A smart car with new lines. Seats four. $1750 at Detroit.

The newest Hudson Super-Six model is a four passenger Speedster.

It is the smartest Speedster you have ever seen. In the grace of its lines, the dashing beauty of its finish and its wonderful performance it expresses the "spirit of youth."

The allotment of these cars to dealers is not large. Even before our dealers were told anything of its details, even without advertising or announcement of any kind, customers placed orders to assure early delivery.

To get an idea of the probable demand for such a car dealers asked some of our Super-Six owners about it. The result is shown in the orders they gave. No description of the Speedster, not even an idea of what it would look like, nor even assurance definite delivery dates. Still the orders continued to increase, and a repetition of last year's condition when buyers grew disappointed at not getting delivery of their Super-Six when wanted caused many dealers to stop accepting orders.

And why shouldn't there be such a demand for a Hudson Super-Six Speedster? Everyone knows of the official record of a stock Super-Six chassis in traveling a measured mile at the rate of 102 1-2 miles an hour. And all motorists are familiar with other wonderful performances of the Hudson Super-Six. The Super-Six has proved it has just the qualities you would require in a Speedster.

There could be no concern about the beauty or grace or finish of the body. The artists responsible for such lines as are revealed in the Super-Six Phaeton, the grace of the Hudson Super-Six Limousine, and the daintiness of the Town Car, could be relied upon to design the smartest Speedster.

Such a car awaits you. You must acknowledge its low sweeping lines, its rich Cobalt Blue body with English Vermilion wheels, the smartest Speedster you have ever seen.

Don't forget that the allotment is small, that the factory is not building many cars of its type, and that only a few cars are available to any one dealer. Some will probably not be able to get any at all.

Phaeton, 7-passenger $1650	Speedster, 4-pass. $1750	Town Car Landaulet $3025
Cabriolet, 3-passenger 1950	Town Car . . 2925	Limousine . . . 2925
Touring Sedan . 2175	(Prices f. o. b. Detroit)	Limousine Landaulet 3025

HUDSON MOTOR CAR CO., DETROIT, MICH.

In and Around Wisconsin

NINETEEN farmers in the vicinity of Neenah, Winnebago county, have completed the organization of a cow-testing association. Chriz Meltz was elected president and E. J. Jorgenson secretary and treasurer. The organization will be put into working order as soon as possible and a competent tester will be hired.

L. A. MARKHAM has been appointed county agricultural representative for Rock county. Mr. Markham has been identified with rural Y. M. C. A. work in Rock county. He is familiar with all of the agricultural organizations in the county and should be a splendid man for the position to which he has been chosen.

STOCKHOLDERS of the New Richmond Packing Company, who live in the vicinity of Rusk, held a meeting in that town recently to strengthen their organization. Officers were elected as follows: James Braker, president; Mike Bridgeman, secretary; Bert Wing, treasurer, and Ed Rosseter, buyer. Thursday was selected as the shipping day.

THE Wisconsin Live Stock Breeders' Association is responsible for the following statement: "On the basis of an eight-hour day every day of the year the total production in dairy and live stock lines was summarized as follows: Production every minute—butter, 756 pounds; cheese, 1,349 pounds; condensed milk, 2,264 pounds; meat, 5,557 pounds. The meat listd includes everything except poultry—veal, pork, beef, mutton. Poultry statistics show 56,000,000 dozen eggs a year and 9,000,000 chickens raised in Wisconsin."

A WORTHY effort to relieve the present scarcity of foodstuffs is being made by the Marathon County School of Agriculture in the organization of home gardening and canning clubs. Tomato clubs are especially popular. Any group of six or more girls between the ages of ten and eighteen years may start a club. When the tomatoes are ripe a canning outfit is sent to each club and an instructor shows the girls how to put up the product. Corn clubs also have been formed and are receiving help and encouragement from the local schools and the federal department of agriculture.

WITH the appointment of Leon H. Robbins as agricultural representative for Jackson county, approved by the board of supervisors, a total of twenty-two Wisconsin counties are now supplied with these public service agents. Mr. Robbins will begin activities at once with a tour of the farming districts to note conditions of labor and acreage in relation to food production. The Jackson county representative is well fitted for the position he assumes. He is a graduate of the Minnesota College of Agriculture, a former county agent in North Dakota, and has had much experience in practical farming. He has also taught agriculture in high schools.

DURING the months of January, February and March there were 65,000 licenses issued by the state of Wisconsin for motor vehicles. This is an increase of 14,560 or about 30 per cent over the corresponding period of the year, 1916. If this ration of increase should continue throughout the year Wisconsin will register 165,000 or 170,000 cars for 1917. There are about 695,000 horses in Wisconsin and it now appears that by the end of 1917 there will be one automobile for every four horses in the state. We do not have the accurate report for registrations of automobiles for April, but there is said to be about 30,000, which is maintaining the increase over 1916 in about the same ratio as the three previous months.

AT a recent session of the Kewanee Buttermakers', Cheesemakers and Dairymen's Association a large number of questions were asked and answered. The following will be of interest:

Q. How much silage should a dairy cow receive daily?

A. Thirty to forty pounds.

Q. How do you determine the value of a dairy cow?

A. By the amount of butter fat she produces in a year.

Q. What is the cheapest disinfectant for barns known and has it any other value on the farm other than as a disinfectant?

A. Lime; it sweetens the soil.

Q. What is the proper method for cooling milk?

A. Cool at 50 degrees F. immediately after milking.

Q. How often should milk be stirred in the can in the course of cooling?

A. Stir until thoroughly cooled.

Q. Does the feeding of silage affect the quality of cheese?

A. No.

Q. What should be done with a cow that gives twelve quarts of milk to a milking?

A. Should be milked three times a day and properly fed.

Q. Are the milking machines coming up to expectation?

A. Yes.

Q. How often per day should a dairy cow be watered?

A. She should have water any time she wants it.

Q. Now that whey butter is being manufactured, is the whey as valuable for hog food?

A. Yes, when the whey is not diluted with water.

Q. In our anxiety to get more pasturage, how many of us spare a few shade trees to get shady spots for our stock?

A. Sixty per cent.

WINNEBAGO county has engaged Reid F. Murray as county emergency food agent. Supervisors in each township of the county will act as local leaders and coöperate with Mr. Murray in his work. This special campaign is carried on under the direction of the Winnebago County Defense Council, a branch of the Wisconsin State Council of Defense. Mr. Murray expects to assist in distributing farm labor. He advises the saving of heifer calves instead of selling them for veal. Eleven other counties of Wisconsin are considering the employment of an emergency food agent.

POSTERS are in evidence throughout Wisconsin, urging farmers to do their bit for the country by striving to produce the largest crops possible. "Food production is farm patriotism," is the leading phrase of the posters, which were prepared by Dean H. L. Russell, of the agricultural college. The suggestion is made that as much land be put in cereals as possible and that the acreage of tobacco be cut down in districts favorable to corn growing. In addition it is urged that land owners coöperate with tenants as much as possible and that retired farmers help out on the farm wherever it is practical.

THE firm of Libby, McNeill & Libby, owning and operating a condense plant at Juneau, has taken up with its patrons the proposition of plowing land at cost. As we understand the company's proposition, it proposes to buy several tractors and put them in the fields and charge the farmers only the cost of operation and labor. The ultimate aim is to increase milk production, which, of course, can be best accomplished by raising the best feed. The company recommends that each patron put in a few acres of sweet corn, oats and field peas. In case of shortage of seed the condense company will furnish the seed at cost. In a statement issued the Libby, McNeill & Libby Company say that they can use all of the good, sweet milk they can get and that they are very willing to pay good prices.

MR. WM. TOOLE, of Sauk county, writes that there is considerable interest in harnessing up the Wisconsin river power and delivering it through the rural districts in the form of electricity. The cost of poles, wires, transformers, etc., for carrying current through the rural districts averages about $400 per mile and the labor for putting all in order for business is approximately $150 per mile. The expense must be divided among the patrons within a given distance, hence the thickly settled townships will be able to get the current cheaper per individual than those more sparsely settled. The usual average is about four persons to the mile, and at a cost of $550 per mile for installation this puts the cost per individual farm at about $135. The farmers organize their own companies to handle the current and it requires about twenty users for each company. A map of the proposed district to be served must be submitted to the state commission and all persons residing within the territory must be served if they desire, whether they wish to become share holders in the company or not. Under the state law all persons renting current from the local company must be on an equal basis so far as rates are concerned.

Speed Up the Haying

WHEN the mower has once started its work, every hour of good haying weather is precious. That is why it is good business to use **International Harvester** hay tools, which, in good curing weather, will put the hay under cover, well cured and in prime condition, **in four to five hours after cutting.**

With an **International, Keystone,** or **Osborne** left-hand side-delivery steel rake you can follow closely after the mower, piling up two swaths at a time on the raked stubble, into a light fluffy windrow that allows free circulation of air through the hay, curing it completely and quickly.

Now the hay is ready for the barn. The final step in speeding up is made with an **International, Keystone,** or **Osborne** mechanical loader—the quick, easy way to rake the field clean without threshing leaves and blossoms off the hay. These loaders are made in types and sizes for all different haying conditions, and can be obtained from local dealers.

We will gladly send full descriptions of any of these good **International Harvester** hay tools on request. The lines include side-delivery rakes, loaders, tedders, sweep rakes, stackers, and combined sweep rakes and stackers.

UPPER WISCONSIN

TO the Editor:—Clearing land on light soils in Bayfield county has cost me about $30 per acre and on heavy soil where timber has been thick and large it will cost about $50 per acre. I have used chiefly dynamite in this neighborhood because of the fact that it seems easier to get the stumps together in piles and burn them. Dynamite is a little more expensive, but in my particular case it has proven to be cheapest when I consider the cost of piling and burning.

Alfred Johnson, Bayfield county, Wis.

SOME practical work is being done in Langlade county, where arrangements were made two weeks ago for the purchase of 1,000 bushels of spring wheat for seed. This wheat was bought from a Minneapolis concern and shipped to Antigo, where it was distributed through one of the local seed merchants and the county agricultural agent, F. G. Swoboda. The seed was sold at cost plus freight charges and a few cents incidental expense for handling. Some idea of the interest taken in this matter may be gathered from the fact that each bank in the county and each newspaper office assisted in collecting the requests for seed and turning them in to the county agricultural agent.

SETTLERS on the vast empire of cut-over lands in Upper Wisconsin are rallying to the call of the nation to increase the food supply. Farmers in more thickly-settled regions will go in for a maximum production of silage and crib corn, according to a statement of E. J. Delwiche, superintendent of the northern branch experiment stations of the Wisconsin Agricultural College, and in addition they will plant a good acreage of buckwheat, navy beans, oats, soy beans, barley and tested varieties of spring wheat. It is also expected that they will produce a supply of forage to keep a normal number of live tsock, including dairy cows. The new settler who has only a few acres fit for the plow and just a few head of live stock will have a more difficult problem, according to Mr. Delwiche, but his first step will be to plant a good vegetable garden and produce on it as much of his home food supply as possible. Many of the settlers on sandy or loamy soils will plant potatoes, but on the heavier soils, where potatoes will not do very well, such crops as cabbage, rutabagas and turnips will receive first consideration. For the present season experiments in new crops have been discontinued in Upper Wisconsin and all land and labor will be used to the utmost to produce a maximum yield of staple crops.

TO the Editor:—Potatoes are commonly grown in this state on farms where hay crops, corn and root crops are produced in abundance. As a rule, either dairying or some other form of the live stock industry is practiced on these farms as well. Potatoes should not be raised on the same land more frequently than one year in three and in some cases, one year in four is preferable. On the farm system mentioned, this rotation is easily provided. Under these systems of farming high-grade feeds are supplied to the live stock, thus making valuable manure available for soil fertility. This source of fertility is one of the foundations for success in commercial potato growing.

Many sucessful growers on the better kinds of soil, plow under the second crop of clover in the fall. In addition an application of stable manure is made before plowing. With this plan the clover sod and stable manure partly decompose during the winter and in the spring this sod can be thoroughly pulverized and fitted by the use of disks and harrows just previous to planting.

On the light, sandy soils of Wisconsin many growers prefer to postpone plowing and fitting the land until the approach of the potato planting season. In some cases a good growth of clover has started at this time, and to this stable manure is applied in a comparatively fresh condition. Intensive fitting is given the soil immediately before planting. Thorough ventilation and a good seed bed are essential to better crop of potatoes.

Both of these methods have proved successful in Wisconsin; and the application of manure varies as to time in the same manner. In any event, practical growers find that the intensive fitting of the land just before planting is more important than the sole question of fall or spring plowing.

J. G. Milward, Madison, Wis.

UPPER WISCONSIN people will be glad to know that the legislature has passed a measure empowering the state department of agriculture to buy dynamite and sell it to farmers of the state, for agricultural purposes, at cost.

D. J. JUDAY, county agricultural agent for Oneida county, makes the following statement as to what Oneida county farmers may do to prove their patriotism:

1. Grow as large an acreage as you can well tend of potatoes, carrots, rutabagas, navy beans and buckwheat. Grow a small plot of spring wheat and barley.
2. Sow no seed unless it has been tested for germination and purity.
3. Treat all grain and seed potatoes. If not familiar with the process inquire of your agricultural representative. Treating materially increases yields.
4. Prepare the seed bed well and cultivate more thoroughly than ever before.
5. Preserve a large supply of vegetables and fruits by drying, storing or canning.
6. Spray your potatoes at the right time, both with a poison spray and Bordeaux mixture.
7. Utilize all available farm manure and where there is not sufficient, procure commercial fertilizer.
8. People in cities and villages should raise all their own vegetables. Every vacant lot should be made to produce some food product.

TO the Editor:—Some idea of the demand for pure-bred northern-grown Wisconsin seed corn can be gathered from a letter received a few days ago by the Marinette County Agricultural School from C. A. Correll, a settler, of Marinette county, who was formerly an Indiana farmer. Mr. Correll and his son took first and second prizes in the state-wide grain show at Madison during the winter, on Wisconsin No. 25 corn, and, as Mr. Correll states in the accompanying letter, he could have sold a great deal more seed. Mr. Correll has been specializing in producing Wisconsin No. 25 corn seed ever since he located in Marinette county, and each year he has been able to receive prices way above the market because of the excellence of the seed he had to sell. The customers he secured the first year, are his customers every year now. Mr. Correll's letter follows: "I wish you would please ship me the bushel of seed corn I left at the training school last fall. I sold the last of my 200 bushels of seed March 1st, and since that time have had to return over $200 worth of checks and drafts—and still they are coming in every mail. I think I could have sold 1,000 bushels easily."

Howard I Wood.

Marinette county, Wis.

CURRENT EVENTS

THE British and French delegations, sent to this country to coöperate and confer on war matters, reached Washington last week, and daily meetings are being held with the president, members of his cabinet and high army and navy officials. The French delegation includes the famous commander, General Joffre, looked upon as France's savior, because of the manner in which he checked the rapid German advance on Paris in the early stages of the war. General Joffre is known to be heartily in favor of the United States sending troops to France. He believes that the moral effect of the stars and stripes participating in the actual fighting would be highly effective in the struggle against German militarism. His idea of an American expedition calls for a fighting force supported by auxiliary services, such as railway staffs, railway materials, base repair shops, telegraph and telephone lines, automobile transport and a strong aviation section. The French government is ready to offer whatever may be considered necessary to assist in sea operations, including the use for naval purposes of any or all ports in France. The ministry of marine has worked out for submission to the American government a comprehensive plan for overseas transports, for both army and navy purposes and for the provisioning of the civil population. While General Joffre is thus pleading for fighting men, Arthur J. Balfour, former premier, head of the British delegation, is pleading more for munitions and money than for men. He is laying stress upon these prime necessities: Shipping, food and other supplies, money and naval and military coöperation. The British and French delegations will remain here indefinitely, as long as they can render aid or be of any service in placing the United States on a military basis.

FOREIGN MINISTER BALFOUR, who heads the British delegation to the United States, denies most emphatically that it is the intention or desire of either the British or French delegations to secure a treaty from the United States pledging itself not to conclude a separate peace with Germany until the war has been fought to the end. Denying reports to this effect, Minister Balfour said: "I am told that there are some doubting critics who seem to think that the object of the mission of France and Great Britain to this country is to inveigle the United States out of its traditional policy and to entangle it in formal alliance, secret or public, with European powers. I cannot imagine any rumor with less foundation, nor can I imagine a policy so utterly unnecessary. Our confidence in this assistance which we are going to get from this community is not based upon such shallow considerations as those which arise out of formal treaties. No treaty could increase the undoubted confidence with which we look to the United States, who, having come into the war, are going to see the war through. If there is any certainty in human affairs, that is certain." Practically all of the anti-German allies have signed a pledge not to conclude a separate peace, but such a pledge will not be required of the United States, according to Mr. Balfour.

BOTH houses of congress have passed the bill providing for raising $7,000,000,000, by bond issuance, for a war fund, and President Wilson has signed the measure. The bonds will be issued as soon as the necessary printing and clerical work can be attended to. They will probably draw 3½ per cent interest. Already it is quite apparent that they will be taken up promptly by the general public, for advance subscriptions already total a large sum. A good part of this fabulous fortune will be loaned to the British and French governments to carry on the war. Without waiting for the bond issuance, the United States last week completed arrangements to loan England $200,000,000 at once, the money to be available out of the proceeds of the $250,000,000 worth of treasury certificates of indebtedness due June 30th. France's needs are placed at $100,000,000 a month practically as long as the war continues and England will ask for a large share of the big American fund, for while it is obtaining money at home for its war purposes the interest rates have risen there to a higher figure than they have in this country. President Wilson has asked Elihu Root, United States senator from New York and former secretary of state, to head a delegation to visit Russia to see what the financial needs of that country are. The United States will finance all the nations fighting Germany, so far as possible, that being the best and quickest manner in which it can render aid for the present, at least.

THE terrific drive of the British and French against the Germans along the western battle line in France continues, with repeated gains for the foes of the Teutons. The victory is being won at a heavy cost of human life, the Germans losing particularly heavily, according to the press reports. It is rumored that Von Hindenburg is withdrawing men from this line to send into Russia, where conditions are unsettled and uncertain, and that this is one of the chief causes of the allies' gains. The allies appear to have the advantage, however, in munitions as well as men and the German lines are being bombarded in a most terrific manner, prior to all the infantry charges. There has been much hand-to-hand fighting during the past week, the advantage seeming to be with the British and French. There is still much territory to be won back, however, before the Germans are pushed out of that portion of northern France which they won in their rapid drive toward Paris at the beginning of the war.

THEODORE ROOSEVELT advocates immediate steps to limit the amount of grain for brewing and distilling intoxicating liquors. He advocates also that the use of automobiles for joy-riding be stopped so that the nation's supply of gasoline can be conserved for war purposes, and that the government, in case of food shortage, mobilize and conscript men for tilling the soil. Several hundred farmers and estate owners cheered his address in which he declared for these things. "When we are threatened with a shortage of foodstuffs, as is apparent in the country-wide crop reports today and when it is our duty to supply food to our allies to our utmost ability, we should see that needed grain food necessities are not diverted from their proper usage to the manufacture of intoxicants. Most of the belligerent nations in Europe have taken steps to settle this problem. There are many other sides of this economy question. Joy-riding should be stopped. It is a waste of gasoline and we are going to need more gasoline than ever before in our war activities."

THE wave of war economy has hit the railroads and their transportation experts are figuring on how to reduce the number of passenger trains to the lowest possible number. Passenger service is considered by many of the railroads as more or less of an advertising luxury. They figure that by cutting out a part of their trains the traveler, while losing his present pleasure of "a train at any hour," the roads would have the satisfaction of filling every seat in the coaches and have two fares from seats which now carry only one. To many points, such as St. Paul, Kansas City and St. Louis, competing roads run trains starting on almost identical minutes and arriving on the same time. It is figured that by concerted action many of these trains can be eliminated and the remaining ones will still be able to care for the traffic. The government is desirous that some such action be taken, as it expects to be called on to move large numbers of men on a moment's notice and will need all the rolling stock available, it was said at the office of R. H. Aishton, president of the Chicago and Northwestern railway and one of President Wilson's national defense council.

THE first and most important duty of the American people to their allies is to economize on foodstuffs. This is the appeal of Herbert C. Hoover, chairman of the American committee for relief in Belgium, and recently appointed head of the American food board. "If we do not do it," he declares, "we stand a grave chance of losing the war, because our allies cannot fight without food. Our enemies are calculating that America will fail in this and our allies will need to give in. America can upset these calculations." Mr. Hoover's observations were made after three weeks of consultation with members of the British, French and Italian cabinets. He also investigated the food and shipping situation and plans for American coöperation. The net result he arrived at was that between now and the next harvest it would require a supreme effort by the American people. "I feel it my duty to emphasize," Mr. Hoover says, "that the food situation is one of the utmost gravity which unless it is solved may possibly result in the collapse of everything we hold dear in civilization."

$1150 F. o. b. Racine

Mitchell Junior—a 40-h. p. Six
120-inch Wheelbase
Price will be advanced to $1195 on May 10th

Mitchell SIXES

$1460 F. o. b. Racine

7-Passenger—48 Horsepower
127-inch Wheelbase

Why Other Cars
Omit These Mitchell Extras

The Mitchell offers you
31 extra features—
24 per cent added luxury—
100 per cent over-strength.

When you see these extras—each a wanted feature—you will ask why others don't include them. This is to tell you the reason.

Cost $4,000,000

The Mitchell extras, on this year's output, will cost us $4,000,000. To add them to the ordinary car would bring the price too high.

In the Mitchell plant, we save them in factory cost. John W. Bate, the great efficiency expert, has worked for years to do that.

This entire 45-acre plant was built and equipped by him. And every detail is designed to build this one type economically.

He has cut our factory cost in two. No other plant could build a car like the Mitchell at anywhere near our cost. And that saving goes into these extras.

A Lifetime Car 100% Over-Strength

The 31 extra features—like a power tire pump—will seem a great attraction. The added luxury—24 per cent—makes the Mitchell the beauty car of its class.

But our greatest extra is the double strength in each important part. In the past three years we have doubled our margins of safety.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly-developed 48-horsepower motor.
Price $1460, f. o. b. Racine.

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase and a 40-horsepower motor—¼-inch smaller bore.
Price $1150, f. o. b. Racine.

Also six styles of enclosed and convertible bodies. Also new Club Roadster.
Price will be advanced to $1195 on May 10th

Over 440 parts are built of toughened steel. All safety parts are vastly oversize. We use a wealth of Chrome-Vanadium steel. We use Bate cantilever springs, which never yet have broken.

We have proved that Mitchells can run 200,000 miles. Few owners will live to wear a Mitchell out.

Our $1150 Six

Now there are two sizes—Mitchell and Mitchell Junior. But even the smaller has a 120-inch wheelbase. Both sizes offer you values far beyond similar cars.

See these new models. See all the extras they embody. You will want such a car as the Mitchell when you buy a car to keep.

If you don't know the nearest dealer, ask us for his name.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

Substitutes Corn for Tobacco.

Dane County Farmer Says That, Everything Considered, Corn in the Long Run is the More Profitable Crop to Raise.

AFTER four years of close observation and careful comparison H. C. Taylor, of Dane county, Wisconsin, has decided to eliminate tobacco from his farming operations this year. He will use the land and energy formerly devoted to growing this crop toward increasing his supply of corn silage and grain for the feeding of additional dairy cattle.

Mr. Taylor is qualified to study the situation, as he has been for many years professor of agricultural economics at the agricultural college at Madison. His farming, however, is not of the book variety, as Mr. Taylor was born and raised on an Iowa farm.

According to Mr. Taylor, corn and tobacco are competing crops with a dairy farmer and corn should have first consideration. He figures corn in terms of corn silage and milk and corn and hogs and on that basis corn is the more profitable. The reasons which he sets forth in favor of corn at this time when conditions seem most favorable for the tobacco growers are worth considering. Mr. Taylor has had four years of good crops and comparatively high prices. In 1913, which was a banner year for tobacco growers, he received $600 for his share of a ten-acre field. In 1914 the price for tobacco was 8.5 cents per pound. In 1915 the price dropped to 5.5 cents per pound, but in 1916 it again raised to 10 cents per pound. During the same time corn has increased in value from 50 cents per bushel to more than $1. This is practically doubling its value. Mr. Taylor figures that 25 per cent increase over the 1916 price for tobacco is all that can be expected. Hence the decision to grow corn.

Mr. Taylor bought his first seventy-five acres in 1912 and started in a small way to build up a dairy herd of Brown Swiss cattle. He has since added eighty more acres to his farm and increased his herd to fifty-five head, mostly Brown Swiss. In bringing together his herd he purchased from the leading breeders the heifers out of high-producing dams. Some of the finest families of the Brown Swiss breed are represented in the herd, Esther's Cincey, Lady Bell, Esther North and Bell Dinsom. One of his Brown Swiss cows produced in one year 11,111 pounds of milk, testing 5 per cent, and others are approaching this very closely. Some of the grade stuff still in the herd is also doing very well. The total output of milk amounts to approximately 200,000 pounds each year. The milk is sold on the pound basis at wholesale prices for restaurant and hotel use. The grade steers also bring a nice profit when fattened and sold over the scales.

It is the opinion of Mr. Taylor that corn and tobacco cannot be successfully grown on the same farm under ordinary conditions. The majority of the tobacco in Wisconsin is, however, grown in connection with dairy farming. Growing both corn and tobacco, according to Mr. Taylor, will result in one or the other crop being neglected. The cultivation of corn comes at the same time when the main energy of the farmer must be applied in the tobacco field. The constant efforts necessary on the part of a grower in combating the root rot disease in tobacco also require much time, attention and planning. Root rot disease decreases the yield and quality of the finer grades of tobacco very often to such an extent that coarser grades or "resistant" types must be grown in order to get a crop at all. Tobacco also does not fit in the rotation of the dairy farmer because only certain crops will yield well on the land. Because of the high state of fertility tobacco lands are usually kept in, grain will lodge badly when planted on these fields. Leguminous crops are also subject to the root rot disease and they are, therefore, not adapted to these soils. Corn will do well following tobacco.

Man labor and horse power at work on a cornfield will produce more than on a tobacco field, according to Mr. Taylor. It requires more men to till the acre of tobacco than of corn. Man labor can only be employed for tobacco for a little better than six months each year, while corn and cows will give work and yield results the year round. Corn is not subject to fluctuating prices as tobacco is, because silage will always produce milk and grow animals that are in demand. The fourth silo will be put up this summer and this will give the farm a silage capacity of 500 tons.

Mr. Taylor figures that if Wisconsin's 400,000 acres annually devoted to tobacco were to grow corn in 1917 a gain of 2,000,000 bushels in the yield of this crop would be possible. Figuring further the additional labor set free to work on cornfields a gain of 10,000,000 bushels in the state's production could be expected.

The usual conditions during 1917 will no doubt have a great effect upon the demand for foodstuffs next fall and winter and farmers of the tobacco regions of the state will do well to ponder over the points brought out in favor of corn by Mr. Taylor.

H. C. TAYLOR, DANE COUNTY, BELIEVES THE DAIRY BARN, MILK HOUSE, DAIRY COWS AND CORN PAY BETTER THAN TOBACCO AND THE TOBACCO SHEDS.

CORN AND COWS, ACCORDING TO H. C. TAYLOR, BEAT TOBACCO FARMING.

READY FOR HARVEST ON THE H. C. TAYLOR FARM.

Expand the Corn Acreage.

Corn is the leading food and feed crop of the United States in geographic range of production, acreage and quantity of product. The vital importance of a large acreage of this crop properly cared for, therefore, is obvious. Because of the prices obtained for the last crop and the world demand for this grain, its profitableness to the American farmer during the approaching season is clear. The 105,954,000 acres planted to corn in 1916 yielded 2,583,000,000 bushels or more than 400,000,000 bushels less than the large crop of 1915—2,994,793,000 bushels—and considerably less than the five-year average—2,732,457,000 bushels. Conditions now warrant the planting of the largest acreage of this crop which it is possible to handle effectively.

Law Questions.

Taxes In Two States.

A Subscriber, Pierz, Minn.—I lived in Iowa in 1915 and until March 1, 1916, when I moved to Minnesota. My personal property was assessed in Iowa, in January, 1916, for the taxes of that year, and after I moved to Minnesota, it was assessed there for the same year. Will I have to pay taxes in both states?

Answer.—The time for the assessment for taxation of personal property in Minnesota is the first day of May in each year; therefore, you will have to pay taxes in both states.

Detectives.

A Subscriber, Ashland, Wis.—How can I become a detective by law in Wisconsin?

Answer.—The law of Wisconsin does not provide for the appointment of detectives. District attorneys sometimes have occasion to use the services of detectives. You might apply to the district attorney for such employment.

No Such Law About Threshers.

A Subscriber, Vassar, Mich.—I am a member of a threshing machine company in Michigan, and the stockholders recently held a meeting at which the following question was discussed, viz.: Is there any law in Michigan which compels our company to thresh a farmer's grain when we are passing his place with our machine, and thresh grain for other farmers in his neighborhood?

Answer.—There is no such law in Michigan.

Save the Thresh Bill From the Stack

"We easily saved our thresh bills by using the Red River Special," says E. L. Hall and 14 other farmers near Densmore, Kansas. Here's the thresher that's *different*. It *beats out* the grain—gets it by force. Built for *fast work* too. Saves the thresherman's time—crowds more bushels into the day's work and more pleased customers into the season's run. Write and learn why the big money makers use the

Red River Special

It Saves the Farmer's Thresh Bill

If you own a tractor, hook it to Junior Red River Special and clean up an extra income this fall. Thresh your own grain and your neighbors' too. Our "Junior" is the ideal thresher for working with a tractor or gasoline engine. It is a younger brother to the Red River Special. Small enough to make home threshing pay—big enough to make money in custom work.

Has every needed feature of the big Red River Special—famous "Man Behind the Gun"—shakers, large sieves, etc. Write for circulars.

Spring Work Well Advanced.

Most of Oat Crop Is Seeded—Corn Plowing Has Commenced—Meadows and Pastures are Starting—Live Stock Healthy But Thin in Flesh.

WISCONSIN.

Barron County.—The weather continues cool and recent rains have delayed seeding. Clover looks fairly well. The acreage of wheat is small. Considerable spring wheat would be sown if the seed could be secured. Wheat and potatoes are scarce. About the usual acreage of barley and oats will be put in and a large acreage of corn for silage. Farm labor is scarce and wages are high.—S. J. Shannon.

Barron County.—Spring is very backward and little seeding has been done so far. More spring wheat will be sown than usual. There has been a big demand for barley seed. Stock came through the winter in good shape. Many farmers are short of hay and grain because of the long winter. There are not very many brood sows this spring and stock hogs have been sold off very closely. Young pigs from four to six weeks old are selling at $5.00 apiece. There is a big demand for dairy cattle of all kinds, but horses do not seem to be selling very high.—William Bartlett.

Bayfield County. — Wheat came through the winter in good shape. Clover was not damaged to any great extent because of the large amount of snow which protected it during the winter. The dairy industry is in good shape in this county.—W. R. Moore.

Buffalo County.—The outlook is favorable for good crops of rye, clover and alfalfa. Clover and alfalfa especially have come through the winter in fine shape. Cows are doing well considering the shortage of feed that is prevalent throughout the county. Hogs are in good condition, but are fewer in numbers than last spring. Many farmers sold their hogs off very closely because of the scarcity of feed. Oat seeding is well under way and soil works up in fine shape.—James G. Bates.

Chippewa County.—Most of the wheat has been seeded and about three-fourths of the other small grains. Pastures look fairly well for this time of the year. Young pigs are doing well but there are very few of them. Live stock show the effects of the long severe winter. Horses are doing fairly well. Poultry are in good shape. Rye and clover came through the winter without winterkilling and now look fine.—James A. Smith.

Crawford County.—The winter was very severe, but heavy snows protected the grain. Rye, wheat and alfalfa came through the winter in fine shape. Clover it not quite so good, but the condition of the wheat crop is above last year's average. Most of the farmers are sowing spring wheat. Nearly all of the oats and barley has been seeded and the early potatoes are nearly all planted. The acreage of potatoes will be larger this year than ast. Stocker and feeder cattle will be scarce. If the present price for stockers continues, pastures will not be crowded this season.—George Ashbacher.

Dodge County.—Cold weather is keeping vegetation back. Many farmers are now through with their spring seeding, but some have not yet begun. Winter wheat looks pretty well, but there is not a great deal of it. Few early potatoes have been planted so far. —E. R. F.

Dunn County.—Recent warm and abundant rains have helped crops a great deal. Clover came through the winter in excellent condition and is growing very rapidly. Most of the spring wheat has been sown and some oats. Winter wheat looks excellent. Because of the cold winter live stock are not looking extra well at this time. Prospects for big crops were never more encouraging.—E. A. Finley.

Eau Claire County.—Rye looks well, but there is very little of it in this locality. Clover is good in some places, but in others it winterkilled. The few pieces of alfalfa that are raised here look fair, but some of them are spotted. Little spring wheat has been sown. The seeding of barley and oats is well under way and the acreage of both these crops will be about an average. Cattle came through the winter looking a little thin because of the scarcity and high price of feed. There are fewer cattle on hand than a year ago.—C. A. Koll.

Forest County.—Farmers are plowing for oats and spring wheat. More spring wheat is being seeded this year than usual. There is scarcely any rye or alfalfa in this section, but what fields there are come through the winter in excellent condition. Clover also wintered well because of the heavy snowfall. In general, farmers had a more liberal supply of feed this past winter and the live stock were well cared for. A large increase in the number of dairy cows is in evidence.—H. H. Kamm.

Grant County.—There is scarcely any rye in this territory. Clover looks well, but it is badly in need of rain. Alfalfa is not grown much in this immediate neighborhood. Clover is not as good as last year on account of spring rains. Nearly all of the fall wheat winterkilled and a considerabe acreage will be put in spring wheat. Oat seeding is finished. There is about the usual number of live stock on hand, and they stood the winter especially well.—Al Vesperman.

Green Lake County.—Clover, alfalfa, and winter grains are looking well. Spring seeding is nearly finished and the ground has been in fine condition. More spring wheat will be planted this year than last. Pastures are starting up well, but cold weather is delaying growth to some extent. Live stock came through the winter in good condition.—G. B. W.

Iron County.—The acreage of barley and oats will be larger this year than usual, but the seeding season will be about ten days late. The acreage of potatoes will be large if enough seed can be secured. The dairy industry is increasing in this vicinity. Live stock wintered in fine conditon and they are perhaps 15% greater in numbers than last year.—J. A. Becker.

Juneau County.—Clover and alfalfa wintered well, although they are not extensively grown here. The acreage of rye is larger than usual and promises a good crop. There is an increase of about 25% in the acreage of spring wheat. A normal acreage of oats and barley will be sown as soon as weather conditions permit, but it is too wet at present. All live stock are healthy but thin in flesh. The pig crop is doing nicely.—J. H. McKnoll.

La Crosse County.—Clover, alfalfa and winter grains came through the winter in good shape. About the usual acreage of spring wheat and oats are being seeded. Recent heavy rains did considerable damage to newly seeded fields on sloping ground.—S. J. D.

La Fayette County.—The new seeding wintered in good condition, but there are some bare spots caused by dry weather last summer. Nearly all the alfalfa came through the winter in good shape and there will be a large additional seeding this spring. Oats are nearly all sown and warm rains are needed to start them. More spring wheat was sown this year than usual. Live stock wintered well. Many farmers are short of hay and other feed, and pastures are backward on account of dry, cold weather. Farmers are planting more early potatoes than usual.—W. F. Pease.

Ozaukee County.—Young clover and winter wheat suffered from winterkilling. The old clover looks fairly well. Many farmers are selling spring wheat this year. Live stock are in good condition.—M. J. Mueller.

Marinette County.—Fall sown rye came through the winter in fine condition and the prospects are excellent. Clover also is in good condition due to the heavy snow covering last winter. A good many small patches of spring wheat will be planted. Seeding of oats has been started, but the weather is a little too cold. In another week most of the small grain will be in the ground.—H. B. Pederson.

Polk County.—The weather has been fine during the past week and seeding has progressed rapidly. Most of the spring wheat is in the ground and oat seeding is well advanced. More wheat has been planted than usual. Winter grains came through in fine shape. Live stock are not in normal condition perhaps because of the scarcity of feed. Butterfat is worth from 45 to 47 cents per pound. Hogs are high priced and scarce. The soil is in excellent condition with just enough rain to start the pastures, which are showing green in some places. More gardens will be planted than usual. Altogether the prospects are very favorable.—Wallace Fountain.

Polk County.—Weather is cold and dry and rain is needed badly. Seeding is in progress and most farmers are sowing from two to ten acres of spring wheat. Oats and other crops will be about normal in acreage. It is too early to report on clover; alfalfa and rye are in good condition. Ground works up in fine shape. Young stock are doing fairly well. The milk flow has fallen off, due to the scarcity of grain feed. Early colts are not doing well and some reports say that April pigs are weak. Good grain for seed is scarce.—P. F. Amery.

Price County.—Live stock are doing extra well considering the hard winter. However, pigs suffered some from cold, and the young pig crop is below average. The demand for dairy cattle is greater than the supply. Milk cows are selling $25 higher than a year ago. Oat seeding is under way and the season is about ten days ahead of last year. The acreage of both rye and wheat is above that of last year and the weather is more favorable for small grain. The acreage planted to potatoes will be short because of the high price of seed. —W. J. Fox.

Richland County.—No rye has been sown. Clover came through the winter in good condition. Alfalfa winterkilled to some extent. Many farmers have sown spring wheat. Nearly all the oats have seen sown. Meadows look fair and are turning green. Live stock are not as plentiful this year as last. Considering the scarcity of feed the cattle look fairly well. The hay has all been fed.—E. C. Stewart.

Sauk County.—Rye and winter wheat are looking better than a year ago because of the heavy covering of snow last winter. Clover and alfalfa suffered very little from winterkilling. Oat and barley seeding is progressing slowly because of the recent rains.—Richard Klemm.

Sheboygan County.—Practically none of the rye, clover or alfalfa winterkilled and if the weather continues favorable these crops will yield better than they did last year. Spring work is advancing rapidly, although wet land is not drying out as fast as it should. A large share of the oat crop has already been sown. The acreage of oats and barley is about normal. Very little spring wheat was put in this year. One large seed firm sold only eight bushels. Because of the high prices paid for milk considerable feedstuffs were purchased and fed to dairy cows. One farmers' co-operative shipping association in this county bought over sixty cars of feedstuffs since last fall. As many as six cars were received in one day. Dairying will continue to be the main industry here, which will mean an increasing acreage of silage corn, clover and alfalfa.—J. M. Hoppert.

Taylor County.—Spring is backward in this locality. Very little has been done toward seeding oats and barley because the ground has been very wet and cold. Clover came through the winter in fine condition. There is no alfalfa to amount to anything in this county. Rye is slow in starting. Cattle and hogs are in good condition. Feed is scarce and high priced; oats are worth from 80 cents to $1.00, hay from $12 to $15, spring pigs $10 to $12 a pair. Farmers are anxious to get into the fields.—John E. Miller.

Let the Children Help.

This year above all other years every ear of corn used for planting should have back of it a record for germination. Planting a week ear or one that fails to grow reduces the yield of an acre from five to eight bushels. Every poor ear means a loss per acre of from $3 to $5. If food continues to become scarce it will mean more. It costs just as much to plant, cultivate and harvest a poor stand and crop of corn as to care for and harvest a bumper crop. The difference in yield is largely in the seed.

With the heavy amount of work now before the farmers much corn that the owner would like to test will remain untested unless some arrangement can be made to have it done by someone else. Testing corn has been taught the children by the country teachers in their agricultural courses and hardly a child lives in the country today that is not acquainted with the method of testing. The young people can test the seed corn that the father is too busy to test. Give them an opportunity to do so. It will not take long for you to check up their work and convince yourself that it has been done right. School children could well put in their time during the next few weeks testing corn for their parents or neighbors in order that every ear planted in 1917 will be known to be of strong vitality. Insure a higher yield and superior quality by making some arrangement to weed out the weak and dead ears before planting. A 100 per cent stand ought to be the ambition of every farmer this year above all others.

Potatoes and Seeds Almost Given Away.

To Introduce—I will send seed for 10 big hills, true **"Early Six Weeks"**—by far the earliest and best table potato on earth—enormously productive and best keeper, also 10 varieties best "Butter" and "Head" lettuce, 5 varieties best Pop Corn, 300 varieties lovely, easy-growng flowers, and a valuable novelty. All mailed for **two dimes** or 24 cents in stamps. ☞All the seeds and 30 hills potatoes for 50 cents. Seeds and 70 hills $1. More at same rate. Order quick. Tell your friends. Address, **A. G. Cook (Potato Specialist) Hyde Park, N. Y.**—Adv.

Culvert Iron a Pure Product.

In the April 5th issue of our publication there appeared an advertisement of the Armco Iron Culvert and Flume Association in which was stated that "Armco iron is never less than 98.84 per cent pure." This should have been "99.84 per cent." The error was made, not through any fault of ours, but through a mistake in the making of the plate furnished by the advertiser. The association have asked us to make this announcement correcting the error and, feeling their request to be a reasonable one, we are publishing this paragraph.

Ford Car For Belt Power.

A BELT power attachment, the Schluter, that connects with the crank shaft of a Ford car, is advertised in this issue, page 14, by the E. F. Elmberg Co., 124 Main St., Parkersburg, Iowa. It is a simple piece of machinery, and can be put on or taken off in fifteen seconds. The Elmberg Co. guarantee this attachment to be 8 H. P. capacity, and especially recommend it for its portableness. The Schluter sells for $22.50 and is sold direct by the factory, and through county agents. Write them for big illustrated circular.—Adv.

How Robt. Roth Picked Out His Spreader.

The Story of a Michigan Farmer Who Got the Biggest Profit From His Manure Crop---As Told by Himself.

WHEN Robert Roth, of Quincy, Michigan, decided to buy a manure spreader he was just as much at sea as thousands of others who are also in the market for manure spreaders. He read all the advertisements in the farm papers and scarcely knew which one to answer. He wrote to the manufacturers of manure spreaders for their catalogs and decided for himself just which

spreader was best suited to the handling of the manure crop on his farm; then he bought a machine, and here is what he says about it:

Dear Mr. Galloway:—I thought you no doubt would like to know how I like my Galloway No. 1 A spreader, recently purchased of you, so I wish to say you have got the best spreader that is on the market today. There are many points that are far ahead of other spreaders on the market. My two horses handle it with perfect ease, with the manure heaped away above the sides. No matter how high you pile the manure it takes it right off with ease. I wish to call special attention to the force feed push board which is a great improvement.

I had another spreader last year and there was always five or six bushels of manure left in the box that I had to pitch out with a fork or else haul it back to the barn. But my new Galloway cleans out all of the manure perfectly to the last bit; this is a big item. The all-steel beater and steel rake are great improvements; in fact, every part is very simple and not subject to much wear and puts other spreaders simply out of date.

In conclusion I wish to say that any farmer that is going to buy a spreader, my advice is, "Don't buy one of those big, cumbersome, horse-killing machines; get a Galloway and you will never regret it." I saved just $49 by buying a Galloway besides getting a better machine.

The points that stand out prominently in Mr. Roth's letter are these: Two horses handle his new machine with perfect ease when it is loaded very heavily; the patented force feed cleans out the spreader box thoroughly; the new Galloway steel beater and steel rake are great improvements, and he saved just $49 in buying a Galloway machine, besides getting what he thinks is a better manure spreader.

Why should any farmer use an old out-of-date spreader—a horse killer—one that does not clean thoroughly, when he can have an up-to-date piece of machinery just like Mr. Roth's? Wm. Galloway, of Waterloo, Iowa, the spreader inventor and manufacturer who has been more closely associated with the development of spreaders in America than any other man, will be glad to send his latest book about spreaders to anyone who inquires and mentions this paper.

Look at this picture of Mr. Roth and determine now to get the Galloway book about manure spreaders and have the same kind of spreader satisfaction that Mr. Roth describes above. —Adv.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

A Few Hints on Duck Culture.

To the Editor:—We are sure there are many who will read with interest some of our experiences with the different varieties of waterfowl. We will not bore the reader with a long description of the best varieties of ducks, but we believe that many may derive some benefits from a brief description of some of the more popular varieties.

First, we will take up perhaps the most widely known duck—the White Pekin—a Chinese production. They are, or should be, a bird as near white in plumage as is possible. Creaminess is not desirable for a fancy exhibition bird. In size they are considered one of the largest of ducks, are considered a very good market duck, and mature quite rapidly under proper conditions. As layers we cannot call them as prolific as some other varieties, producing, generally, fifty to 100 eggs each annually. They are good foragers and are hardy.

Next we will take up the Indian Runners, there being two varieties of Runners—fawn and white, and white. The size and general qualities of the two varieties are very much the same. Our experience with them has been that they are the same to the duck family as the Leghorn is to the chicken, their strongest point being the production of eggs. As a table duck we cannot recommend them as highly as others. As you will note by market reports in our cities, they undersell other varieties. They are hardy and are great rangers.

Then we have the Mammoth Rouen—a French production—a bird that is unrivaled among domestic varieties for general utility qualities, both as to shape and size as well as plumage. The drake resembles the wild mallard males considerably, except that they are a shade darker and the lines of color break off more distinctly. The female is doubly penciled with mahogany on black in all sections. Their bodies are long and very deep keeled, the same being carried about horizontally. As a table duck they are unrivaled, the meat being of fine texture, juicy and of high flavor. As layers they are very prolific for a bird of their size, generally producing from seventy-five to 120 eggs each per season.

We leave the matter of selection of a variety entirely to the reader, for we do not know his particular wants.

The incubation of duck eggs, either artificially or with hens, is as easy as with chickens. It takes twenty-eight days for a duck egg to hatch. We do not feed for from twenty-four to thirty-six hours after they are hatched and dry. However, we put them in a box with bottom covered with dry sand and let them pick at that. We geenrally start them on stale bread soaked in milk and squeezed dry, letting them have all they will eat from three to five times daily. We always furnish plenty of water at eating times. After they are a week or ten days old, we feed a mixture of ground corn, bran and middlings, equal parts, adding one-tenth part, by weight, of meat scraps. After mixing this thoroughly, we make it into a crumbly mash (not mushy or sloppy), using sweet skimmed milk or water to dampen. We feed this four times daily. This should be fed in a trough, and never feed more than they will clean up, always keeping plenty of clean water before them.

We always put them in a small enclosure where they have access to all the green grass they want, and take particular care they are protected from beating rains and storm. The main causes of losing ducklings are insanitary quarters and improper feeding, which may develop stomach trouble, which we have found in some cases hard to combat. However, we think that if one uses ordinary judgment, the casualties from raising ducks will be much fewer than in the case of chickens.

We do not recommend a pond or running water for ducklings until they are fully feathered.

Try and increase your poultry profits by raising a goodly flock of ducks each year. John D. Bowman.

$9.25 BUYS World's Champion Belle City Incubator

140-Egg Size—Hot Water—Fibre Board, Double Walled—Self Regulated—Thermometer Holder—Deep Nursery, with $5.25 Hot Water 140-chick Brooder—both $13.50. EGGS—PRIZE-WINNING BUFF ORPINGTONS. Mrs. Harry Hardwick, 2220 Pleasant Street, Janesville, Wisconsin.

Our Farm Help Column

For a limited time The Wisconsin Farmer will publish free under this heading the names and addresses of those who want farm help or jobs on farms. Send all communications to the publisher. Names will be published only once.

HELP WANTED.

E. W. Carr, St. Lawrence, S. D. Single man wanted for stock farm.

Col. W. Russell, Winfield, Kan., two hands wanted to drive mowers and sweep rakes.

E. G. Carner, Gilmore City, Iowa, man for general farm work.

W. W. Day, Janesville, Wis. Wanted, man for general farm work. Not much milking.

Frank Frimmel, Liscomb, Iowa, wanted, man and wife—no children.

Frank E. Klicko, Sharon, Wis. Wanted man. Eleven cows to milk.

JOBS WANTED.

B. U. Orr, 1123 South Third Street, Cedar Rapids, Ia. Experienced. Wants $1.50 a day, paid weekly.

Charles Rundell, Livingston, Wis., single, salary wanted $40 per month, experienced.

Potatoes For Everybody.

Choice seed for **10 hills** true **"Early Six Weeks,"** earliest potato on earth and of superlative quality. Also 315 varieties superior Vegetable and Flower seeds. All safely boxed and mailed postpaid for **two dimes**, or 20 cents in stamps. 30 hills potatoes and the seeds for 50 cents. 70 hills and seeds, $1. More, same rate. Address, **A. G. Cook (Potato Specialist) Hyde Park, N. Y.**—Adv.

Cream Separator Information.

A CREAM separator is an asset on every farm and the only question is, "What make shall I buy?" Starch Bros. Co., La Crosse, Wis., have been making a standard separator for the past fifteen years—modern in every respect. Until recently they have been supplying the mail order houses, but now they sell direct to the farmer. Send to the above firm for their book of information descriptive of their machine. Notice the advertisement on page 20.—Adv.

Ask your neighbor to subscribe for **The Wisconsin Farmer**.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

POULTRY AND PET STOCK.

TAIL HOLDERS.

COWS' tail holders, post paid; sample 12c. 5 o. more 10c each. F. C. Gieseker, Elmwood, Wisc

FARM LANDS.

NORTH DAKOTA is essentially an agricultural state. In the past five years it ranked first in production of wheat twice, twice it was second and once third; always first in production of spring wheat; also flax, equaling production of all other states. Once it was first in barley, never below third; never below seventh in rye and oats. Has made great increase in corn and stock. You can still obtain home there without commission to us, while land is still cheap. Easy terms. Write AT ONCE, for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Building, Minneapolis, Minn.

TO help increase the country's volume of grains and other food products I am offering to sell about 5,000 acres choice agricultural lands near the cities of Superior and Duluth in 40, 80 and 160-acre tracts at low prices and on five to ten years' time, without any payment whatever on principal for two years, to any one who will clear and cultivate a part of the land at once. For full particulars write to W. H. Webb, Superior, Wis.

BUY land now! Do it before the advance that the season's rush is bound to create. Buy it while you can take your choice from our 25,000-acre tract that our company is selling to actual settlers. We have spent thousands of dollars building roads and opening it up. Our illustrated literature is free for the asking. Flambeau River Lumber Co., Station D, Ladysmith, Wis.

80-ACRE improved farm, three miles from Coleman, Marinette county, Wisconsin. 65 acres under plow, balance pasture. Good live creek runs through the 80. Fair house and barn; new tile silo. Price only $9,000.00 with lots of personal property. This is a big snap. One-half cash, balance on time. G. W. Ristau Land Co., Dept. A, Kaukauna, Wis.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, L and Department, Stanley, Wis.

FREE—We are interested in seeing the low-priced farm lands around our home developed. If you are looking for land, just write me and say: "Without any cost to me, tell me how you got your farm home." Address Mrs. Lucy L. Ferguson, B-26, Cedarville, Marinette county, Wis.

LAND clearing made easy, tells about stump removal by modern machinery. Write for it today, and other facts about cheap upper Wisconsin land. Wisconsin Advancement Assn., 1590 First Nat. Bank Bldg., Milwaukee, Wis.

GOOD corn, clover and grain land; improved, partially improved, or unimproved, at prices ranging from $15 to $100 per acre; best of location and soil. Write us now. W. E. WEBSTER, Hudson, Wis.

CORN farm, 400 acres, highly improved, 3½ miles from Lake Andes, Charles Mix county, South Dakota, located south of the north line of Iowa. For sale on easy terms. Homer W. Johnson, Sioux City, Iowa.

GOOD 120 cheap, 5 acres plowed; good pasture; considerable timber left; lies rolling; nice lake; 7-room house; log barn; 8 miles to station; $2,000, cash $900. The E. L. C. Co., 136-M, Dept. 10, Merrill, Wis.

BIG bargain, 80-acre improved stock and dairy farm 2 miles from Athens, $55.00 per acre. Write for particulars. John Brann Lumber Co., Athens, Wis.

MARATHON County Farms for sale. Bargains. Geo. Ritger, Cashier State Bank, Marathon, Wisconsin.

FOR SALE—Fine small farm home on one of Wisconsin's finest lakes. S. W. Gregory, Stone Lake, Wis.

SEEDS.

FREE SEED CORN, samples and circular. Northern home grown, hanger dried, heaviest yielding, early varieties. W. C. Bryant, Princeton, Illinois.

GOLDEN Glow and Clark's Yellow Dent seed corn for sale. Wisconsin grown and fire dried. Burton Peck, Spring Green, Wisconsin.

BLACK Hills alfalfa seed, $6.00 per bu. For sample send stamp to Brookside Farm, Buffalo Gap, So. Dak.

CABBAGE, celery, tomato plants. 100, $1.00 delivered. Riverview Nursery, Des Plaines, Ill.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer quickly and honestly. Investing for Profit is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200 were now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. Owner will have privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

GUERNSEY CATTLE.

REGISTERED Guernseys, both sexes, six few good cows and heifers, guaranteed. Cloverneck Farm, Waterloo, Wis.

GOVERNMENT JOBS.

FARMERS wanted, $75 month, men and women; U. S. government jobs. War means hundreds vacancies. Country must be searched at once. Write immediately for list positions available. Franklin Institute, Dept. C-76, Rochester, N. Y.

CHESTER WHITE PIGS.

CHESTER White fall pigs sired by W. B.'s Wonder now ready to ship. Wm. F. Belda, De Forest, Wisconsin.

A Modern Badger Creamery.

Ventilation Plant Installed at Mt. Horeb Creamery Pleases the Buttermaker and Makes Him Feel More Like Sticking to the Job.

MT. HOREB'S $20,000 creamery began operations on March 23d. The new building, 36x80 feet, fills a long-felt desire on the part of the Mt. Horeb dairymen to produce their butter under modern conditions. The old building, located some distance out of town, had served its purpose well during the sixteen years of its existence. For a number of years, however, it was evident that the community had outgrown this building, so in 1915 the association decided on a new plant to be built in the city of Mt. Horeb.

The building is of brick and has two stories and a basement. The basement contains the ice machine, boiler and engine and the large casein vat, for, beside ice cream and butter, the creamery also manufactures casein for commercial trade. On the first floor at the front is a large office 16x20, and next to it the refrigerator, 12x12, and a smaller room for hardening ice cream. The temperature in this room is constantly in the neighborhood of 20 degrees below zero. The main room, the creamery proper, is 34x60 feet, and is so arranged that milk can be taken in on one side and the cream on the other. A hook lift has been arranged so that the cans are transferred from the wagon to the creamery without being handled by the farmer or creamery man. At the rear of the creamery a skim milk spout is located and here the farmers draw the pasteurized skim milk that is coming to them. Everything on the floor is arranged so as to be most practical for working purposes. There is a churn, two ripeners and three separators, an ice cream freezer and an ice crushing machine. In one corner a room 8x8 has been built for the testing of milk, cream and moisture and salt in butter. On the floor above is a large store room where the empty tube and materials for packing the product can be kept. Leading off from this is a separate room for the tank which supplies the water to the creamery. Water is pumped to this tank from a well in the basement; thus the creamery is not dependent on an outside water supply. The balance of the top floor is to be the hall for the Masonic lodge of Mt. Horeb. An elevator carries tubs and other materials from one floor to another.

One of the main features of the creamery and the most welcome improvment over the old building, in the estimation of Herbert E. Griffin, who has had charge of the buttermaking for the last six years, is the modern system of ventilation which has been installed in the creamery. Mr. Griffin is emphatic in stating that a ventilating system is absolutely necessary for a creamery today. Under the old system cellar conditions in the creamery resulted in considerable damage to machinery and building and above all to the health of the workers. The moisture-soaked atmosphere in a creamery without modern ventilation as in the old creamery breaks down the health of the strongest person, causing unfailing severe cases of rheumatism. Mr. Griffin states that under no conditions would he again work where a proper ventilation system has not been provided. There is constant danger during the winter months of catching cold by stepping from the overheated damp creamery onto the platform or returning home at night. The moist clothing exposes the creamery man to severe cases of cold. Good buttermakers are scarce and in these days none of them are without a position very long. The buttermakers of today can and are demanding certain conveniences which will insure their working under healthy conditions.

The two-fan modern system that has been installed at the Mt. Horeb creamery is planned along scientific lines and guaranteed to keep the air in the building fresh and the atmosphere partially dry. Fresh air intakes which bring the fresh air into the building and foul air flues to carry out the bad odors and moist air are the first principles of ventilation. However, creamery conditions necessitate a further aid to get rid of the large amount of steam which is always present in a creamery. Where steam condenses it settles to the floor in the form of water, making the air moist and heavy. To rid the creamery of the steam rapidly the Mt. Horeb system is so arranged that two openings in the ceiling, each about two feet across, which have in them a fan connected with the drive shaft, take care of most of the live steam as it is liberated. The fan sucks the steam up and drives it out as fast as it reaches the ceiling. A large amount of it condenses, nevertheless, and this is carried away by the floor flues. These floor flues begin about twelve inches above the floor and lead up to aerators on the roof. The wind blowing across the top of these aerators creates a suction, thus carrying out the heavier air that settles to the floor.

The Mt. Horeb creamery sells each year approximately 300,000 pounds of butter and a large amount of casein and ice cream. There are about 400 patrons in the association. The organization is on a coöperative basis, each patron having an equal share and vote. A president, secretary and manager and two other members form the executive committee or board of directors, who handle the affairs of the creamery. The buttermaker, Mr. Griffin, goes under the name of assistant manager and has under him two helpers. The untiring efforts of Mr. Griffin to make the new creamery as modern and practical as possible deserve special mention.

MT. HOREB, WIS., CREAMERY, JUST RECENTLY OCCUPIED.

Thousands of women are being recruited for agricultural service in England. More than 800 training centers have been established in England for instructing the women. Terms under which the women are recruited are that they shall be furnished board and lodging during the period of training; each shall be given a free outfit consisting of high boots, breeches, two pairs of overalls and a hat; the wage shall be $4.20 a week or the wage rate of the district, whichever is higher. In some cases the women workers are being housed in the towns and taken to the farms each day; in others they are staying at the farmers' homes. The welfare and supervision of the girls during training and after will be controlled by experienced women, carefully selected by the women's war agricultural committees in each locality.

YOU find men who are proud of themselves are mighty ready to learn about the little nibble of W-B CUT that does away with so much grinding and spitting. As soon as they learn to tuck away a little of the shreds in their cheeks and to let it alone, they find out the difference there is between *rich* tobacco and the excess-flavored stuff. The touch of salt in W-B helps to bring out the tobacco satisfaction.

White Grubs Are Serious Pest.

Time Now to Prepare to Fight Them—By L. G. Gentner, Wisconsin College of Agriculture, Madison, Wisconsin.

TO MOST growers the white grubs are too well known to need any description. They have long been a serious pest to field and garden crops and have caused enormous losses, especially in southern Wisconsin, northeastern Iowa, northern Illinois, parts of Minnesota, southern Michigan, northern Ohio, northeastern Pennsylvania, southeastern New York and parts of Connecticut and New Jersey. In these regions the white grubs have a three-year life cycle and cause the greatest loss every three years, namely, 1918, 1921 and 1924. In order to avoid as much injury as possible in 1918, it is necessary to use cultural methods in 1917 and to practice crop rotation.

To fight the white grubs successfully it is necessary to know something about their habits. The grubs come from eggs laid in the ground by May beetles or June bugs. These are stout, reddish-brown to blackish

THE MAY BEETLE OR JUNE BUG, EXPECTED IN LARGE NUMBERS THIS YEAR.

beetles which may be seen flying about lights or bumping against the windows of a lighted room. They are expected to appear in large numbers this spring, the same as in 1914, when they will feed for a time at night on the leaves of oak, elm and other trees, and then lay their eggs in grass or weed lands or in fields planted to small grains or timothy. From these eggs tiny white grubs will hatch and feed on the roots of plants until late in fall when the ground begins to freeze. They will then go down into the soil below the frost line for the winter. In the spring of 1918 they will come up near the surface of the soil and feed on the roots of whatever plants may be growing there. That will be the year in which the greatest damage will be done, for the grubs feed from early spring until late fall, during which time they become nearly full grown. Late in the fall of 1918 the grubs will again work their way down into the soil below the frost line. In the spring of 1919 they will once more come up near the surface of the soil and feed for a short time on the roots of plants. Toward the first of June they will become full grown and make cells in the soil about three to eight inches below the surface. In these cells a change in form takes place and they go into a resting stage and are then called pupae. After several weeks these pupae undergo a change and adult beetles come forth. The beetles will remain in the cells until the spring of 1920, when they will come forth to lay their eggs in the same way as did the beetles in 1917. The beetles are expected to appear in large numbers every three years (1917, 1920, 1923) and the white grubs which hatch from the eggs laid by the beetles will do the most serious injury the year after the beetles fly in great numbers (1918, 1921, 1924).

The white grub.

Where practical one should not allow land to remain in grass, weeds, small grains or timothy in 1917, for [illegible] prefer to lay their eggs on [illegible] land. Wherever it is possible [illegible] so one should avoid planting corn, strawberries, potatoes or other root crops in 1918 on land that has been in grass, weeds, small grains or timothy in 1917. Land that is planted to corn or root crops in 1917 and kept well cultivated will contain few white grubs in 1918, for the beetles prefer to lay their eggs elsewhere. If it is necessary to plant wheat in 1917, the land should be planted in 1918 to timothy and grain, or to clover, peas and beans, which are not readily attacked by the grubs. Deep plowing and harrowing previous to October 1st in 1917 and 1918 will crush many grubs before they go down into the soil for the winter. Deep plowing and harrowing in 1919 as soon after July 15th as practical will crush the pupae and newly formed beetles which will still be in the cells in the soil. Early plowing in the spring of 1917 will crush many of the beetles before they come out of the ground. Chickens and hogs allowed to run over freshly plowed fields will destroy a great many grubs. Some of our common birds, especially robin redbreasts, pick up large numbers of the grubs and even some of the adults.

$22.50 and your FORD Makes 8 H.P. Gas Engine

County Agents Wanted

"The Biggest Little Thing on the Farm"

Here's power for your farm as reliable as your Ford engine, and portable as your Ford car. Guaranteed 8 horse power capacity or your money back. Costs you less than one-sixth the price of regular 8 horse power engine.

On or off in Fifteen Seconds **Schluter** Auto Belt Attachment

If you own a Ford you should own a Schluter, too, which will give you power for your farm, anywhere you need it. Easily attached. With our improved crank socket and detachable crank handle, you just hook on Schluter, put in the crank give it a whirl, and start to work. Now used and praised by farmers from Maine to California. Positive proven success and sold with our five-day free trial, money back guarantee. Order direct from this ad or send for big free circular—ready to mail.

E. F. ELMBERG CO., 124 Main Street, PARKERSBURG, IA., U.S.A.

Planting the Garden.

To the Editor:—The first and most important part of a good garden is a well-prepared seed bed. The soil should be free from sticks, stones and clods, and should be in perfect tilth. It may be necessary to rake the garden three or four times and use a hoe or the back of the rake to break up the lumps of soil, but such extra labor is well repaid.

After the soil is in condition for planting the rows of the garden may be laid out according to the plan previously prepared. There should be two permanent stakes at each end of the garden and then all measurements made from these stakes. The rows may be marked by putting small sticks or labels at each end of the row on which is written the name of the vegetable. It is then a very simple matter to get the rows straight by stretching a line and planting under it.

Only fresh, viable seed should be used. It is a good plan to test the germination of old or doubtful seed. This may be done by counting out 100 seeds and planting them in a shallow box filled with sand. If the seed germinates quickly and evenly and germinates more than 75 per cent it is satisfactory. But if it is slow and irregular in germinating and sends up weak sprouts or germinates less than 75 per cent it should be thrown away. The exception is parsnip, which often germinates as low as 50 per cent.

Viable seed need moisture, air and warmth to germinate. Seeds must absorb moisture from the soil before they germinate. That is why they often lie dormant for two or three weeks in dry soil before they sprout. Firming the soil over the seed to establish capillarity, planting the seed deeper in dry soil and sprinkling the soil after planting are ways of supplying moisture to the seed.

Because it shuts out the air and often causes the seed to rot too much moisture is almost as bad as not enough. Thorough drainage or lightening the soil with sand or manure will usually correct this condition.

Wisconsin Station. J. R. Hepler.

The simplest, most efficient and lowest priced spray pump on the market. No suction; no packing to wear out. Use in bucket, keg or barrel. —FOR DISINFECTING— with any kind of liquid, whitewash, etc., as well as for spraying trees, shrubs and plants. No sediment can settle in pump; can not clog. The price is low. Write for details or ask your dealer.

Peoria Hydraulic Pump Co. Peoria, Dept. 5 Illinois

The Control of Garden Pests.

By James G. Moore, Wisconsin Experiment Station

Below is given a list of the more common insect pests of vegetables, with methods of control and formulae for spray mixtures. Control methods are stated by number. See "methods of control" table below.

COMMON GARDEN INSECTS OF WISCONSIN.

Vegetable	Insect	Stage in which damage is done	Damage	Control method
Asparagus	Asparagus beetle	Adult larva	Eats foliage and young shoots	1-2
Beans and peas	Pea weevil	All stages	Burrows in seed	3-4
	Bean weevil	All stages	Burrows in seed	5
	Pea aphis (louse)	All stages	Sucks juice from foliage	6
	Blister beetle	Adult	Eats foliage	2-7
Beet	Flea beetle	Adult	Eats foliage	2-7
	Leaf beetle	Adult	Eats foliage	1-2-7
	Beet aphis (louse)	All stages	Sucks juice from foliage	6
Cabbage	Cabbage maggot	Larva	Base of stems and roots	8-9
	Cabbage worms	Larva	Eats foliage	2-10-11
	Cutworm	Larva	Cut off plant	(See general)
	Cabbage (aphis)	All stages	Sucks juice from foliage	6
	Cabbage leaf miner	Larvae	Mines through leaves	12
Cucumber	Cucumber beetle	Adult larva	Eats foliage, destroys roots	2-13-14
	Squash bug	Adult larva	Sucks juice from foliage and stems	1-13-14-15-16
	Pickle worm	Larva	Eats fruit	1-10
	Melon aphis	All stages	Suck juice from foliage	6
	Squash vine borer	Larva	Burrows in vine	1-12
Celery	Celery caterpillar	Larva	Eats foliage	14
Corn (sweet)	Cutworm	Larva	Cuts off stem	(See general)
	Corn ear worm	Larva	Eats seed on cob	2-19
Melon	Same as for cucumber			
Onion	Maggot	Larva	Burrows in bulb	No satisfactory method
Squash	Same as for cucumber			
Radish	Maggot	Larva	Burrows in roots	No satisfactory method
Potato	Potato beetle	Adult larva	Eats foliage	2-7-10-14
	Potato flea beetle	Adult larva	Eats foliage	2-7
	Blister beetle	Adult larva	Eats foliage	2-7
	Potato stalk borer	Larva	Burrows in stem	9
Tomato	Tomato worm	Larva	Eats foliage	14
	Tomato stalk borer	Larva	Burrows in stem	9
Eggplant	Flea beetle	Adult	Eats foliage	2-7
	Potato beetle	Adult larva	Eats foliage	2-7-14
General	Cutworm	Larva	Eats foliage and base of stems	17-18
	Leaf beetles	Adults	Eats foliage	1-2-7
	Blister beetle	Adult	Eats foliage	1-2-7
	White grubs	Larva	Eats roots and base of stems	19

METHODS OF CONTROL.

1. Trap plants. 2. Dust plant with air-slaked lime and Paris green or arsenate of lead. Repeat at intervals as often as insect reappears. 3. Fumigate seed with bisulphide of carbon before planting. 4. Soak for one minute in boiling water. 5. Same as three, but as soon as harvested. 6. Kerosene emulsion or nicotine sulphate. Nicotine sulphate at times gives undesirable flavors to salad crops. 7. Bordeaux mixture containing arsenate of lead or Paris green. 8. Protect plant by tarred paper protector about three inches in diameter fitted closely around base of plant. 9. Burn badly infected plants as soon as discovered. 10. Apply arsenate of lead or Paris green in liquid form. 11. Fresh hellebore or pyrethrum may be substituted for 10. 12. Destroy infected part as soon as discovered. 13. Cover plants with hill protectors. 14. Hand picking—Should be done daily until further injury is unimportant. 15. Use traps—boards, sticks, clods, stones; adult insect hides under them. May be found in early morning or late evening. 16. Mash eggs—usually found on under surface of leaves. 17. Poison bait—(1) vegetable—spray clover with Paris green or arsenate of lead; scatter fresh material around plants in evening. (2) Bran mash—white arsenic or Paris green, one-fourth pound; brown sugar, one-fourth pound; bran, ten pounds. Mix thoroughly and add enough water to make a damp mash. 18. Dirt bands, tin or strawberry box protectors. 19. Fall tillage.

HOW TO MAKE THE SPRAYS.

Arsenate of lead (powder) or Paris green, liquid—one ounce to six gallons water.

Arsenate of lead (powder) or Paris green, dry—one ounce to three to four pounds air-slaked lime or flour.

Kerosene emulsion—5 to 7 per cent kerosene.

Nicotine sulphate (40 per cent) one part to 700 to 800 parts water. Add small amount of soap solution.

Bordeaux mixture 4-4-50 formula.

What Testing a Cow Did.

Cow-testing associations are increasing from year to year, but not nearly so fast as they ought to or as their value justifies. We still have too many cows that are unprofitable and too many good ones that are not appreciated as they should be, simply because their owners do not know how much better or poorer one cow may be than another. There is only one way to ascertain the value of a dairy cow and that is by weighing and testing her milk at intervals sufficiently often to enable the owner to make an intelligent estimate of her annual production as well as the annual cost of her feed.

Breeders of pure-bred dairy cattle are frequently big losers because they do not have their cows officially tested and, therefore, have nothing to show the prospective buyer how good a certain animal may be and what her ancestors before her did. This is illustrated by the following statement made by a Canadian breeder in a recent issue of the Holstein-Friesian Register:

I once offered an eleven-year-old cow for $150 to a man who was buying for the West. Shortly after she gave me a fine heifer. As we were doing some testing at the time we also started this old cow, and very much to my surprise she finished up by making 29.5 pounds of butter and 565 pounds of milk in seven days. Her best day's milking was ninety pounds. I have since refused $800 for her. This goes to prove the value of testing.

The intrinsic value of that cow was not enhanced by the testing, of course, but it showed that she was a much better producer than this experienced breeder realized. He had owned that cow for eleven years without appreciating her real worth. Had he known her value several years before her heifer calves would undoubtedly have been retained in the herd and her bull calves have sold for much more money. The difference in the selling or breeding value of a high and an average testing grade cow would not be so great as in the case of a registered animal, but in many instances it would represent a big sum. The breeding up of a high-producing grade dairy herd cannot be intelligently done without testing and weighing of the milk of each individual cow; neither can the poorer ones be weeded out without a knowledge of the cost of production of the several animals in the herd.

Join a cow-testing association if you can; if not start to test your own cows at least once a month and weigh their milk about once a week and from the results thus obtained manage your herd intelligently. More progress can be made along intelligent breeding and weeding lines than most farmers realize.

The Mechanical Milker.

The increasing difficulty of obtaining help on the farm, especially on dairy farms where from thirty to forty cows are kept, is causing many to inquire about the practicability of milking machines; whether they are really labor savers and whether they do good work. It cannot be said that the milking machine is meeting with universal approval, but we are convinced that it is not the fault of the machines that they do not satisfy everyone, but rather the fault of some people who expect too much of a machine. Many men have discarded milking machines even after having used them for several years. On the other hand, many more are using them every day and would not think of dairying on a large scale without them.

This difference of opinion among farmers and dairymen is not peculiar to one make of mechanical milker, but to all of them. We have seen the highest-priced machines on the market discarded by some men and very much eulogized by others. The same thing has been observed of the cheaper machines. The success of the milking machine, in our opinion, depends very largely upon the man who runs it. It requires intelligence to use a milking machine to advantage. You can't pick up a hobo and expect to make a successful milking machine operator out of him. Some hoboes can milk by hand; however, the majority of them are poor milkers. They usually dry the cows up unless watched very carefully, but it is utterly out of the question to trust a hobo with a milking machine and expect to get results. Intelligent labor is necessary, as is usually the case with machinery.

An intelligent dairyman will have no trouble with a milking machine, because he recognizes that each cow has an individuality of her own and that each must be treated as an individual if best results are to be obtained. A man who knows his cows in that way can get results with a milking machine if he wants to. Now and then cows are found that cannot be successfully milked with a machine, but there are very few of that kind. For that matter, there are cows that cannot be successfully milked by hand, or at any rate they cannot be milked by hand in comfort. One or two cows, therefore, may have to be eliminated from a herd of thirty or forty when a machine is first introduced. Heifers seldom, if ever, object to the use of milking machines.

One should always strip a cow after she has been milked with a machine, although in many instances one cannot get more than half a pound of milk from the strippings. Of course, it is important to get that half pound, as every man knows, otherwise cows are apt to dry up. Every particle of milk must be removed from the udder after each milking, besides by handling the udder after each milking one always knows its condition.

A man who milks from fifteen to twenty cows and has to depend upon one or two hired men to do the milking for him would in many instances be better off with a machine and do the milking himself, because it saves labor and besides it transforms the rather disagreeable job of hand milking into pleasant work.

Productive Dairying.

Prof. R. M. Washburn, of the dairy department of the University of Minnesota, is the author of an illustrated volume bearing the title "Productive Dairying." It contains the results of all recent experiments conducted by the various stations during the past decade, and the volume, if widely distributed, will do much toward improving the dairy industry. One chapter is devoted to the care and management of dairy cows, another to winter feeding, still another to clean milk production, and considerable attention is given to the marketing of dairy products. The publisher's price of this volume is $1.75 and The Wisconsin Farmer will supply the volume to its readers at this price.

Stockholders of the Farmers' Cooperative Packing Company, of Owatonna, Minn., will receive $65 on every $100 of paid-up stock as their pro-rata share of the assets of the company, which has dissolved. Payment is to be made May 27th. More than 1,500 stockholders are interested in the company, which was organized to build a $300,000 coöperative packing plant.

EVERY FARMER WHO BUILDS A SILO
Should Use In its Construction
DRICO EXPANSION DOORS
DRICO INTERLOCKING HOOPS
Drico Expansion Doors are mentioned by the Hemlock and Hardwood Manufacturers' Association of Wisconsin in the Korn Keep Silo specifications for economy and convenience. No patented silo door equals the Drico. They make a silo air-tight and provide for possible expansion caused by heating of the ensilage during fermentation. The crank arm, which easily operates the door, forms a combination lock and ladder.
Drico Interlocking Hoops are made of wood, 4-ply thick, steamed and rolled to the correct curvature. In using these hoops the silo will be perfectly round, permitting an even settling of the ensilage. Hoops never need tightening, nothing can get out of order.
Both Drico Doors and Drico Hoops can be gotten from the lumber yards owned by the members of the Hemlock and Hardwood Manufacturers Ass'n of Wisconsin and from lumber dealers in general. If your local lumber yard cannot supply you, write direct to us For Free Booklet and prices.

EAGLE Anti-Clog Ensilage Cutter
Eagle Cutters are known for their great strength and power, yet they are the very acme of simplicity. You start, stop and reverse the Eagle Cutter instantly—all with the same lever. Positively safe for any one to use. Safety Cylinder Head does away with the possibility of damage to knives. Improved Rollers—upper one grooved, lower one spiked, give 50% greater feeding power. Positive speed relation between cutting head and fan makes the Eagle absolutely anti-clogging. These and other special features make it the safest, most powerful, most economical ensilage cutter you can buy.
Send today for free booklet showing all sizes of Ensilage, Feed and Fodder Cutters.

Use More Corn Meal.

Wheat is high in price and the housewife who makes use of more wheat-flour substitutes will materially cut down the cost of food for her family and will at the same time be performing a patriotic duty in helping conserve the wheat supply of the country. Corn naturally takes first place as a wheat-flour substitute and there are innumerable ways in which it can be utilized in the diet.

Did you know that in making light bread corn meal can be substituted for wheat flour in any proportion up to 25 per cent of the total flour required? The texture of such bread is a little poorer than if made from all wheat flour, but it is light and spongy, wholesome and very palatable. Corn meal can be substituted for half the flour in making gems and muffins and many prefer pancakes made of corn meal alone. The batter in each case must be made thinner than in the case of wheat flour, as the coarse meal absorbs more moisture in baking.

But bread is not the only way in which corn meal can be used. Well-cooked mush with cream or milk is as palatable a breakfast or supper dish as you could wish. Then, too, the mush may be fried or combined with fruit or with cheese. Fish cakes with corn meal are good, and puddings and even doughnuts and cakes are made with corn meal as the basis.

Now as to the economy of using corn meal in place of wheat flour and cereals. At present retail prices corn meal costs about half as much per pound as wheat flour, one-third as much as rolled oats, one-fourth as much as rolled wheat, and about half as much as broken rice. In other words, while corn meal compares favorably with wheat flour and other cereals in the matter of food value, it may be had at a much lower cost per pound.

Unbolted corn meal, that is, meal made from the whole grain, contains more tissue-building material than the bolted meal that is usually sold at the stores, from which the germ has been removed in order to make the meal keep longer. Sometimes the unbolted meal can be bought, but with a small hand mill the best of corn meal can be had right in the home. The mills are not expensive, ranging in price from $1.50 to $5, and the meal can be ground coarse or fine as suits the individual taste.

Corn is likely to take a prominent place in the diet in the future and the numerous ways in which it can be used should not be overlooked. The department of agriculture, Washington, D. C., will send a list of corn meal recipes to anyone who writes for it, and those housekeepers who wish to serve the interests of their home as well as their country should make use of the opportunity.

Canned Vegetables Mean Well-Balanced Ration.

To the Editor:—I note with pleasure that Mrs. J. S. is interested in canning peas and other vegetables for winter use and I am glad to give her the method I have used successfully for the past three years.

Place shelled peas in a bag and put into boiling water. Boil five minutes, remove and plunge into cold water. Pack in jars, fill with boiling water and add one level teaspoonful of salt to each pint. Place rubbers and top partly tightened. Put jars into boiler with tight-fitting cover and false bottom, with water enough to cover jars to a depth of three or four inches, and after reaching the boiling point boil for an hour and a half. Remove and tighten covers and invert to cool.

I got this recipe and others by which I successfully can all vegetables, meats, soups, etc., from O. H. Benson, in charge of canning clubs, Washington, D. C. By these methods we have all the year round an abundant and well-balanced food ration at a very small cost, which has been a great blessing to us.

We, too, live on new land where vegetables do wonderfully well. Besides being a most healthful and profitable exercise it is a great pleasure to me to work among them and see them grow. Mrs. L. H. Curry.

Put Coal Hod on Casters.

One man defines efficiency as orderliness; another as the shortest cut to a given result with the least fatigue. My friend, Mr. New Housekeeper, thinks it is both, and has demonstrated this by putting his coal hod on casters.

With a castered hod, you may avoid the fatigue of lifting when you sweep, since a gentle push with the broom will remove it from your path. Then, too, you do not have to carry it across the kitchen, for a shove with the foot is enough to send it merrily on its way.

MISS LENA F. EAST AND HER OWN PARTICULAR COW, "ROSE."

This new example of kitchen efficiency can be made by screwing a board on to the bottom of the hod and attaching to it universal or ball-bearing casters. If you are a new housekeeper, try it, and see what a source of pleasure this specimen of your housekeeping skill will be to your friends.—[Charlotte A. Baker, Colorado Agricultural College, Fort Collins, Colorado.

To Curl an Ostrich Feather.

An ostrich feather that has lost its fluffiness may be curled again by using a dull knife or some other blunt edge. It is a rather tedious job, however, as each frond must be curled separately. Slip the knife under the frond down close to the quill and with the frond pressed lightly between the edge of the knife and the thumb bring the knife with a quick but steady movement toward the tip of the frond. Do not use a sharp knife, as that will likely break or cut the feather. The back of a case knife is best.

Varnish Good For Linoleum.

To the Editor:—One of our readers has asked about the advisability of varnishing inlaid linoleum and as one who has had experience I must say that varnish does not injure linoleum. On the contrary, it hardens it so that the dirt will not work into it: therefore, it should be varnished immediately after it is put down. Varnished linoleum is easy to keep clean and I would by all means advise this lady to try it. H. E. H.

A New Pie Recipe.

To the Editor:—I am a regular reader of the Home department and as I have tried many good recipes from its columns I am sending one for buttermilk pie that I think is excellent.

Use four eggs, two cupfuls good buttermilk, two scant cupfuls sugar, butter the size of an egg, four tablespoonfuls flour, lemon flavoring. Beat the eggs, add the flour, and beat together well. Then add the sugar, butter, milk and flavoring. This will make two large pies. Have your pie plates lined with good pastry. Bake only with one crust.

Will someone please tell me how to clean lard barrels for pickling and kraut? I have some barrels that I would like to use for this purpose, but I do not know how to clean them, if they can be cleaned at all.

Mrs. M. J. Smith.

Pickles For the Market.

To the Editor:—Last summer I salted down some cucumbers and they are now in brine of their own making. I have been wondering if some of the Home department readers could tell me how to prepare good sweet pickles from these. Can I make them so they will be crisp and tender? What proportions of vinegar and sugar should I use, and what combination of spices should be used to give best results? I would like, if possible, to have them like the sweet gherkins sold in bottles. I want to put them on the market if I can make a salable article.

An Old Subscriber.

Good Luck Canning Vegetables.

To the Editor:—For the last two or three years we have canned peas, beans, corn and asparagus and have had very good luck with them. We use the tin cans mostly, but have used the glass jars.

Hull the peas ready for canning and place them in a flour sack (they are easier handled that way) and put in a boiler or kettle of boiling water and blanch ten minutes. Then place in your jars, add a teaspoonful of salt to each jar and cover with boiling water. Place rubber in place and screw the lid on tightly. Put in a boiler of water with a frame under them and boil two or two and a half hours. Count from the time the water begins to boil. Remove from the boiler and tighten the lids. We put ours in boxes and put them in a dark place.

Joy Bouton.

Pack Lemons in Salt.

To the Editor:—I noticed in the Home department an inquiry about storing lemons for summer use. This is the way I used to store them and the plan always proved satisfactory. The lemons kept fresh and did not spoil.

First take any pail or pan which you think is large enough to hold as many lemons as you wish to store. Then sprinkle a little salt at the bottom. Next put in a row of lemons and cover them with salt. Then another row of lemons, and so on until you have all of your lemons covered. Put them in a cool, dry place. Coarse barrel salt is all right for this purpose.

P. I. Fisher.

Recipes.

Rhubarb Baked With Raisins.—Peel the rhubarb and cut in half-inch slices. For a pound of rhubarb take half a cup of raisins and a cup of sugar. Use seedless raisins. Cover the raisins with boiling water and let cook until the pulp is tender and the water is evaporated to two or three spoonfuls. Sprinkle the rhubarb, raisins and sugar in a baking dish in layers and let cook in the oven or on top of the range until the rhubarb is tender, but not broken. Prunes may be used instead of raisins.

Beet Salad.—To one quart of well-cooked beets, chopped fine, add one quart of finely shredded cabbage, one cupful prepared horseradish, one-half cupful light brown sugar, one level teaspoonful salt. Serve in nests of lettuce, with mayonnaise.

Apple Pudding.—Two cupfuls bread crumbs, one cupful sugar, two cupfuls chopped apples, one-half cupful butter and a little nutmeg. Into a well-buttered pudding dish put a layer of the bread crumbs, then a layer of the chopped apples. Sprinkle with sugar, bits of butter and a grating of nutmeg. Repeat until dish is full, having last layer buttered crumbs. Pour over all one cupful of water. Bake slowly forty-five minutes.

Stuffed Cabbage.—One firm head of cabbage, one-half cupful cooked ham, chopped, one-half cupful bread crumbs, softened with milk, salt, pepper and a little chopped onion. Parboil cabbage and cut out the heart. Mix ham with softened crumbs, add seasonings and fill cabbage, binding it around with a clean strip of cloth. Put bits of butter or ham fat on top and bake about twenty minutes in a hot oven. Parboiled sweet peppers, with seeds removed, or parboiled large onions may be stuffed with same mixture.

Eggs Rolls (three portions).—One cup flour, two level teaspoons baking powder, one-fourth level teaspoon salt, one and one-half level tablespoons lard, four tablespoons milk, one egg, one level teaspoon sugar. Mix and sift the flour, baking powder and salt. Cut in the lard with a knife. Add the milk and the beaten egg yolk, mixing until a soft dough is formed. Pat into a shape one-fourth an inch thick. Cut into oblong pieces two inches by four inches. Beat the egg white stiff and add the sugar. Brush over the tops with this egg mixture. Make two parallel creases across the oblong pieces. Bake ten minutes in a moderate oven.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Drives the Hayfork and Likes It.

Dear Young Folks:—I have never written a letter to you before, but I would like to just the same. I am a girl thirteen years of age and live on a farm of 216 acres. We have two other farms. We have a very large woods and I go there when I want to wade or pick flowers.

In the summer I drive the hayfork and I enjoy it. I most always drive the team on the hay loader too.

I am in the seventh grade at school. I like my teacher fine. She is a good instructor. My brother and sister and I drive to school. My sister is going to graduate from the twelfth grade this year.

We have a seven-passenger Hudson 6. I have many rides in it. My longest ride was eighty-two miles.

I read Marie's story about the red hen. It was fine. —Helen Marie.

Caught Rabbit in Field.

Dear Young Folks:—I am a little boy eight years old and am in the second grade. I like to hear your stories and hope there will be more.

I am going to tell you about a rabbit. Last summer when we were cutting hay, papa, mamma and I were the only ones cutting. We scared up a great many rabbits and I tried to catch them, but, of course, I couldn't catch any. After a while I caught a little rabbit that was only a month or two old. I brought it to the house and put it on the porch and turned it loose. Mamma made me take it back to where I found it. I often think of it now.

—James.

Loves All Her Pets.

Dear Young Folks:—I live on a farm with my uncle and aunt. My parents died when I was very small like Sylvia's parents did, so we are both orphans, aren't we?

I have four pets which I must mention, a chicken, a dog and two cats. I love them all. I have nine dolls. Their names are Freda, Pansy, Ellen, Marguerite, Hazel, Verna, Polly, Kewpie and Sweetie. Aren't those beautiful names? I would like to own a parrot.

Now I shall describe myself. I have brown eyes, light hair, and I am eleven years old. I am in the fifth grade.

—Oleta.

Grandfather Sets Good Example.

Dear Young Folks:—I enjoy your letters very much. This is my first letter. I am a boy eleven years old. I live on a farm of 204 acres. I have a pure-bred Guernsey heifer of which I am very proud. I go to school every day. Our teacher's name is Miss Ruby, and we like her very much.

My grandpa is ninety-four years old. He gets up at four o'clock in the morning and builds the fire and carries in wood and water. He also feeds the chickens. Don't you think that is pretty good? —Llo. .

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to WISCONSIN FARMER, Madison, Wisconsin.

2068—A dainty boudoir sack. Pattern is cut in 4 sizes: Small for 32 and 34 inches bust measure, medium for 36 and 38 inches bust measure, large for 40 and 42 inches bust measure, and extra large for 44 and 46 inches bust measure. The small size requires 1½ yards of 36-inch material.

1721—Girls' dress with sleeve in wrist or elbow length. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3 yards of 44-inch material for an 8-year size.

2094—Some attractive collars and a smart pair of cuffs. Pattern includes all styles illustrated and is cut in 3 sizes: Small, medium and large. No. 1 will require ½ yard; No. 2 collar, ⅝ yard; cuff No. 2, ⅜ yard, and collar No. 3, ⅝ yard of 27-inch material for a small size.

2069—An ideal play suit and comfortable school dress. Pattern is cut in 6 sizes: 2, 4, 6, 8, 10 and 12 years. Size 8 requires 3 yards for the dress and 1⅝ yards for the bloomers, of 44-inch material.

2093—A smart style good for many occasions. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 5⅛ yards of 44-inch material for a 36-inch size.

1670—Costume with sleeve in either of two lengths (for misses and small women). Pattern is cut in 3 sizes: 16, 18 and 20 years. It requires 5½ yards of 36-inch material for an 18-year size.

Waist 2090-Skirt 2079—A smart sports dress. The waist pattern 2090 is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3 yards of 36-inch material for a 38-inch size. Skirt 2079 is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure, and requires 3¼ yards of 44-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

1783—Girls' dress with jacket blouse, and skirt attached to an underwaist. Pattern is cut in 4 sizes; 6, 8, 10 and 12 years. It requires 4½ yards of 36-inch material for a 10-year size. For separate jacket blouse it will require 2 yards of 36-inch material.

2070—Ladies' house dress with reversible closing and sleeve in either of two lengths. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6½ yards of 36-inch material for a 36-inch size.

2072—A charming dress for mother's girl. Pattern is cut in 5 sizes; 4, 6, 8, 10 and 12 years. It requires 4 yards of 36-inch material for an 8-year size.

2077—Boy's rompers with sleeve in either of two lengths. Pattern is cut in 5 sizes: 2, 3, 4, 5 and 6 years. It requires 2⅝ yards of 36-inch material for a 4-year size.

1535—Ladies' overall apron. Pattern is cut in 3 sizes: Small, medium and large. It requires 6¼ yards of 36-inch material for a medium size.

TALBOT 2⅜ in.
TYRONE 2⅛ in.

ARROW FORM-FIT COLLARS

The curve-cut top and band assures perfect sit and fit as well as healthful ease and comfort.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for May 6, 1917.

Jesus the Servant of All.

LESSON TEXT—John 13:1-15.

GOLDEN TEXT—And whosoever of you will be the chiefest, shall be servant of all.—Mk. 10:44.

This lesson is really a continuation of the latter part of the lesson of last week, for the glory of Jesus is his unselfishness whereby he wrought out redemption for mankind.

I. Selfishness Amid Holy Surroundings (vv. 1-11). The world does not appreciate Jesus. It never has. "His own," the Jews, did not appreciate him. We are considering him today as he was about to depart from the world that had despised and rejected him to one that appreciated him (Heb. 1-6). The development. Verse 2 tells of the Satanic suggestion that came to the heart of Judas. In it was personal desire, and, connected with it, human conspiracy. The coming to this upper room has been pointed out by a man bearing a pitcher (Mk. 14:12-16), the pitcher being suggestive of the Holy Spirit which was about to come in the place of the visible Christ, and it is in the midst of such sacred surroundings as this that Satan enters the hearts of students. This is a suggestion as to the power of environment. Environment is an aid, but it does not produce effective safety. No moment is too holy for Satanic suggestion. Jesus knew that the hour was come when he was to depart out of the world. "Having loved his own, he loved them to the end." Even though the Father had given all things into his hands, still it was necessary for him to teach the disciples once more, and finally, the lesson of humanity. He knew and remembered the strife among the disciples (Luke 22:24-28). Doctor Bonard's famous dream, analyzing zeal as being made up of ambition, pride and elements other than the love of God is worthy of consideration in this connection. We need to realize the danger of selfishness even in our service for God. Have we examined our motives? If the consequences of our superiority, either of rank or ability, tempts us to shirk the lowliest of services, it is time for God's children to recall this scene, and remember that "the servant is not greater than his Lord." Peter's strong protest (v. 8) brings out the fact that the washing by Christ of the disciples' feet was deeper than merely the outward application of water (See Rom. 8:9).

II. Service, the Evidence of Divine Humility (vv. 12-15). (1) This service was tender. Jesus had all things (v. 3), yet he became the servant of all. (2) It was for all. All need a washing. All the disciples needed to learn, and all servants must learn, to obey. (3) It signified sanctification. We are saved once for all, but we are constantly being stained by our contact with sin in the world; hence the need of renewed cleansing. New light reveals new need of cleansing. (4) It signified deity. Jesus read the thoughts of his disciples. He became their servant that in years to come they might know the meaning of service. He became their example, and in years to come they remembered his knowledge and service. (6) It was for "his own." The disciples did not know what it was he had done to them. Little do we understand oftentimes what it is the Lord has done to us. Jesus set them an example whereby he would remove the dirt of crime, self-seeking and every manifestation of selfishness from their sin-stained souls. We may call Jesus Lord and Master and it is well that we do so, for Master and Lord he is indeed, but, if we call him so, let us not do aught than make him in our lives what we call him with our lips. The idea here emphasized has given rise to much religious literature. "The Imitation of Christ" by Thomas a'Kempis, is the most popular book in the world next to the Bible.

"Verily, verily I say unto you" (v. 16). This introduction shows how important Christ considered his teaching at this point. "The servant is not greater than his Lord" (See Matt. 10: 24; Luke 6:40; 22-27). If the Lord bent to this lowly service, certainly they, the servants, should not think it beneath them to do likewise, nor should the one that is sent (an apostle) consider himself greater than he that sent him. John, who wrote this epistle, was one of the apostles guilty of an unholy strife for power and position, and desirous of bringing fire down upon those who did not acknowledge and follow Jesus, but he became a marvel of love and tenderness.

Knowing and doing are the twin pillars of the Christian faith upon which the house of happiness is built. Such service is not egotistical.

If we seek to do service for others, then we have the right to call Jesus Master and Lord, but if we seek honor rather than to be humbly useful, we shall have no right to call him thus.

This instance made a deep impression upon Peter, as can be seen from the striking illusion in his first epistle (I Pet. 5:5 R. V.)

Free To Boys

I Have a Glove, Mitt, Mask, Ball, Bat Cap and Belt for Every Boy Who Will Write to Me.

There are seven splendid pieces in this great outfit. The ash bat is a good one. The mask is made of heavy wire, full size. The catcher's mitt is thickly padded, very heavy and has patented fastener. The glove is of tanned leather and has patent clasp. The ball is strongly stitched and will last. A neat, adjustable belt and a dandy cap complete this great outfit. Remember you get the whole outfit of seven pieces for a little easy work. Write me to-day and I will tell you just how to get it.

A. M. PIPER, 50 Popular Bldg., Des Moines, Ia.

VETERINARY

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

Ailing Animals.

"Blind Staggers."

I have a brood sow that has blind staggers. I have been feeding her buttermilk and corn and she has been following the cattle in the yard. Will you please tell me the cause of this and give me a remedy for it? I have this sow shut off by herself now and am feeding her sweet separated milk and oats.

This trouble may come from being infested with worms or may come from some trouble within the brain itself. Give nothing but milk for three or four feeds and give a dessertspoonful of oil of turpentine in each feed of milk and you may get results.

Contracted Tendons.

I bought a large black colt, coming four wears old, a while ago. The man I bought him from said he hurt himself running in the pasture a year ago last summer. He knuckles forward a little on his right front ankle when he steps on it. He doesn't favor it except after he has been running and playing a good deal. The man I bought him of said his left foot was the worst at first and that the right one got that way by favoring the left one. The left one is all right now. Please advise me what to do for him. I haven't done much for him yet, except to put on a little liniment, and used a stiff boot on it for a short time.

There is some contraction of the flexor tendon in this case. Treatment should not be attempted in these cases without the assistance of some one familiar with such cases. Some good may come from line firing the tendons, but this should be done by a veterinarian. Severing the tendon may prove beneficial.

Breeding to Immune Male Hog.

I am having serious trouble with my hogs and would like your advice. Is an immune hog considered healthy to breed to female hogs that are not immuned? I have bred twenty sows weighing from 200 to 300 pounds that were in good condition. The male had been immuned two or three months before placed in the pens. The pigs come unhealthy and without life, over half being born dead. Would like to know what you think is the trouble.

The fact that the male hog was an immuned hog has had nothing whatever to do with your pig trouble. You will have to look further than that, because there is no connection between the cholera immunity and the dead pigs.

Digestive Disturbance.

My pigs are dying off in a way I cannot account for. Would you please advise me how to treat them and what causes the disease? When they are about two or three days old their tails become red, they wander about the pen, wabbling and gritting their teeth. They get thin and dizzy like, and seem to be hungry and bite at everything they meet. The sows are in good, healthy condition, fairly fat and seem to have milk. I feed the sows on corn and water.

Your pigs are probably victims of digestive disturbances. There is in all probability some weakness of the pigs even at the time they are farrowed. Change the mothers' feed gradually, giving some oats and slop containing some shorts or middlings. See that the pigs have good, clean, dry quarters and your trouble may cease.

Retained Afterbirth.

I have a four-year-old Short-horn cow that dropped a calf about three weeks ago and did not clean at the proper time. She has a discharge of a bad odor at times. I feed her shredded fodder, cane, hay and a little corn. She is falling away in flesh.

A cow should never be neglected in this way, as the price paid for having her attended to is small compared to the injury done her from neglect. This animal's womb should be injected with a warm, clean water solution containing 1 per cent lysol or 1 to 5,000 permanganate of potash. This is to be done daily for a few days and by means of a long rubber tube and a funnel, the tube being inserted into the womb and the funnel attached to the other end. The fluid is best asperated after being in the womb awhile.

Farm Run By Wind Power.

(Continued from page 1.)

good work, even in high winds. Some windmills are noted for quitting work in high wind; is it any wonder some people have such poor opinion of windmills?

"The electric starter on automobiles is very similar to batteries charged by a windmill, the variable speed of the car being like the variable speed of the mill.

"Farmers, as a rule, are wary of electricity, fearing they cannot make it work. I did not know volts from amperes when I bought my lighting plant. When I got into the work I found everything worked out in a very simple manner. If we belt up a feed grinder we have to run it in the right direction. A dynamo also has to be run in the right direction. It is right and left-handed; that is, it has positive and negative wires the same as storage batteries, which are right and left-handed, called positive and negative poles. As an example, if a battery of men should take hold of hands, each man would represent two volts of pressure; fifteen cells would represent thirty volts' pressure. However, an additional cell is added to it for good measure.

"Amperes represent the amount of current flowing out of the battery. Watts are measurements and equal volts times amperes. Electric lamps are rated by the number of watts they consume. A horse power requires 746 watts.

"A cut-in is an instrument which keeps the current from flowing back from the battery into the generator and being wasted, the same as a check valve is in a water pipe.

"The hydrometer is an instrument which registers the state of charge. This will rise to a certain mark when the battery is fully charged and will settle as the current is being used.

"Batteries in glass jars are much preferred, as one can see the condition of the plates and the amount of sediment.

"The Electric Farm also has its wireless telegraph set, and was capable of receiving time and other messages sent out by the government stations and others. Since war has been declared, this has been dismantled by order of the government, the same as all amateur wireless sets."

Is it any wonder, in view of such utility, that both Mr. and Mrs. Forrest should be enthusiastic over the possibilities of electric power on the farm, or that they should proudly call their place The Electric Farm, printing a picture of windmill and powerhouse, with the adjacent barns and outbuildings, on their farm stationery?

Farming has passed the day and age when brawn alone sufficed, and has reached that stage when it is most successful when prosecuted by men who put the most brains into all of its operations. Mr. Forrest is a prosperous and successful farmer and has to thank the fact that his mind welcomes new ideas, and executes them, for the success and the prosperity which he has so notably achieved.

Canada Offers 160 Acres Land Free to Farm Hands

Bonus of Western Canada Land to Men Who Assist in Maintaining Needed Grain Production

The demand for farm labor in Canada is so great that as an inducement to secure at once the necessary help required, Canada will **give one hundred and sixty acres of land free as a homestead** and allow the farm laborer, who files on land, to apply the time he is working for other farmers as residence duties the same as if he had lived on the land he had applied for. This offer made onl yto men working on Canadian farms for at least 6 months during 1917, thus reducing the necessity of actual residence to 2 years instead of 3 years, as under usual conditions. This appeal for farm help is no way connected with enlistment for military service, but solely to secure farm laborers to increase agricultural output. A wonderful opportunity to earn good wages while securing a farm. Canadian Government will pay all far over one-cent per mile from St. Paul and Duluth to Canadian destination. Information as to low railway rates, etc., may be had on application to

GEORGE A. HALL
Canadian Government Agent

WANTED to hear from owner of farm for sale or exchange. Kubat Realty Co., Chippowa Falls, Wis.

STOP! Listen! 80-acre creek farm, $750; terms; free list. McGrath, Mountain View, Mo.

Are Your Hogs Lousy?

Now, let me tell you an easy, economical and effective way to rid your hogs of lice, and at the same time destroy the disease germs that may be lurking around the place. It's natural for a hog to wallow. Provide your hogs with a wallow close to the feeding grounds, to which add

Dr. Hess Dip and Disinfectant

Your hogs will be constantly passing back and forth from the wallow to the feed trough. While the Dip will kill the lice and cleanse the skin, the drip will destroy the germs of disease and the worms that pollute the ground.

One gallon makes 70 to 100 gallons of solution, ready to use. My Dip, being not only a dip but a powerful disinfectant as well, saves you the expense of buying two preparations.

Consignments at Plymouth Sale.

AT the Plymouth, Wis., Holstein sale, May 15th, John Melins, of Adell, Wis., is consigning 12 head. Several of the females will be bred to his 34-pound sire. Mr. Melins is including in this consignment a two-year-old son of this 34-pound bull out of the best cow in his herd. A bull calf by this young bull out of one of the best cows in the herd will also be consigned. Truttschel Bros., Sheboygan Falls, Wis., are consigning three head. One of the animals of particular note is a 29½-pound bull calf sired by their 33-pound herd bull. The dam of this calf is a big, fine cow, typical of the Truttschel Bros. herd. Their entire list of A. R. O. cows, including two two year olds, average practically 27 pounds. R. C. Stolper, Random Lake, Wis., is consigning 16 head to this sale. In this consignment we find a number of mature cows in their prime that are exceptionally good individuals. Mr. Stolper also has a two-year-old grandson of King Segis Pontiac and sired by King Segis Pontiac Polkadot, a full brother in breeding to the $50,000 bull, King Segis Pontiac Alcartra. Struve Bros., Plymouth, Wis., are consigning three heifer calves and one yearling heifer. Three of this number are sired by their 28-pound bull and are out of exceptionally heavy milking dams. Dinah Johanna Abbekirk 2d has a record of 28.71 pounds in seven days and 677.45 pounds in 300 days. See advertisement of this sale on page 20.—Adv.

Grow Your Own Herd Bull.

JUST at the present time, Holstein bulls of serviceable age are very scarce and those that are advertising bull calves are having no difficulty in disposing of them. By buying your bulls when they are young you have the chance to grow them out to your own liking. Geo. A. Wilson, Neillsville, Wis., has a herd of good working Holsteins—big framey cows that are giving from 40 to 60 pounds milk a day, and at this time Mr. Wilson has several young bulls out of these good cows for sale. They are sired by Plain View Sir Johanna Clothilde whose dam gave 461.1 pounds milk and 23.19 pounds butter in seven days. These good bulls that are offered are just a little more white than black and are right in every way. They are well bred and the price is reasonable. Write for further description and please mention The Wisconsin Farmer.—Adv.

The Splendid Performance of Elm Court Johanna 2d.

THE Elm Court Farm, Briggsville, Wis., has produced and developed a Holstein heifer that now stands second in the amount of milk produced and fourth in the amount of butter in seven days of all cattle ever tested in the state of Wisconsin under two and one-half years of age. Elm Court Johanna Pearl 2d freshened at the age of two years four months and 15 days and in seven days produced 488.1 pounds of milk, testing 3.82 per cent, making 23.286 pounds of butter. The heifer's sire's dam has a seven-day record of 31 pounds as a full-aged cow and a yearly record of 1,146 pounds of butter, which shows the line of breeding from which she comes.—Adv.

Bryan Short-horns.

A. C. BRYAN, of Red Wing, Minn., has one of the best working herds in that part of the state. Most of his cattle are of the best Scotch breeding. About 125 head comprise the herd headed by two very good bulls. One, Village Cumberland, is a remarkable sire. We saw 30 calves by him and it has been some time since we saw that many calves by one sire that have so much breed character and uniformity as those by Village Cumberland. He is one of the few bulls in the Northwest out of a daughter of Cumberland's Last. The other bull in service is a son of Village Baronet, out of a Hopeful Archer dam. He is a good sort of a two year old and should cross well on the Village Cumberland heifers. Mr. Bryan will hold a sale in October at which time he expects to sell about 50 head of choice cows and heifers.—Adv.

Shimming & Stroebel's Consignment at the Lake Mills Holstein Sale.

MR. SHIMMING and Mr. Stroebel are consigning some choice heifers sired by Uneeda Korndyke Abigail Boy, a 33-pound bull that is out of the best daughter of Johanna McKinley Segis. These heifers are especially good individuals, well grown and out of A. R. O. dams. Part of this consignment is bred to a 34½-pound sire, which makes the consignment one that is worthy of the closest inspection for discriminating buyers.—Adv.

W. J. DANE, proprietor of the Dane Stock Farm, Oshkosh, Wis., reports that he has sold the balance of his Hampshire sheep as a foundation flock which have been shipped to Bartlesville, Okla. Mr. Dane also states that in view of the fact that he has rented his farm he is offering for sale tried Hampshire brood sows and fall gilts, which he had formerly intended to keep. It will be remembered that Hampshire sows make their good cross on grade sows for market hogs and those interested will do well to get in touch with Mr. Dane.—Adv.

Notes From Swine Breeders.

WE have recently visited some of the pure-bred swine breeders in the southern part of Wisconsin and while most of them have not succeeded in raising as many early pigs as they would like, the young pigs that we saw were doing nicely. We feel that the breeders are going to have a good lot of stuff to offer the buyers in due time. In the first place feed is exceptionally high and a "hog man" realizes that it does not pay to buy high-priced middlings, tankage corn and oats and feed it to inferior pigs, for that reason we expect to find the herds culled closely and only the good ones retained for the trade. Our trip was made the early part of April and the following figures were on pigs farrowed at that time, of course many of the breeders have pigs come through April.

DOBSON & EASTMAN, Lancaster, Wis., had 50 odd pigs and Burley Dobson thinks he has the best bunch, numbers considered, he has had for some time. The have some good pigs by the Big Ben boar purchased in Illinois. Others are by a yearling of their own breeding and he is some boar—he can be seen at the fairs this fall.—Adv.

FRANK MOREHOUSE, Lancaster, Wis., had the biggest bunch we saw, about 125 spring pigs out of 160 farrowed. Frank is one of the best hog men in Grant county and he is not afraid to buy feed for his hogs, but at that he thinks this number sufficient to feed this year. Most of them are by a son of Big Ben and a Jim Crow boar, both good boars and their get looks good. It is very likely Morehouse will have a herd at Milwaukee this fall.—Adv.

W. F. ACKERMAN, Glen Haven, Wis., has had excellent success this spring, having 65 pigs, an average of eight pigs to the sow saved. They are a uniform lot, all farrowed about the same time and being by A.'s Big Orange, they have the popular breeding. Mr. Ackerman has a young boar, farrowed last fall, sired by Percy Young's Orange Wonder and out of a Master's Giant dam. He is a very likely boar and with the care he will receive at the hands of Mr. Ackerman, he should develop into quite a likely herd boar.—Adv.

FRANK RENALDE, Lancaster, Wis., does not keep as many sows as some breeders, but what he has he has good and the 40 pigs he has compare favorably with any we saw. They are of big-type breeding sired by several different boars.—Adv.

ED HENDRICKS, Hazel Green, Wis., had 85 pigs from 12 sows farrowed at that time. Ed has every reason to be proud of his spring crop, for they are good with very few runts. Those sired by Model Major 2d, out of Black Jumbo dams are choice, with great stretch and size. He has two litters by Big Bob out of Long Big Bone dams. One litter each by Big Joe 2d and Blue Valley Jr. He is not certain yet whether he will hold a boar sale this fall or not.—Adv.

JOHN L. FISHER, Janesville, Wis., has around 100 spring pigs, most of which are by the grand champion, King Defender out of his richly-bred sows. He also has a fine litter by Cherry Chief Wonder and one litter by Oakland Orion Cherry King. Fisher has some promising pigs to offer at weaning time.—Adv.

RUNDE BROS., Cuba City, Wis., a recent addition to the Duroc Jersey ranks have about 40 pigs. Some of them are sired by a very good son of Prince Illustrator and they have one good litter by Burke, a son of the champion, Burke's Good Enuff. Another good litter is by the noted Grand Model. They have recently purchased a fall boar sired by Walt's Top Col. out of an Orion Cherry King dam that looks like a comer. He is of the very best breeding and we believe that he has a future. Keep your eye on this herd of Durocs.—Adv.

JAS. FISHER, Eastman, Wis., has 160 pigs and no breeder has his pigs doing better than Mr. Fisher. He said that he has had very little loss this spring and has better than an eight pig average. At the present time this breeder has most of his pigs sold for June shipment. He ships at weaning time and no man in the business sells as many Chester Whites in the Northwest as Mr. Fisher. Last year he sold 260 head for breeding purposes.—Adv.

J. C. HENDRICKS, Hazel Green, Wis., also has about 85 pigs sired by a dozen different boars, although the pigs of his own breeding are the toppers at the present time.—Adv.

CHARLIE FLESCH, Mt. Ida, Wis., has a dandy bunch of about 40 and he has some of the best pigs we saw on the trip. Most of them are by Big Mint and you fellow that think you have a big yearling, should see this boar. He is the biggest boar of his age that we have seen this spring and he will be "some boar" by Milwaukee time.—Adv.

E. H. PARKER & SON, Janesville, Wis., have about 75 pigs most of which are of their own breeding. King Orion. their great herd boar has done a good job on this farm and the litter by him are outstanding. Others by the Chief's Col boar are also good. Their sows purchased in the East had not farrowed at the time we were there.—Adv.

NEXT WEEK'S SALE PROGRAM

Tuesday, May 8	Holsteins, Lake Mills Holstein Breeders' Consignment sale, Lake Mills, Wisconsin, F. H. Everson, Mgr.
Wednesday, May 9	Holsteins, Lake Mills Holstein Breeders' Consignment sale, Lake Mills, Wisconsin, F. H. Everson, Mgr.

Hereford Cattle.

May 18, Birch & Thompson, Lake Geneva, Wis.

Fond du Lac Holstein-Friesian Breeders' Sale.

The Fond du Lac Holstein-Friesian Breeders' Association Sale, April 26th and 27th, was a complete success, one which will undoubtedly establish Fond du Lac in the Holstein world as a place where annual sales of this character will be staged in the future. The building of a sale pavilion, ample for the accommodation of such events, is now practically a certainty. The sale was remarkable for the smoothness with which it was run and too much credit cannot be given S. H. Bird, sale manager, who reports that he did not encounter the slightest friction with the various consignors. The results of the sale, therefore, is further evidence of the value of loyal and whole-hearted coöperation in conducting a consignment sale. Mr. F. J. Bristol's consignment was, of course, the big feature of the sale and particularly the selling of his noted 31-pound cow, Johanna Korndyke Butter Girl. It is seldom that enthusiasm reaches the pitch in a sale that was shown when Johanna Korndyke Butter Girl was hanging between the $1,800 and $2,100 mark. Mr. Geo. J. Schuster, of Mukwonago, Wis., certainly made a royal acquisition to his already well-known herd by purchasing this splendid cow for $2,100 that promises such a brilliant future. Two of her sons are now in use in Mr. Bristol's herd which bespeaks his opinion of her merit. Mr. Bristol's entire consignment of 49 head sold well. Mr. Bird also consigned some splendid foundation stock that in no small measure contributed to the dignity of the sale. The other consignments were for the most part well fitted and in a commendable condition to enter the sale ring. The leading Wisconsin buyers were as follows: Geo. J. Schuster, Florence Stock Farm, Clovis Ctock Farm, Imig Bros., J. E. Barstow, Bein Bros., Homer R. Dopp, Carl J. Tremain and the John Finnigan Est. The total number of 138 head brought $35,755, averaging $261. The following is a list of sales:

BULLS.

Sir Piebe Aaggie Hengerveld 5th, March 25, 1913; F. O. Louden, Oregon, Ill. $130
No. 5, Dec. 5, 1916; S. H. Bird, So. Byron, Wis. 75

Wisconsin Farmers' Clubs.

(Continued from page 5.)

ing one for everyone. We haven't this year's report yet, but expect it at our next meeting. We have the last year's report and if you wish I will send both together as soon as it is made out.

Sauk Co., Wis. Mrs. Alta Miller.

[Editor's Note.—You ought to have one good social meeting every six weeks at the home of some member and a picnic in the summer time. I know that you have the federation picnic at Devil's Lake each year, but why not a special one of your own at some time when most of the members can get away. Many of our clubs are talking about such subjects as cow-testing associations, examination of soils, farm management and keeping books on the farm business, taxation, condition of the rural schools as to grounds and comforts of the children, etc. Several clubs have become successful from having some special object or aim to work for. For instance, a good object is to fix up the school grounds and buildings. Another is to put the cemetery grounds in shape. Another is to organize road dragging and distribute the work among the members so that each can do his share. These are only suggestions. I know of one club which had as its summer object keeping the roadsides mowed down and free of weeds. It helped the looks of things in that neighborhood a lot too. As a special program for the near future let me suggest a loyalty meeting. Get some good man to give you a patriotic address. Let the children sing patriotic songs, and the old folks, too, for that

PINE RIVER CLUB, WAUSHARA COUNTY, MEETS HERE.

matter. The Wisconsin Farmer will furnish copies of America (the words) to any club free. Write to The Wisconsin Farmer, Madison, Wis., and ask for them.]

Chippewa County Literary Club.

To the Editor:—I am sorry to state that the work of our Halliette Literary Society has been allowed to go by default during the past winter. I was appointed supervisor and teacher this year and have not been able to do any special work in any one vicinity. In my work this year, especially at the social meetings I attended in the rural communities, I discussed the merits of rural clubs and urged their organization. Next year I hope to help with the organization of more clubs, because I realize the results which may be accomplished when they are properly handled. We had a fine club last year. In my judgment a part of the work of the supervisor and teacher should be community work.

Alvin Carew.

Greatest Potato Offer.

Don't miss the wonderful extra-early "Six Weeks Potatoes." None on earth can compare. Now is your time. I will send true seed for 10 big hills and add 50 cents worth of the finest vegetable and flower seeds to introduce, all for **two dimes** or 24 cents in stamps. 30 hills and the seeds for 50 cents; 70 hills and seeds, $1. More, same rate. Don't delay. Please tell everybody. **A. G. Cook (Potato Specialist) Hyde Park, N. Y.**—Adv.

The Lake Mills HOLSTEIN SALE

MAY 8 and 9

Lake Mills is known as the place where dependable Holsteins can be bought.

THE sale company offers in this sale 175 head of good, desirable animals, tuberculin tested and of the most popular breeding. They offer A. R. O. cows that would be hard to beat, sired by sons of Pontiac Aaggie Korndyke and Beauty Pietertje, and bred to a son of Friend Pontiac Korndyke, that is from a 31.65-lb. daughter of King Segis. 18 A. R. O. cows, two with 24 pounds, one with 22 pounds, several 20-lb. cows, one bred to a 30-lb. son of Johanna McKinley Segis, daughters of 24-lb. cows bred to Rag Apple Pontiac.

Daughters of Canary Homestead Oak De Kol, Canary Fobes Bessie Homestead, King Segis Pontiac Polkadot, Juliana King of Rock, Duke Johanna Inka, Crescent Beauty Segis Pontiac, and the 33-lb. bull, Uneeda Korndyke Abigail Boy.

Heifers bred to Juliana King Repeater, Longfield Paul Fobes Homestead, Winsor Homestead Oak De Kol, King Genevra Colantha Pontiac and the 34 1-2 pound bull, M. M. Lilith Ormsby Fobes.

A few bulls of exceptional merit, sons and grandsons of King Segis Pontiac. One sired by King Beets Lyons and from Mary Segis Beets, 28.26-lbs. at 3 years; several sons of King Segis Pontiac Polkadot; one from a 24.64-lb. daughter of Johanna Mckinley Segis, two sons of Juliana King Repeater, whose three nearest dams average over 1,000-lbs. butter for the year; a son of King Segis Pontiac and from Mutual Lilith of Rock, that is now on test and that made 29.125 pounds the first 7 days; and last, but not least, the sire, Richland Pontiac Butter Boy, a 32-lb. bull.

Tulloch & Fries Consignment

WE have consigned 10 females of exceptional breeding and individual merit, all with good A. R. O. records or with good A .R. O. backing. Also the great young sire and show bull, RICHMOND PONTIAC BUTTER BOY 153981, his dam a 31.76-lb. junior 4-year-old daughter of a 27-lb. cow; his sire combining in the closest possible degree the blood of De Kol 2d, Belle Korndyke and Rag Apple's Clothilde Artis. He is ready for heavy service. Also a yearling bull whose nine (9) nearest dams average nearly 30 lbs., including the junior 2-year-old record of his dam, who will increase her record. Another youngster from a 24-lb. dam, a seven-eighths brother in blood to King Joh, the $7,000.00 bull. He is good enough to head any herd. Mention The Wisconsin Farmer when writing.

Tulloch & Fries - - - - - - - - Genoa, Wis.

W. H. S. Rhoda, 610 3d St., Watertown, Wis.

Purebred Registered
HOLSTEIN CATTLE

In terms of dollars and cents the Holsteins are talking most effectively for themselves. Purebred Holstein cattle are the choice of every public institution or organization which attempts to produce milk in a scientific manner. Just ask a man who owns Holsteins, if you want to hear a story of prosperity. Every angle of Holstein superiority is fully covered in the books and pamphlets which are sent free for the asking. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklet.

Guaranteed Powerful Staude Mak-a-Tractor

Add the Value of 20 Acres to Your Farm—Do Your Farm Work at Half Your Present Cost

This is what the Staude Mak-a-Tractor is now doing for farmers all over the country and can do for you.

Staude Mak-a-Tractor fits any Ford Touring Car or Roadster—the conversion from pleasure car to tractor can be made in twenty minutes and changed back to touring car or roadster in twenty minutes.

And Staude Mak-a-Tractor attachment includes the wonderfully efficient Staude tractor radiator, six times as efficient as the Ford radiator; and a highly perfected force feed oiling system that eliminates lubrication difficulties.

The Staude Mak-a-Tractor is guaranteed to do the work of four horses and do it on high gear. It has demonstrated its ability to plow seven acres a day while horses are plowing but four. It will do every other type of farm work for you with equal saving in time and money.

Four-Horse Work Twenty-Four Hours a Day

You can work the Staude Mak-a-Tractor twenty-four hours a day, plowing two to three times the acreage that you can plow with your best team of four horses, doing the work better and cheaper.

In all your farm work, in all kinds of weather, the Staude relieves you of much worry and expense, cuts your cost in half and increases your working capacity. Increased capacity means increased production, which is the equivalent to having more acreage.

Put this Money in Your Pocket

Cost for feeding and stabling three horses—cost of labor—two days out of every five—cost of man to run plow—your boy can run Staude Mak-a-Tractor.

Value of crops raised on 20 acres released to you by each Staude Mak-a-Tractor.

Two hours out of every four you now take driving to town and back.

Staude with Fifth Wheel Attachment will do your hauling for you.

Staude Will Save It for You

Demand These Features

Special Staude Tractor Radiator—without it you will burn your Ford motor up the first day you use it for a tractor. Without it your water would steam in 20 minutes.

Special Patented Force Feed Oiling System—without it scored cylinders, burned-out bearings are certain. Staude down-thrust drive with tractor axle back of driving pinion—without it you waste power and put a heavy, excessive load on your Ford.

Staude proved ease of installation—any boy can make the conversion.

Staude Gives Them

We Are Making Deliveries Now

You need your tractor now. Our enormous production facilities, big dealer organization, well-organized effort, enable us to put Staude Mak-a-Tractor into your hands immediately. Send your order in today.

THE WISCONSIN FARMER

VOL. XLVI. NO. 19. THURSD WHOLE NO. 1841

Reading Room Urbana Ill.

ON MATH MICHELS' FARM.

President of Wisconsin Dairymen's Association by Use of Alfalfa Has Built Up a Fine Dairy Farm From Once Weed-Ridden Land.

IT TAKES nerve to buy a farm which has the reputation of being the most thickly infested weed plantation of a community, but this is just what Math Michels, of Fond du Lac county, did when he purchased his farm of 178 acres near Peebles, in 1909. What is more, he bought the farm with both eyes open and fully aware of the awful shape it was in. An examination of the fields showed that the Canada thistle had first claim on the fertility of the farm. Mr. Michels was confident, however, that he had the remedy against this pest, and so it has proved. Today the farm shows few places where weeds of any kind can boast a foothold. Alfalfa was the medium through which Mr. Michels successfully overcame the Canada thistle. After carefully preparing a seed bed by properly plowing, disking and harrowing the soil, alfalfa was seeded in combination with barley as a nurse crop. The barley and alfalfa growing rapidly had the jump on the thistle roots, which had not recovered from the thorough cultivation. The growing plants shaded the ground so that the shoots from the thistle had little show to develop to any extent. It is from the leaves that the nourishment must come for the roots, and this source having been practically eliminated, it was only a question of time before the thistles were smothered. During the first year, and especially the first cutting, quite a few thistles were present in the hay, but outside of making the crop mean to handle, they had no effect on the value of the hay for the stock. Within three years' time the thistles on the field had been entirely eliminated.

When Mr. Michels decided to use alfalfa to overcome the thistles he had his mind made up what to do with the alfalfa. One of the first things he did was to purchase a number of Guernsey cows. The combination of enterprise, Guernseys and alfalfa, resulted in the title of Guernfalfa Farm, selected as the name for the farm.

Mr. Michels has been a dairyman for more than thirty years. More than a quarter century of his life, however, was spent in the manufacturing end. He was one of the first students to be graduated from the dairy short course at the University of Wisconsin, and went from Madison to Vermont as instructor in dairying at the Vermont Agricultural College. He later worked in a similar capacity at the Massachusetts Agricultural College, coming from there to Wisconsin. For about twenty-five years he operated his own creameries and cheese factories in Fond du Lac and Calumet counties. He has been active in the buttermakers' association of this state and a member of the national association. His long-cherished desire for a farm, however, finally ended in the purchase of the present place.

After his first success in eradicating weeds from the farm, Mr. Michels turned his attention to cutting down the feed cost in the production of milk. After carefully investigating the feeding values of farm grains and grasses, he came to the conclusion that the feeds he was looking for had been at his disposal for a good many years without his realizing it. Corn silage and alfalfa form the complete ration for his cows today. They receive no other concentrates or feeds. The most peculiar fact is that his cows are yielding him a large profit on this economical ration. Last year his average profit per cow for cream alone was $112. Besides this he has the skim milk and the calves. His total expense for feed was a little over $50, which was used to purchase oil meal. The cows are fed silage twice a day and alfalfa three and four times a day, as much as they will eat. What the cows do not consume of the alfalfa the horses receive, as peculiarly, the horses prefer the stems of the alfalfa while the cows would rather eat the leaves. The herd boasts no animals with phenomenal records, but each heifer must earn her place by producing under farm conditions a profitable yield of milk and fats. The cows are tested for advanced registry, and results show that the production so far has been in excess of the requirements set by the Guernsey association. Most animals have exceeded the standard by at least 100 pounds of fat. Mr. Michels is of the opinion that this simple feeding has resulted in increased health in all his animals. There have been no cases of abortion, calf scours, tuberculosis, or any other disease on the place. Every animal two years old drops a nice calf and continues to do so without fail each year after that.

ADVANCE REGISTRY GUERNSEY, 400 POUNDS OF FAT AT THREE YEARS OF AGE.

ANOTHER ADVANCED REGISTRY GUERNSEY, 500 POUNDS OF FAT AT FIVE YEARS OF AGE.

ADVANCE REGISTRY GUERNSEY, 400 POUNDS OF FAT AT FOUR YEARS OF AGE.

Although the animals receive alfalfa practically the year around, it is never the same alfalfa from day to day. Each day a different cutting of alfalfa is fed, in order to give the cows the variety which animals all crave. In cutting and curing his alfalfa, Mr. Michels follows a system of his own. He cures the bulk of his crop in his large mow. As soon as the crop has been cut and the sun has had a chance to wilt the top leaves, it is raked into windrows and, after a few hours, loaded and put into the barn. In putting this hay into the barn, it is never raised higher than necessary in order to pass into the mow. Instead of a sling being dropped from the top of a track and settling in an unmanageable mass, it is just dropped in a loose shape, so that it can be spread over the mow in even layers. These are about six feet in depth and allow for the hay to heat to considerable extent without causing spontaneous combustion. Much of the hay is discolored through this heating process, but Mr. Michels finds that there is developed in just such hay something which makes it more palatable and higher producing than other hay. He feeds this discolored hay to his test cows, which do especially well on it. All cuttings are kept sep[illegible] that when the hay is fed, different cut[illegible] be used at any time it is desired.

GUERNFALFA FARM, OWNED AND MANAGED BY MATH MICHELS, FOND DU LAC COUNTY, WISCONSIN.

In feeding the silag[illegible] is carefully limited to twenty-five p[illegible] day, and the

(Concluded [illegible])

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

War and the Tractor.

The pen has been mightier than the sword, but this year it is the plowshare. It is generally conceded that the war is to be won b[illegible] an farmer. Article aft[illegible] appeared telling wh[illegible] and how to plant it. a[illegible] the farmer the dire necessity of increased acreage for all the food crops. Various means of accomplishing this result have been suggested, such as mobilizing schoolboys and retired farmers for farm work. While such ideas are good, they lose sight of the fact that production should be increased not by increasing the number of men employed in farm work, as men are scarce in all the trades, but by increasing the amount produced by one man on the farm. A man with only a hoe will not produce much. A man with a plow and a team of horses will make a much better showing. He has more machinery to help him. The difference is not as great as it seems at first, however, as the hoe does not eat. The team will consume the profits off of ten acres. There is just one real solution to the increased production problem, and that is the farm tractor. The tractor enables one man to produce more than two men and many horses could otherwise produce. The tractor does not eat when not at work, and at no time does it consume the food products of the nation. It requires no rest. It is ready for duty night and day. It plows the ground deeply. It plants the crops quickly. And it is there when it comes to the harvest. It is our surest means of increasing production.

Unfortunately, the number of tractors to be had at present is rather limited, though all tractor manufacturers are taking steps to greatly increase their production. We suggest that all farmers who own tractors keep their machines running night and day, as they are now doing in England. If the owner of the tractor has not enough work for it, possibly his neighbors could make use of it to advantage, a fair price being charged for the service. Foreign governments are fully alive to the possibilities of the tractor as a means of saving labor and increasing production. One foreign government recently offered to place a single order for 1,000 light farm tractors. The entire order was not accepted, as the manufacturer wished to favor our own farmers.

Questions and Answers.

Moth Balls in Gasoline.

Being informed by various magazines that moth balls may be used in gasoline as fuel in an automobile engine to increase its power, I am asking you to inform me whether this is injurious to the motor in any way.

Answer.—A moderate use of moth balls should not injure the motor in any way. The only possible harm likely to result would be from the increased wear on the engine, due to the increased force of the explosion.

Engine Does Not Run.

I have a two and one-half horse-power two-cycle boat motor that has stood for some time without running. Now I have cleaned it out and put in new packing, but it will not run. It has good compression. It has the Lunkenheimer carburetor. I have tried to run it with a motorcycle coil. Do you think that a vibrator coil would be better? It fires a little when the spark is fully retarded.

Answer.—Use a vibrator coil if you have a jump spark. Use a plain coil if you have a make-and-break spark. Test the spark plug or igniter outside the cylinder to see that you have a good spark. If the spark is all right, test the timing of the spark. When in fully retarded position the spark should occur soon after the piston passes top dead center. With good compression and a good spark properly timed, the only other chance for trouble is the fuel mixture. Vary this to obtain the correct one. Make the mixture too rich; then shut off the fuel supply and crank the motor till it starts. Quickly turn on and adjust the needle valve while the motor is running.

Gears Worn Out.

We have a 1914 model Studebaker car. We are having trouble shifting gears from high to intermediate and from intermediate to low. There is a grinding noise in the transmission. What remedy is there for it?

Answer.—The ends of the gear teeth are worn and battered up, due to the gears clashing together when shifted. This may be caused by the operator not throwing out the clutch while shifting, or may be due to the clutch spinning when released instead of coming to a stop. The only thing to do is to remove the transmission gears and examine their condition. It may be that the burred places can be ground off on a narrow emery wheel, but you will probably find that a new set of gears is required.

Carburetor Trouble.

My Buick 35 does not have the power on second gear that it should have. My engine also seems to "load up" on second gear. My carburetor is a Model L Rayfield. If I cut the gas down on the carburetor, it will back fire at high speed. Could it be that I have an air leak in the intake pipe? It is probable that I need my magneto recharged, or a new coil. My magneto is a Splitdorf. Any suggestions will be appreciated.

Answer.—An air leak could cause your trouble, but the adjustment of the carburetor is more likely at fault. An air leak can be easily detected by squirting a little gasoline on the suspected joints while the motor is running. If there is an air leak the motor will either slow down or speed up, depending upon whether the mixture is too rich or too lean. Air leaks may occur at the intake manifold gaskets and around the intake valve stems.

There is no air adjustment on a Model L Rayfield. You will find two knurled nuts or thumb screws on the side of the carburetor. The upper one is the high-speed adjustment, the lower one the low-speed adjustment. Both control the amount of gasoline. For less gasoline at high speed, turn the upper nut to the left. For less gasoline at low speed, turn the lower nut to the left. The above refers to the speed of the engine, not to the speed of the car. Your carburetor probably should be adjusted for more gasoline on high speed.

We doubt that your magneto or coil is out of order. If it were your trouble would be when the motor is running slow rather than when running fast.

Steam Condenser Surface.

We wish to condense the exhaust steam from a forty-four-horse-power steam engine by running a portion of the six-inch exhaust pipe in a rapidly flowing stream of water at 70 degrees F. The condensed water is to be drawn off by gravity by a drain pipe to a hot well. What length of six-inch pipe will have to be submerged to accomplish the result?

Answer.—About 300 feet of six-inch wrought iron pipe would be required if the steam leaves the engine at fifteen pounds gauge pressure. If you have only five pounds back pressure, about 250 feet would be required. Condensers are usually made of copper tubes about one inch in diameter. In copper tube condensers, two to three square feet of condensing surface is required for each indicated horse power of the engine.

As you evidently have plenty of flowing water, we would think that a jet condenser would be better for your purpose. Allow the steam to exhaust into a tank having one-half the volume of the cylinder. This tank has a spray of running water inside to condense the steam. The water required to condense the steam will weigh about thirty times as much as the feed water. The area of the injection orifice should be equal to the area of the piston divided by 250, in order to supply the above amount of condensing water.

Storage Battery Trouble.

Can you tell me what is wrong with my Prestolite storage battery? It was bought in 1916 and has been in use on a Maxwell car. It has been repaired four times at a cost of $20. It lasts from one to five weeks after fixing and then goes bad again. It seems to boil over the most at the left end; giving off a mushy substance. I have used nothing but pure distilled water. The boiling goes on when the car is standing idle. It starts with a leaky jar at the right side of the battery and one after another of the jars go dry. They must be filled every three days. This battery had been kept charged to 1.280 until it started to leak. All the cells are low now, except the two left ones. Is it worth while to spend any more money on this battery? The ammeter shows as many as twenty amperes some times; while again it does not show any.

Answer.—You evidently have some short circuits in your battery, due either to a collection of sediment at the bottom or to plates warped by overcharging. It looks like the cut-out on your car allows the battery to be charged too rapidly. We would suggest that you mix enough fresh electrolyte to fill the cells, give the battery a complete charge if possible, remove the old electrolyte and wash out the cells with distilled water, taking care not to allow the plates to dry. Then put in the fresh electrolyte and recharge the battery at once. Mix the electrolyte of distilled water and sulphuric acid to test 1.35. This extra strong solution is required because the plates will absorb some water while the sediment is being washed out. If this does not remedy the trouble, it would be best to purchase a new battery.

MOLINE Adriance Grain Binder

NEVER MISSED A BUNDLE

Mr. D. K. Smith of Attica, Iowa, says: "The draft and ease with which my Moline-Adriance Binder performs its work was really surprising, and I also wish to say, *It Never Missed Tying a Bundle.* The convenience and ease of all the levers for shifting the working parts, beats any Binder that I have ever seen. *I can gladly recommend this Binder to any one.*"

Mr. Smith is just one of many good farmers who enthusiastically endorse the Moline-Adriance for its reliability, light draft, convenience and lasting qualities.

Ask your Moline dealer about the Moline-Adriance Binder, or write us for illustrated literature.

FAMILY CIRCLE TALKS BY THE PUBLISHER

THE FARM OPPORTUNITY IN WISCONSIN TODAY.

I CONSIDER it a high compliment to be consulted by readers of The Wisconsin Farmer on their financial affairs, as so frequently occurs. If I can give any advice which will be of any assistance to my readers, I am indeed pleased.

I consider it to be the province of the publisher of a paper such as The Wisconsin Farmer to serve his readers in every possible manner. The publisher's duty does not stop with getting out the best paper possible. He should counsel with his readers whenever and wherever possible. Inasmuch as it is a physical impossibility for me to open the door of every one of the approximately 80,000 farm homes in Wisconsin into which The Wisconsin Farmer goes every week, most of this counseling together must be done by correspondence. When my readers show their confidence and trust in me by writing of their personal affairs, frankly and fully, asking my advice or counsel and otherwise making the relation between publisher and reader most cordial and intimate, I feel as though I were fulfilling my mission and I am pleased, indeed. My readers need have no fear that I will ever disclose any of their secrets; they are absolutely safe with me.

I am impelled to write along this line this week because of a letter received from a woman subscriber in Waupaca county, who asks my advice on selling off some of her pure-bred stock, in order to raise $500 to pay off a debt on silo, hay, and so on. I shall not disclose her name or address, but here is the major portion of her letter setting forth her problems and needs:

My Dear Mr. Pierce:—Maybe you could give me a little advice which I need very badly at present. I will explain as briefly as I can. Now we, my husband and myself, have a farm of 100 acres, with nice buildings, some unfinished. We bought this farm about ten years ago. Well, we first bought a sixty with a good house, but poor outbuildings. The barn was log, fit for kindling, a few old farm machines, two horses, one an old horse and one a gelding, also a scrub bull we sold for $30 and ten scrub cows we sold for from $35 to $40 apiece. Well, a year or so later my husband bought a lovely forty acres adjoining ours for $3,200, with a large house and a pig pen and two large barns. These were old frames, but had fine big timbers in them, and all helped to build us a new barn instead of the old log building. Well, we paid down on said forty $550, balance went in debt for. My husband has stumped a good share of it. Then he hired more money and bought a pure-bred Holstein bull and a registered cow. At present he has twenty-one head, ten pure breds and eleven grades. We bought about $850 worth of machines to work the farm with. Well, he went in debt to give the house a good painting and repairing, same on machines and $150 on a pure-bred bull when only four weeks, which is past three now and a fine animal. At present we have two teams of horses and an extra horse, also expect two colts in May and June. Our farm is worth $16,000 at least, I will say, with machines included. We are in debt about $7,800, including a few small bills. We have one bill of $300 on a silo. We have a double brick-walled silo and then all cemented from top to bottom like a big dish and steel bands every two feet from top to bottom.

Last season was such an unusually cold, wet season, and on account of ill health my husband didn't raise as much as usual, and when hay was ready to harvest we couldn't get help at any price. So this spring we are in a bad boat; have a bill for hay of about $150 and must buy seed potatoes and some oats for teams. Well, it seems bankers can't understand how hard it is sometimes for a poor farmer during his first years. At present I have a bill of $150 for hay due, another for $300 and a few small bills must be paid. I want to raise hay. Our clover is fine; also rutabagas in oats, oats, corn and as much land as possible in potatoes. My husband is ill with a stomach trouble. We have a good young man and two boys of our own, one thirteen last November and one eleven last November, so I think we can make it. My reason for selling off cattle is to get money enough to pay for hay and bills due. My husband is a hard worker, but not a good manager in some ways, and the bank won't lend him money without a signer, under any consideration, and I can't ask anyone to sign, so must sell stock to get money to help me over the bills now due. And if I can't make it, why, I can sell the farm, although it would break my heart to do so.

Believing as I do, most firmly, that now is the time to build up and breed up our herds, here in Wisconsin, instead of weakening them, I argued against selling the animals which my correspondent proposed to dispose of, urging that she be as frank with her home banker as she has been with me. Perhaps I could not do better than to print a part of my answer, as follows:

It is evident to me from what you write that you are not really in any financial straits, but what you need is a little ready money. This you ought to be able to get of your banker. It seems to me that if you would visit your banker and lay all the facts before him that he would be glad to give you the money. As to selling any registered stock or any good grade Holstein-Friesian cows at this time I certainly would not do it unless it is absolutely necessary. With the showing which you make in your letter it seems to me that you ought to be able to borrow enough money on a note signed by yourself and your husband to tide you over. You say that your place is worth $16,000. With the present price of milk and potatoes and other farm produce, you ought to arrange in some way to get the small amount of money which you need to tide you over. I should think you could arrange with some banker to take a portion of your milk checks until you paid back the loan. Or, if you have to do it, why not borrow some money on your cattle and then start in at once to pay it off a little at a time? The crops which you can raise on your place this year and milk which you can sell certainly ought to put you on Easy Street. In case your local banker is not in a position to make you a loan, why not visit the bankers at Waupaca? I know none of the bankers in your county personally, but sometimes where one banker is not in a position to make a loan, another can do so. I am judging your case entirely by the facts which you present me in your letter and it would seem to me that either the Old National Bank or the Farmers' State Bank at Waupaca, ought to be willing to loan you $300 to $500 for six months. As I understand, about that sum would tide you over.

I believe the financial returns of progressive farming here in Wisconsin will be bigger this year and for the next few years than they have ever been before. There is a good prospect of the government's establishing a minimum price for farm produce, so that the farmer will not suffer from overproduction or deflated prices. That being the case, we should make our acres and our herds yield to their very limit. Till every possible acre, make every acre yield to the utmost, breed up and build up your herds and by all means retain your pure-bred stock. It will pay, and pay well, this year, next year, and so on and on.

I am printing this letter and my reply because I believe the moral is obvious and is of interest to every reader of The Wisconsin Farmer. Consult your local banker, take his advice, hang on to your pure-bred stock, farm this year with redoubled vigor, and exert every energy toward taking advantage of the exceptional opportunity which is ours, here and now, in the Badger state. I firmly believe you will have reason for regret if you should do otherwise.

WHEN WISCONSIN WAS YOUNG.

IT IS hard to realize that a state like Wisconsin, for instance, where there is no spot more than a comparatively few miles from a railroad and where land, in the older portions, has already reached such a high price that young men are going to Upper Wisconsin to get a start on cheaper land, has been brought to its present high state of cultivation within a single lifetime. Such is the case, however. There are farmers still living in southern Wisconsin today who bought their land from the government for $1.25 an acre, whose early neighbors were the Indians and who were obliged to drive their products overland fifty miles, and even more, to reach a market. In this day of $3 wheat, $1.50 corn and $200 land, the younger people can hardly realize the wonders which have been wrought in the lifetime of us older folks.

I have often thought of this, but my attention was directed to it again while reading one of our big national weeklies, Collier's, which is publishing the autobiography of one of our leading novelists, a product of one of our Wisconsin farms: Hamlin Garland. Commenting editorially on Mr. Garland's story, Collier's says:

That vital flood of settlers surging out over the great plains made history so fast that now, after less than forty years, it seems a legend from the dawn of civilization.

Mr. Garland is still in the very prime of life, having passed the fifty-year mark only half a dozen years ago. Yet a man like him has seen a great state snatched from a vast wilderness and brought to a high state of productive cultivation, so that (according to the 1910 census) more than half the total land area of the state is improved farm land. Could there be more striking, convincing proof of the rapidity with which the farmer is working nowadays?

I have had the honor of meeting Mr. Garland and I am greatly interested in his autobiography because he is a native of Wisconsin and because his experiences duplicate mine in so many respects. His description of the old-time, wood-burning locomotives brought back to my mind, vividly, a similar engine which pulled the first train on which I rode, as boy. "All that day," he says, describing a railroad trip, "we rumbled and rattled into the West, feeding our little engine with logs of wood (which we stopped occasionally to secure from large ricks on the banks of the rivers) and halting at every town to take on or leave a car." Compare that train service with the vestibuled chair cars and sleepers on which we ride today on such long trips. Then compare the West of those days (1877 to 1880), as Mr. Garland describes it in his story, with the Wisconsin and Illinois, the Missouri, the Kansas and Iowa, of today. He is telling the story of how the neighbors came driving in to give his father and mother a surprise party, a "send-off" before they left Iowa, driven out by the chinch bugs, to seek a new home in the new lands of South Dakota. The chinch bugs had done their work only too well. "In vain did the Farmers' Institute lecturers plead for diversified tillage, predicting wealth for those who remained to engage in dairying," says Garland. "Farmer after farmer sold out and joined the exodus to Kansas, Nebraska and Dakota." Was it any wonder that his mother's face looked drawn and haggard, she who had experienced so many such moves, always toward the setting sun? Still there seemed ample excuse for his father's move, and Garland, then not quite of age, found himself feeling thus: "There was something large and fine in the business of wheat growing, and just as our harvesting machinery was reaching perfection, just as it seemed possible for us to handle our entire crop without hired help, it seemed a tragic thing that this plague of insects should come against us. I could not blame my father for his resentment and dismay." Here is the picture he paints of that good-by party, in the humble farm home, when the grain belt was young:

It was a very touching and beautiful as well as awkward moment for me, as I looked around upon these men and women, rough-handed, bent and worn with toil, silent and wet-eyed with the sorrow of parting.

I had thought our break-up deeply important before, but I now perceived its larger significance. It was all of a piece with the West's elemental restlessness. "Of what avail this constant uprooting?" I thought. "Is it not all a mistake?"

There, on a low mound in the midst of the prairie, in the shadow of the house we had built, beneath the trees we had planted, we were taking leave of one cycle of American colonization and entering upon another. The border line of the Middle West had moved on, and my indomitable sire was moving with it, even though in doing so he sacrificed his business and every friend he had. The free land of Dakota was vague as air at the moment. I heard a sound as of great gates closing behind us, and the fields of the West were wide and wan.

In the ten years of our life upon this farm we had seen the prairie disappear. Not one root of it was left. Barbed-wire lanes had displaced the trail. On every hand wheat and corn and clover had taken the place of the wild oat, the hazel bush, and the lily. Our house, small and commonplace to others, was now strangely dear. Therein Harriet had died. Through the garden Jessie's small feet had worn their wavering paths. Our very lives were woven into these hedges and rooted deeply in these fields, and yet, in response to some powerful inward yearning call, my father was about to set forth for a fifth time into the remote and unplowed West, and I was about to claim the grown son's right to a separate and divergent path. Small wonder that my mother sat with tear-blinded eyes while good and faithful friends crowded around her to utter their eternal farewells.

Such was the Wisconsin and Iowa of yesterday, as remembered by a man not yet old, whose memories are strangely akin to my own. Compare it with those states—and the rest of the grain belt—of today; a land of diversified farming, where, when one crop fails or is diminished, there remain a dozen to make up for it. Gone are the days when one crop failure drove men out upon the road again, to seek a new land and a new home. The days of permanent, productive farming have come, never to pass away. Surely, we are working rapidly, but none the less skillfully and effectively, when so much has been accomplished for Wisconsin in such a brief time and all of us are so inspired to make the future productive of even greater things than the past.

OUR DEBT TO THE SUNDAY SCHOOL.

IT IS 100 years ago this month since the Sunday school movement was officially started in the United States. We might well pause a few minutes to consider what an immense factor for good this movement has been in America, in the country as well as in the city.

As the story comes to me, it is a little more than 100 years since an English newspaper editor (I am

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-in-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of 100 or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address

The Wisconsin Farmer Madison, Wis.

Wisconsin Legislature.

It had been hoped that the present session of the legislature could be brought to a close during the present month, but both houses see themselves confronted with enough work at present to last well into June. The assembly is ahead of the senate in the amount of the work done and for this reason many of the farmer members in the assembly have asked leave of absence for the current week in order to assist planting the home acres. Fully one-third of the members in the assembly are farmers.

The state prison of Waupun, where binder twine is manufactured, has been granted permission to purchase 400 acres of land for farming purposes a few miles out of Waupun from the profits shown by this industry. Last year's profit amounted to $80,000 and estimates for the coming year place the sum at $125,000. The new land would cost $70,800. This land is to be farmed and the profits used for covering the cost of the state institution.

The bill relating to the reclamation and settling of cut-over lands will come up for third and final reading in the near future. Little opposition is expected in the house, though the senate might prevent final passage of the bill later on.

The senate passed a bill authorizing the university to conduct investigational and demonstrational work to determine the most efficient and economical methods of land clearing. This includes experimentation with mechanical devices and explosives under varying conditions. The authorities are given free leave to experiment with measures that will help future clearing of our cut-over lands in the state.

The state brand for butter and cheese bill, which was reported for indefinite postponement last week, has been revived and passed the second reading in the senate and has been ordered engrossed and is to be read a third time shortly. This has given friends of the bill hope that its passage during the present session of the legislature can be brought about. Everything possible will be done to let the assembly see the good points of the bill when it reaches that body, for there is a good chance now that it will pass the senate.

Another hearing on the tuberculosis bills was held last week, but nothing definite resulted. The bills will probably be referred back to the assembly without recommendation and the final fight on the measures will be made on the floors of the senate and the assembly when the bills come up for passage.

The bill repealing the fire insurance laws of the state was voted down by the assembly and this puts it on the dead list for the present session.

Recognition of services of men going to farms this summer was proposed by a measure introduced last week. Those working on farms for the summer were to receive an honor badge from the state. The bill was referred to the finance committee.

The assembly passed the bill providing for an appropriation of $20,000 for roads around the military reservation at Camp Douglas.

Badger Farmers Busy.

Wisconsin farmers are very busy—too busy right now to even read all the literature sent out to them through the various agencies to encourage greater food production. The Wisconsin Farmer believes that the farmers of Wisconsin are loyal in this time of national crisis and that they had fully intended to do their full duty long before it was considered advisable by the state and other agencies to conduct a campaign of urging. This is no criticism upon those who have been active in the campaign, nor do we wish to suggest that their work has been for naught. On the contrary, The Wisconsin Farmer believes that these agencies which have been trying to do their part to insure better crops should take courage from the situation. The farmer, as we have said, has been thinking for a long time along the lines which so many people are now suggesting to him. He has been making preparation, laying away the seed, fall plowing last year, sharpening up the tools and machines and in other ways getting ready for a big season. He has been inspired to this by several things, not the least of which is the knowledge that his country needs the food which he can raise. He has been encouraged to plan largely because of the high prices for farm products. Furthermore, he has been getting the idea of more intensive farming in this year 1917, by reading his farm paper. The farmer of today reads his favorite farm paper when he is obliged to put other reading matter aside for lack of time. Our renewals on subscription this year, our letters from farmers showing keen interest in the agricultural and live stock situation, all prove to us that the farmer has been interested for months in bigger production in 1917. The Wisconsin Farmer is glad to help in any way that it can. Those of our readers who have as yet failed to take advantage of our renewal offers should send in their remittances at once, so that issues will not be missed. If you do not get the paper regularly let us know at once. If you desire an extra copy to loan to a neighbor whom you think might be induced to subscribe, write to the office and it will be sent at once. Subscribers should feel free to communicate with the publisher or the editors at any time on any subject in which they are interested. We are here to serve, and when you subscribe you give us our opportunity.

The Glory of the Farmer

"The glory of the farmer is that in the division of labor, it is his part to create. All trade rests at last upon his primitive activity. He stands close to nature; he obtains from the earth the bread and the meat. The food which was not, he causes to be. The first farmer was the first man, and all his historic nobility rests on possession and use of land. Men do not like hard work, but every man has an exceptional respect for tillage and a feeling that this is the original calling of his race; that he himself is only excused from it by some circumstances which made him delegate it for a time to other hands. If he has not some skill which recommends him to the farmer, some product for which the farmer will give him corn, he must himself return into his due place among the planters. And the profession has in all eyes its ancient charm, as standing nearest to God, the first cause."—RALPH WALDO EMERSON.

Planting One Ear to the Row.

While special attention is being directed to the problems of making the 1917 crop as large as possible, we must not lose sight of the fact that the food situation next year might be much more serious than it will be during the coming winter. Realizing that situation, superior wisdom will be shown by those corn growers who appreciate the fact that there is a difference between the yielding ability of seed taken from ears that are similar in appearance. The experiment stations have demonstrated over and over again that the seed from an individual ear may differ widely in its yielding ability from one that looks equally well. In some instances the yield would be double when the character of the soil and the method of cultivation were identical.

This high-yielding characteristic is an inherent tendency that cannot be detected by a physical examination, and our contention is that it will pay to take the time this year to select out a few dozen ears and plant the seed from each in a row by itself. It will only take 150 kernels to plant a row fifty hills in length and this will be sufficient to test out the yielding ability of individual ears. Where the above plan is followed it is safe to assume that some rows will yield as high as seventy or eighty bushels per acre if conditions are normal this year and the soil is fairly good, whereas other rows will drop as low as fifty or even forty bushels per acre. When this information is obtained at husking time the grower is at once placed in possession of a few bushels of high-yielding seed. Possibly out of his fifty rows ten or fifteen will give a big yield and the balance can be thrown into the discard. Several bushels of seed from the high-yielding rows will be obtained and this, when planted in 1918, will affect the yield most favorably on a considerable acreage on that farm.

Those who begin this plan will carry it a step further by putting in a seed plat the following year and, if possible, discover individual ears that inherit a still greater ability to yield well. There is practically no limit to what can be accomplished by pursuing this plan, and in these days when we are talking about increasing our food supply it should be understood that in no other way that we have any knowledge of will a given amount of labor accomplish so much as by obtaining possession of a supply of seed bred up with a known high-yielding capacity.

Sow Rape in Every Spare Corner.

In spite of the great demand for increased production this year there will be lots of idle land in the corn belt due to the fact that sufficient help is not obtainable to put in and take off a crop. When it comes to handling corn there is a limit to what one man can do and no amount of urging will materially increase that allotment. Those who use forage crops extensively, thereby cutting down the amount of corn that will be fed this fall and winter, will accomplish the same purpose as if they handled a greater acreage of corn.

In this connection too much emphasis cannot be placed upon the value of rape, particularly by those who are raising a considerable number of hogs. Rape pasture is rich in flesh-forming material and if used in conjunction with corn very satisfactory gains may be made and these will be put on at a relatively low cost.

The Ohio Station pastured an acre of rape 119 days last year and during this time the rape saved corn to the value of $77.87. Of course, a small amount of corn was fed every day. In the face of this record one may safely conclude that it will be profitable this year to seed every foot of waste land to rape, particularly those spots on the farm that can be conveniently used for hog pasture. Old feed lots can be used to great advantage in this way and it is not even necessary to plow them up. Go to it with a disk, as a satisfactory seed bed can be prepared in that way. Five or six pounds of rape seed per acre seeded broadcast will produce a good stand, and if the hogs can be kept out for five or six weeks there will then be an amazing amount of good feed furnished during the balance of the season.

It is doubtful if at any time since the spring of 1899 has there been as much clover killed out as was the case this year, and as a result there will be a light hay crop harvested and there will be a scarcity of pasture. There will be plenty of cases this year where meadows will be left, although they are less than half a stand, and in those instances it would be a profitable venture to disk up part of the acreage and sow rape seed broadcast in them. Rape is not a good pasture for dairy cows, but it can be used advantageously in pasturing young cattle and, as said before, it is exceedingly satisfactory for hogs, as it is both palatable and nutritious.

Growth of Dairying in Waupaca County.

Our readers will be interested in a historical sketch of the Iola, Waupaca county, creamery, which was organized in 1896 with about fifty patrons. The 19th of January, 1897, C. L. Passmore had charge of the butter-making department and remained in charge until 1914. In the year 1897 the output was 71,918 pounds and the average price paid the patrons for butter fat was 16½ cents per pound. In spite of this low price for butter fat, as compared with present prices and the scarcity of cows, the building had to be enlarged four times to take care of the increase in business.

In 1902 there was 201,013 pounds of butter made and the farmers were paid 25.5 cents per pound for butter fat, receiving a total of $41,780 for the year's output.

In the year 1910 the number of patrons had increased to 300 and the creamery made 508,303 pounds of butter. The farmers were paid an average of 33.99 cents per pound for butter fat or a total of $144,366.

In 1914 R. C. Cleaves took charge of the butter-making department and is still in charge. In 1916, the twentieth year, there were 260 patrons and the output was 535,032 pounds of butter. The average price paid to patrons for the butter fat was 35.44 cents per pound, while the Elgin average for the same year was 32.72 cents per pound of butter. Last year the patrons received $155,982 for their portion of the proceeds.

From January 1, 1897, to December 31, 1916, covering a period of twenty years, the Iola creamery has manufactured 6,980,286 pounds of butter, for which it has received a total of $1,829,974. The patrons of the creamery in the same period have received $1,707,192. The cost of operation for the twenty years has been $122,779, or, in other words, the butter has been manufactured and marketed at an average cost of 1¾ cents per pound.

Recently a new creamery was put up and the cost of the new building so far is as follows:

Site	[illegible]
Contract for building heating plant, wiring	1,290.00
Warehouse	[illegible]
Refrigerating system	[illegible]
Pasteurizing vats	[illegible]
Deodorizer	1,250.00
Boilers and setting up same	[illegible]
Engine, shafting and belting	[illegible]
Sewer	[illegible]
Well	[illegible]

Taking into consideration the item moved in from their old plant, the actual cost of the new creamery is about $25,000. This is ten times the cost of the original creamery building twenty years ago. The refrigerating system alone in the new creamery cost practically the same as the creamery cost which was built in 1896.

We have seldom seen any clearer statement of the development of the dairy business in Wisconsin than this.

If there is some doubt as to the necessity for liming for alfalfa the most practical and satisfactory way to determine this point is to sow a small field to alfalfa, liberally liming a part of it, and leaving a part unlimed. The growth of alfalfa in the two parts will be a good test of the need for lime.

FAMILY CIRCLE TALKS—By The Publisher.

(Continued from page 3.)

glad that the press is entitled to the credit for launching such a far-reaching, magnificent campaign) stood one Sunday morning on a sidewalk in the city of Gloucester, England, and watched a gang of boys and girls playing in the street. In those days there were no child labor laws and those children, working long hours in the mills, had only Sunday to play. They knew no school training, they knew little discipline of any kind.

As the English newspaper man watched those poor, dirty, ragged urchins at play in the streets of the big city, the idea of the Sunday school was born in his brain. He hired some women school-teachers to teach those neglected boys and girls of the mills on Sundays and he paid the children to go to those teachers. Along with the teaching of reading and writing he insisted that religious instruction be given. Such was the beginning of the Sunday school movement, which has since swept the world until today there are 310,057 Sunday schools, 2,699,630 teachers and 27,345,407 Sunday school pupils in the world, practically one-half of the number being located here in our own country.

It was a few years later, in 1817, that the movement was really begun in the United States, and it is these American beginnings which were celebrated in so many of our churches, both in town and country, last Sunday, for the American Sunday School Union had been planning the centennial celebration for some weeks.

It seems to me an opportune time for me to pay my tribute to a factor in our national development second to none: The Sunday school. I am sure that my readers, regardless of denominational differences, will agree with me that anything which starts our boys and girls in the right path and keeps them there through the formative period of their lives, is a big and vital factor in our national progress and our individual development. Personally, I am free to admit that the Sunday school played a big part in shaping my life at a time when traits were being developed and character formed which were to guide me from that day to this. As I think over the subject, my mind goes back to my boyhood days on the farm of my father near Upper Sandusky, in Wyandotte county, Ohio, the same county in which the reservation of the Wyandotte Indians was located. Our family consisted then of father and mother and six children. My parents were devout Christians and dedicated themselves to the task of starting their children out in life with the proper religious training. I can recall, as though it were only yesterday, how, on Sunday mornings, we children would sing Sunday school songs, after breakfast, until it was time to hitch the team to the farm wagon (our only conveyance in those days), spread in the bottom of the wagon the hay which served the double purpose of bedding for us children as we rode to church and of feed for the horses at noontime, and then we were off for the four-mile ride to town.

Church attendance was almost an all-day affair in those days, now almost sixty years gone by. Arrived at Upper Sandusky, the team was unhitched near the church and the entire family proceeded to devote the greater part of the day to religious worship. Church services were generally held first, followed by Sunday school. I can recall that the minister's name was Rev. Thayer and that he was a vigorous speaker, flaying the flesh and the devil, sometimes frightening us children into penitence, other times leading us into the paths of righteousness by his eloquence. After Sunday school was over (the two services lasting well on to two and a half or three hours altogether) we usually had lunch in the rear part of the little one-room church, except on those momentous occasions when some town member of the congregation took us home for dinner, an affair which lingered in our memories pleasantly for many weeks. After lunch, we all repaired to the church again for the afternoon sermon, lasting another hour and a half or two hours. Then came the general handshaking, the hearty goodbys, and, after hitching up again, we were off for home, we children bouncing on the now bare bottom of the wagon, often with considerable discomfort, for the roads were none too good and home must be reached in time for the evening chores.

Those days are long past now, for time has silvered my hair, although it has failed to dim my memories or to obscure the pleasure which I derived from attending those services, Sunday after Sunday, in the years when my character was being formed and I was laying the foundation for the future. I owe a debt to the preachers and the Sunday school teachers of those years which I recognize only too willingly nowadays. Theological styles have changed with the passing years, but honor and truth and righteousness are eternal. The principles taught me in that little church, by those devoted men and women, have guided me throughout all the intervening years and shall continue to guide me until I am gathered to my sainted father and mother and all things are made clear to my eyes. I honor the church of the country, the Sunday school wherever it may be found, and I am glad of this opportunity to pay my humble tribute to both. Long may they continue to model and mold the lives of young and old and to make this a better, brighter, happier world for us all, through countless generations.

James M. Pierce

WISCONSIN FARMERS' CLUBS

Club Has Soil Specialist.

To the Editor:—Our little club, which consists of fifty-three members (and their families) was organized in March, 1915. Up to the present time we have done very little work along special lines, other than just endeavoring to build up the social side of our community, and, in this, we are certainly succeeding.

We meet the last Friday of each month in our town hall and serve a picnic dinner at 12:30 o'clock. It goes without saying that this is a drawing card for the most of us. The business meeting usually calls to order at about 2:30 o'clock. We are now a full-fledged club with a president, vice president, secretary, treasurer and sergeant at arms, besides our executive and program committees. The program committee invariably stages a fine program, usually rendered by local talent, of which we have an abundance.

Last year we had a soil specialist here to analyze our soils. Several of the farmers were very much interested in this. Recently, we received a communication from this gentleman on the subject of a "Sandy Soil Farmers' Institute," which he suggests as a good idea for the club to take up at some time this coming winter. The club is quite interested in this matter and is giving it consideration. During the winter our program committee put on a very interesting debate on a local bridge question. This line of work was new for us and drew out a large crowd. On a few occasions we have had in a motion picture machine and operator, giving us illustrated talks on some of the latest topics of the day. These were thoroughly enjoyed by old and young and will always prove a drawing card for a club. Then, too, we have been improving the accommodations about our town hall and premises. Through the coöperation of our club and the town board, new sheds for sheltering horses were built. These filled one of those long-felt wants and will stand as a monument to the efforts of the Caledonia Farmers' Club for some time to come.

We have also purchased some new furniture for the interior of our hall and will add more improvements from time to time as our circumstances permit.

Perhaps the best instance, illustrating the interest felt in the meetings of this particular club, was shown at our last meeting: The president mentioned the fact that our next club meeting would come just in the thick of corn-planting time and suggested that perhaps we would best postpone this meeting. There were perhaps more than 100 persons present and not one among them willing to make a motion that we postpone this meeting.

Mrs. Edwin Scherr,
Secretary Caledonia Farmers' Club
Trempealeau, Wis.

Discuss Schoolhouse Problems.

To the Editor:—Our club programs for the past year have been of an unusual nature. We plan to have an out-of-town speaker every other meeting. Our particular community was interested in the schoolhouse problem, and two of our meetings were devoted largely to that subject. County Supt. M. L. Barkley gave us an illustrated lecture on the rural school problem. Charles Harper, of the state department, also talked to us on schools, and Prof. F. T. Ullrich gave us an illustrated lecture on the importance of practical agriculture in the school. Our last meting was a patriotic one. Songs were sung and we had recitations by the grammar grades and a patriotic talk by Richard Lloyd, of the Wisconsin State Journal. I am very glad to see The Wisconsin Farmer taking some interest in our clubs.

Joe Roberts.
Secretary Blue Mounds Neighborhood Assembly, Dane county, Wis.

GETTING READY FOR REAL WORK.

Take Up Food Production.

To the Editor:—With our March meeting, the Lake View Farmers' Club, in Walworth county, completed its fourth year of successful work. The interest in our club is still growing and the membership larger each year. Our annual fair, held in 1916, was pronounced the best ever. The premium list amounted to over $200, which we consider worth while, and it was a great encouragement to the boys and girls who received the money. Our lecture courses are another valuable part of our club organization. The home talent number and Dr. Russell Conwell's famous lecture, "Acres of Diamonds," were exceptionally well received. In connection with our farmers' club, and as a part of it, we have the Junior Farmers' Club, composed of our boys and girls. We had the Champion Boys' and Girls' Club at the Wisconsin State Fair, 1916. Relative to the programs for our individual meetings, we have quite a variety of instructive and entertaining numbers aiming to create a greater interest in farm life and community coöperation as well as the social good times for the members. At our April meeting we spent considerable of time discussing the great agricultural needs of the community at this time and we appointed several committees to help in every way possible to stimulate a greater production among our club members. We are going to try and see to it that every member of this club exerts his best effort in the production of more food for the nation in our time of need. It seems to me that this would be the most important work in the club during the coming season and I believe it is a task in which we will be able to make considerable progress. We are always very glad to stimulate and encourage interest in the farmers' club movement, and I am pleased to know The Wisconsin Farmer takes the same position. A great deal of good, I believe, may be done in this way.

Paul F. Gavin.
Walworth Co., Wis.

The Farmers' Open Forum

WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

Interesting Boys and Girls.

To the Editor:—I am very much pleased to note the interest which The Wisconsin Farmer is taking in the subject of agricultural activities in secondary schools. In our own school we are offering a full four-year course in agriculture. Following up the idea that the only way to make this course vital is to have the student carry to completion some farm project, and because we lack the necessary ground to carry out this work at school, we have arranged to have students select some summer project that they may carry on during their vacation.

Practically all of our boys belong to a "corn club" and will grow corn this summer. The girls have a tomato club and will grow tomatoes this summer. The tomato plants are being grown in the school hotbed which was made by the pupils in the seventh and eighth grades. (Am enclosing a photo taken while the boys were at work on the hotbed.)

To stimulate interest in the growing of pure-bred corn we are putting on an acre-corn contest. The local bank has put up a silver cup and two cash prizes to the boys making the best showing in this work. The corn to be used in this contest is to be either Wisconsin No. 7 or No. 12.

This is the first year we are doing any organized club work, so have no past record to boast of, but hope to make a good showing this season. We are hoping that the school board may put up some prizes for girls making the best records in tomato production.

J. R. Kahoun,
Principal Cobb, Wis., High School.

Eau Claire County Breeders.

To the Editor:—The Eau Claire Holstein Breeders' Association held one meeting during the past winter and this was chiefly a business session for the election of officers. On account of the intense cold weather there was a small attendance, although much interest was manifested by those present. G. I. Ingalls, county representative, presented a plan of advertising which met with hearty coöperation. It was decided that our club was not large enough to undertake the plan and we agreed to ask the Guernsey and Jersey clubs to join us, but up to this writing no definite arrangements have been made. It is planned to get up a catalog of all breeders, permitting each breeder to use as much space for advertising as he chooses to pay for. These booklets are to be sent to interested parties on application. Our annual picnic will be held at the Geo. McLellan farm, situated southeast of Eau Claire, on the third Friday of June, 1917. Our officers for the present year are: President, Charles Newhouse, Augusta; vice president, G. H. Comings, Eau Claire; secretary-treasurer, B. F. Von Berg, Augusta; director, B. M. Arrus, Augusta.

Frank Redlaczyk.
Eau Claire Co., Wisconsin.

Send Cattle to New Mexico.

To the Editor:—The Manitowoc County Holstein Breeders' Association is sawing wood and making gains faster than some might think. We now have a good live association of more than 100 members and the people in the city also coöperate with us. A few weeks ago C. F. Moon, of Portales, New Mexico, came here to see if he could get some good grades. He wanted only good grades which would produce not less than forty pounds of milk a day. He called on me to go with him and show him the best herds. It was poor traveling, as the roads were just breaking up, but in a short time we found a carload of what Mr. Moon called the finest cattle that he had seen. Before coming to our county he had visited several other Holstein centers. He found that not a great many buyers had combed over the stock here. The cattle which he secured were of good size and individuality and came out of herds with good herd sires. I believe that the cattle which he took with him to New Mexico will be fine advertisement for this county, as the new country is just beginning to get the right type of Holsteins. Several fine seven-day records as well as yearly records have been made by pure breds in this county and pure breds are fast becoming a leading factor in our dairy business. Good pure-bred bulls are being shipped out of this county almost every week, and in most cases to Upper Wiscaonsin counties. Heifers are scarce, as breeders are stocking up. It will be but a few years until we will have the very best pure breds for sale in this county and we will rank as high as we now do with the grades. The hospitality shown to buyers by our breeders has helped us to make sales and leave a good impression with those who have visited our county from a distance.

Charles Hampke, Sec.

Eight Hundred Bushels of Onions Per Acre.

To the Editor:—I am not a very good hand at writing, but will try and tell you how I raised 100 bushels of onions on one-eighth of an acre of land.

We have to plant on low land. Put on all the barnyard manure that can be plowed under and plow late in the fall just before it freezes up. Leave it rough, just as it was plowed, through the winter, then in the spring, as soon as the frost is out on top, begin to drag with a spike-tooth harrow and work it down hard. You can't work it too much. Work wood ashes in on top. I left some barrels in town at different places. They were glad to have me take the ashes away. Wood ashes will kill the onion weevil and also wire worms. When I go to town in winter as fast as the barrels are filled I take them home, then in the spring I have it ready. As soon as it can be worked down hard in the spring I plant the seed. The earlier the better. Freezing of the ground, or snow, will not hurt them.

I sow the large red Wetherfields. I sow with a garden drill in rows fourteen inches apart and I mix in a few radish seeds, so I can see the rows as soon as they come up. The radishes can be pulled out when weeding and will not hurt the onions. Keep the weeds out and cultivate often, but shallow. The ground must be kept loose on top for about an inch. The harder it is below the better. This will cause the onion to grow out of the ground and prevent thick necks. I leave them quite thick in the row—about two or three inches apart. They will crowd out as they grow.

I have always grown a few onions each year—never more than three-fourths of an acre. Have had some failures, but have not had a failure since I plowed in the fall and put ashes on in the spring as a top dressing. The 100 bushels on the eighth of an acre is the best I ever did. The rows crowded out so you could hardly set your foot between the rows. Some persons could not believe it and came and measured the ground. If this will help anyone who wants to raise onions I will be pleased.

Jas. H. Pugh.
Waushara Co., Wis.

Organize the Lumbermen.

To the Editor:—It looks now as though we might be short of farm help in this neighborhood this fall or the latter part of the summer. We will be able to use high school boys and probably some men from the city. I think it might be well for someone to take up the work of organizing the large number of lumbermen who will not be in the woods during the summer. At least we should be able to keep them out of the woods until the fall work is completed. From conditions in this county, I would assume that unless something unusual occurs, we will not be greatly handicapped by shortage of labor.

Douglas Co., Wis. J. M. Walls.

Using Hare For Food.

To the Editor:—I have always been a lover of pet stock and I saw an article in your paper recently by Mr. Hartmann on Belgian hares which hit me in a tender spot. Along in 1890 or 1891 I began raising the little pink-eyed white rabbits, and a few years later gave them up for the Belgians—not the Rufus Red, fine, rangy fellows that we have now, but a pretty nice pet, and great for eating. Talk about your spring fries, chicken isn't in it with a Belgian hare about three and a half or four months old, and why more people do not raise them for meat I do not understand. Take it in villages and small towns where a person has a small lot, they could keep a pair which with average luck would produce $80 or $100 of the finest kind of meat at very little cost.

As for food, nice, bright hay of any kind will do, but I prefer alfalfa or clover with oats, caring for them the same as you would sheep when on dry feed in the wintertime. They do well with carrots, sugar beets and mangles as green feed, but above all do not feed them cabbage or lettuce unless you want pot belly, which will soon turn into bowel trouble and then sure death.

I kept water before mine continually, also salt. Keep the hutches well cleaned at all times and so avoid sore hocks. Also keep them off the ground. A hutch 2½-2½x4 feet long makes a nice size for the does, 2½x2½x3 feet for the bucks. Have them made tight on two ends, the top, bottom and back so no draft can get to them. They cannot stand a draft or the heat, but will stand all kinds of cold. I have one doe that kindled in that cold snap this winter when it was 20 and 22 degrees, and I never had a doe do better or raise a finer litter.

The does and bucks should be separated when two or two and a half months old, never left longer than three months or there will be trouble. Never put young bucks and old ones together, for they will fight all the time.

When feeding to finish off for market I feed some corn and carrots every other day.

M. M. Lanphere.
Rock Co., Wisconsin.

In spite of the activities of the food committee of New York City, headed by George W. Perkins, to keep down the cost of living, the price of rice, one of the staples specialized in by the committee, is higher today than it has ever been, and, according to wholesale dealers in New York, it will continue to advance. Some of the dealers go so far as to predict that the wholesale price of the popular grades will go as high as 10 cents a pound before the new crop comes in, in September. Since Mr. Perkins' committee advocated the use of rice as a cheap and healthful food the wholesale price has almost doubled and the retail price has advanced from 5 to 8 cents a pound.

Come to Detroit
The Automobile Center and

LEARN THE AUTOMOBILE BUSINESS—EARN $75 TO $300 A MONTH

Detroit trained men get preference and jobs quickly. Think what it means to learn in the Michigan State Auto School. Factories endorse our School, glad to employ our graduates or offer them territory. Men are needed everywhere as testers, repair men, chauffeurs, garage men. Hundreds of our graduates start in business for themselves.

44 auto factories in Detroit and 140 parts factories. Students get actual experience in handling all kinds of electrical auto equipment. Just installed a Sprague Electric Dynamometer for block testing purposes for students' use.

Detroit Is Place to Learn—Start Any Time

We teach you to handle any auto proposition. Students actually build cars from start to finish, getting factory training in assembling, block-testing, road testing, everything. Special complete course in Oxy-Acetylene brazing, welding and cutting, separate from regular course. All leading types of starting, lighting and ignition systems in operation. Six cylinder Lozier, eight cylinder King used for road instruction. We have the following completely equipped chassees—

Studebaker "6" 1917 chassis	Buick Light 6 1917 chassis	Winton "6" 1917 chassis
Hudson Super-6 1917 chassis	Chalmers "6-30" 1917 chassis	Packard Twin-6 1917 chassis
Cole "8" 1917 chassis	Saxon "6" 1917 chassis	Detroiter "6" 1917 chassis
Detroit Electric 1917 chassis	Maxwell 1917 chassis	Overland 1917 chassis
G. M. C. Truck 1917 chassis	Oldsmobile "8" 1917 chassis	Willys-Knight 1917 chassis

School Open All the Year. Graduate in 10 to 12 Weeks. Enter Classes Any Time, Any Day. Three Classes Daily: Morning, Afternoon, Evening.

Money Back Guarantee

We guarantee to qualify you in a short time for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, or automobile dealer, paying from $75 to $300 monthly or refund your money. We have constantly more requests for Michigan State Auto School Graduates than we can supply.

THIS IS ONE OF FEBRUARY, 1917, CLASSES.

Prepare to Serve Your Country NOW

The United States needs thousands of truck, transport, aeroplane and motor cycle drivers. Trained competent men are needed, men who can take care of the machines, men who know how to keep them in service. Any piece of motor-driven machinery the government owns or will own must be in service. Preference will be given to trained men. No matter what service the Army is doing, it must be fed. If it is on the firing line, it will need thousands of rounds of ammunition. The importance of trained men is very evident. Food and ammunition must be delivered regularly. Then too the army must often be transported.

Quartermaster Department and Signal Corps Need Trained Men

The Michigan State Auto School trains men thoroughly. Every student learns pleasure cars, trucks, motor cycles, and gasoline motors of every kind from A to Z. Graduates of the Michigan State Auto School are in big demand by the leading Automobile plants at Detroit. These factories know from actual experience that our men are thoroughly, completely, and practically trained.

No matter what happens to a truck or pleasure car a Michigan State Auto School graduate is competent to repair it. Cars in the care of a graduate get highest efficiency. This is the kind of men Our Government wants and is daily enlisting. Trained men who will be efficient themselves and keep every bit of motor driven equipment in the most serviceable condition.

LEARN A SUBSTANTIAL BUSINESS

Men who become trained in the Auto Business and serve their country can go into a permanent business as soon as their services are no longer needed. The trained mechanic is always in big demand. His ability is recognized at once. Ours is the largest Auto School in the country. Better jump on a train and come to Detroit as hundreds have done.

1405 Auto Bldg., 687-89-91 Woodward Ave., DETROIT MICH., U. S. A.

CURRENT EVENTS

CONGRESS spent the major portion of last week debating the conscription age and exemptions, both houses having passed the bill providing for raising the nation's new army by draft instead of waiting for voluntary enlistments. The maximum age of the men to be drafted was the main point on which the two houses differed. As passed by the senate the measure provides for the draft of men between the ages of twenty-one and twenty-seven, while in the house measure the age limits are fixed at twenty-one and forty. The senate authorized Theodore Roosevelt to organize a division of American troops to take abroad, while the house turned this request down, evidently fearing the political effect in the next presidential campaign. It is known that President Wilson is favorable to sending American troops to the fighting line in France, just as soon as the European allies think it best, but he holds to the belief that, for the present at least, the shipping facilities are needed more for sending foodstuffs and munitions abroad than for sending men. In a speech delivered at Chicago, Roosevelt continued to urge for permission to raise his troops and to lead them in France, saying: "I ask that I and those dearest to me and closest to me by blood shall be given the chance to prove the truth of our endeavor and be sent at the earliest possible moment under the flag to the firing line. I do not ask for men in the classes which would be taken under the administration's plan for an army raised under the obligatory system. I ask for men who would not otherwise be allowed to go. The force I propose to raise would represent an absolute addition to the nation's military strength, an addition which could be used at once, which would serve to put the flag and keep the flag on the firing line during the time that the great army was itself being raised, and while our flag would otherwise not be on the firing line. The favor I ask is the great favor of being allowed to render a service which I believe that my record entitles me to say I am able to render."

GENERAL JOFFRE and Vice Premier Viviani, heading the French war delegation to the United States, were accorded a wonderful reception in congress last week, arousing the greatest enthusiasm. Viviani delivered a stirring speech, while Joffre, who does not speak English, simply thanked the lawmakers for their reception. Both men visited Mount Vernon, the home and burial place of George Washington, and paid their respects to America's first president. In a message delivered to the American people, through the press, General Joffre, France's great war hero, told the people that France cherishes the confident hope that the stars and stripes will soon be flying on her battle lines. Victories sure to be won by the soldiers of the two republics, once more fighting shoulder to shoulder for liberty, declared the hero of the Marne, will "hasten the end of the war and tighten the links of affection and esteem which have ever united France and the United States." The marshal, replying to questions, said he deemed it advisable to send one American unit at a time to France rather than to wait for the complete equipment of a big army, because of transportation problems. The French delegation came out to the grain belt last week, visiting Chicago, St. Louis, Kansas City and other places in the middle West, arousing the greatest enthusiasm throughout their entire trip.

THE enormous inroads in the world's shipping made by German submarines within the last few weeks has brought to American government officials a full realization of the disaster that faces the United States and the allies if the undersea warfare is not checked. Governors and state representatives at Washington, last week for a national defense conference, took home to their people a message from the government emphasizing the menace to America and urging that there must be the fullest coördination by the states in war preparation if Germany is to be defeated. Secretary Lane told the conference that the great destruction of ships was threatening the existence of Great Britain and France and menacing the United States. No one, he said, knew the exact number of ships lost recently, but estimates put last week's submarine toll at 400,000 tons. Secretary Lansing in a statement declared the seriousness of the submarine situation could not be exaggerated and that it was time the country awoke to the true facts. Reports to the state department give a total of eighty vessels lost in one week, figures much higher than any contained in recent British announcements.

JAMES W. GERARD, former ambassador to Germany, told members of the Chicago Bar Association at a banquet given in his honor that the war with Germany would be "long and bitter." Mr. Gerard asserted that there was little likelihood of a revolution or uprising in Germany. Although the people of Germany are feeling the pinch of hunger, he said, there is no real probability that starvation may put an end to the struggle. There is enough food in Germany to last until the next harvest in July, he declared: "Many persons in this country believe that we are not actually in this war," Mr. Gerard said. "There is danger in such a view. There is a long war ahead of us, and we are in it until the finish. The fight will be long, but there is a prize ahead of us. We are in the fight because we could not keep peace with honor. We are fighting this war for ideals We are fighting for liberty and democracy and the permanent peace of the world This great prize only will be obtained when Prussian autocracy has been overthrown."

SECRETARY McADOO announced last week that the first offering of the bonds authorized under the war finance law would be a $2,000,000,000 "Liberty loan" issue, open to popular subscription at par, and that subscriptions would be received till June 15th, next. The bonds will be dated July 1st and will be ready for delivery on that date. Although department stores, newspapers, bond houses and many other organizations, in addition to banks, will be utilized in floating the bonds, the twelve federal reserve banks will be designated as central agencies in their respective districts. Details as to the denominations of the bonds have not yet been prescribed, but the lowest denomination will be so small as to place the bonds within the reach of every investor. Many offers of assistance in floating the issue have been received from women's organizations, and the secretary will organize a woman's committee to assist in obtaining subscriptions and distributing the bonds.

IMMEDIATE assistance to Russia and France in strengthening their railway systems is planned by the American government. The first step will be the dispatch of a commission of four railway experts, including John F. Stevens, a consulting engineer, who was chief engineer of the Panama canal commission before General Goethals. The plans of the defense council call for sending the entire American surplus rolling stock and expert employes abroad. The commission to Russia will give expert advice there and will seek to do everything possible to coördinate that nation's transport system for the movement of supplies and troops. American railway schedules will be altered so as to run only necessary passenger trains to free equipment for the movement of freight and leave as large a surplus as possible. Word reached Washington that in order to relieve economic conditions in Petrograd and also to lessen the strain on transportation facilities the Russian provisional government is transferring to south Russia the great munitions and supply plants in and near the capital.

GENERAL business conditions throughout the country, the federal reserve board announced in its monthly review, have not been affected by the entrance of the United States into the war, although in every district there is going on a process of readjustment which is reflected in many lines. In no section of the country, the board finds, has there been industrial, financial or commercial distress because of the changes incidental to placing the country on a war footing.

Home Planning Contest.

The farm home contest under the direction of the Wisconsin college of agriculture open to the men and women of Wisconsin farms has been quite favorably received and several hundred plans have reached the college. There has been a slump, however, during the last few weeks, probably due to abnormal conditions. Interest in the contest is essential to its success. Surely every one of our readers has an idea of what the ideal farm home should be like. It costs little time and affords considerable satisfaction to map this out on the cross-section paper furnished to each contestant on request, together with directions for making the drawing. Sample drawings accompany the directions and these serve as a guide in penciling the sketches. Simply address the Farm Home Contest, College of Agriculture, Madison, and submit your ideas on the paper they send you. It costs nothing to enter and might result in a prize being awarded you. The first prize is $25, the second prize $10 and the third prize $5. A modern cook book will be given the six closest contestants. The last date of mailing your plan is June 1st. Competent judges will pass on the appropriateness of each plan for average Wisconsin conditions and on its convenience of arrangement and economy of construction.

Dependable Spark Plugs

Champion dependability is proverbial.

That is why virtually every motor fire wagon in the country is Champion equipped.

Champions are depended upon to get the nation's fire apparatus to the scenes of action.

And then *after they get there to pump the water.*

Champions *must* "produce"—and they do—hour after hour—under the most trying conditions.

And they will be just as dependable, just as efficient in *your* motor.

You can get Champions *everywhere.* Look for the name "CHAMPION" on the porcelain.

There is a Champion Spark Plug especially designed for every type of motor car, motorcycle, tractor, marine and stationary engine

Champion Spark Plug Company . . . Toledo, Ohio

Spring Sown Small Grains Are Up

Oats and Barley Are Growing in Spite of Cold Weather—Winter Wheat and Rye Show Good Stand—Live Stock Are Healthy.

WISCONSIN.

Barron County.—Rye, clover and alfalfa wintered in fine shape. Because of the high price of flour a few farmers are sowing spring wheat. Potatoes suitable for seed are selling at from $2.50 to $3.00 a bushel. Because of the scarcity of potato seed, the acreage will not be large. About one-half the oats are seeded. Cattle in general came through the winter in good shape. Eleven carloads of registered and high-grade Holstein cows and heifers have been shipped from this county since last November.—F. J. K.

Brown County.—Rye has never looked better. Clover is fine. There is very little wheat in this locality. Seeding is in progress. The acreage of potatoes will be cut down about one-third because seed is scarce and selling at $3.50 a bushel. The number of dairy cattle is normal and as a rule cows are in poor condition because of the scarcity of feed.—J. D. McAllister.

Buffalo County.—Clover and rye look fine. Seeding is well along. Weather is cold and unpleasant. Live stock are not doing well on account of the scarcity of feed. Seed potatoes are selling from $3.50 to $4.00 a bushel. Hogs are selling at $16 a hundred and in some cases even higher. Crop prospects in general are big.—John Wald.

Clark County.—Rye and clover came through the winter in fine condition and the prospects are for better crops than normal. Much rye was sown last fall. A few farmers are planning to sow spring wheat, but cold wet weather has prevented much sowing so far. A few fields of oats are in, but most of the farmers are unable to get the seed bed ready. Live stock came through the winter in good condition, despite the fact that feed was high-priced, especially hay. Few cattle have been sold. The prices of milk, butter and cheese encourage the increase of dairy herds. In March and April dairy cows sold at from $90 to $150 a head.—Louis Buddenhagen.

Crawford County.—Spring seeding is practically finished. Most of the oats are up and doing well. Recent rains have started the grass and although it has been quite cold, pastures are coming along as usual. Farmers are planning an increased acreage of all staple crops this year. Rye, wheat and meadows wintered well. The shortage of grain caused some live stock to come through the winter in rather poor condition. There is a shortage of brood sows and the effect of the winter is telling on the litters. Some farmers will put cattle on pasture in spite of the high cost of stock. Dairy cattle are in great demand—A. M. Laird.

Dunn County.—Winter wheat, clover, rye and alfalfa have come through the winter in fine condition. Considerable spring wheat is being sown, but the acreage will not be unusually large. Oat seeding is well under way. The season is cold and backward.—J. D. Millar.

Fond du Lac County.—Winter crops are in fine shape; alfalfa and clover are the best they have been for several years. Rye and winter wheat are good. Little spring wheat has been sown. Nearly all the oats and barley are in. Ground is in fine condition and the only hindrance is cold weather. Because of the great shortage of feed there are fewer dairy cattle in this vicinity than usual. The first county Holstein sale was a great success.—C. A. Williams.

Jackson County. — Clover came through the winter in fine shape and a good crop is promised. Alfalfa is also good. Winter wheat and rye are in splendid condition at this date. Pastures are late because of the unseasonably cold weather. Only about one-third of the oats are in. There will be an increased acreage of corn.—P. W. Jones.

Juneau County.—Grains and clover are the best they have been for five years. Spring grain sowing has been delayed by wet weather. About one-half the oat crop has been put in and some spring wheat. Live stock came through the winter in thin flesh, but have gained some recently. They are about normal in numbers. Dairying suffered to some extent during the past winter because of the severe cold.—C. A. Haskins.

Lafayette County.—Spring seeding is done. Very little wheat or rye is grown here. Early sown oats are coming up. Newly seeded clover and alfalfa wintered well, but many of the old clover meadows killed out. All stock wintered well. There are fewer brood sows than usual, but the spring litters are of good size. Pastures are backward and hay is getting scarce. More early potatoes have been planted than usual and general conditions are favorable.—W. J. Martin.

Langlade County.—Rye looks well. About one-fourth of the farmers will sow spring wheat. Some of it has already been put in. No oats have been sown and all seeding is backward because of the late season. Snow fell on the 25th and 29th of last month, which will delay seeding for several days. Clover fields look bare. Live stock are in fairly good condition, excepting cows. So far, about 90% of the lambs have been saved.—Chas. Lade.

Marquette County.—Rye is in fair condition. About 50% of the farmers have clover. Very little alfalfa is raised here. There was very little damage done from winterkilling. The oat crop is already in the ground. Dairying is fairly good. About 75% of the cattle are in thin flesh because of the scarcity of feed.—Emil Hein.

Polk County.—Rye seems to hold its own, although a smaller acreage was sown last fall than formerly. Clover winterkilled and only about 50% of it is left. Last year's seeding appears to be in fair condition. The small amount of alfalfa that is raised in this section is good. Spring seeding is nearly finished, but warmer weather is necessary to make a good crop. High prices of foodstuffs and live stock have caused a general selling off of grain and cattle.—E. H. Johnson.

Manitowoc County. — Rye, winter wheat and clover came through the winter in fine shape, but the recent late frosts and continued cold have done some damage to the winter wheat and clover. Very little spring seeding has been done on account of the heavy rains. Farmers are sowing more spring wheat than usual; the acreage of other grains will be increased also. Live stock are in good health. Feed is scarce and high priced. Farm labor is also very scarce.—Edwin S. Straka.

Trempealeau County.—Winter grain is good in this section—the best it has been in several years. Hardly any clover or alfalfa winterkilled. Much more spring wheat was sown this year than usual. Most of the grain is in and warmer weather is needed to start growth. Live stock show the lack of feed. Cattle are about as numerous as ever but calves are scarce.—J. W. Lowe.

Sawyer County.—Winter rye is growing slowly on account of continued cold and rain. Clover in some places seems winterkiled, but it is too early to make any accurate estimate. Cattle wintered rather poorly because of the shortage of hay. Movement is under way for farmers in this vicinity to raise enough spring wheat for their own needs. Most farmers will sow patches of from 1 to 5 acres of this grain.—J. Uhrenholdt.

St. Croix County.—Considerable wheat will be sown this spring and a larger acreage than last year may be expected. The acreage of rye is about the same as last year, but the crop is in better condition. The oat and barley crops will be normal. Clover came through the winter in fine condition. The number of dairy cattle will be increased this year and the number of beef cattle decreased. There are fewer brood sows than last year and the pig crop is smaller.—Stephen Everson.

Wood County.—A large acreage of rye was sown last fall and it wintered in good shape. Clover has been damaged about 25%. There is not much winter wheat raised here. Meadows and pastures are good so far but are not growing much this cold weather. A large acreage of oats and barley will be put in this spring. Cattle wintered well and are heathy but thin in flesh. There has been plenty of hay and straw, but prices for all feeds are high. Hogs are scarce and there have been few litters of young pigs. Young pigs are selling at from $10 to $14 a pair. The demand for milk cows is good.—P. B.

MINNESOTA.

Goodhue County.—Rainy cold weather has retarded spring work. Oats and spring wheat are nearly all seeded but farmers in this section are not inclined to plant much spring wheat. Winter wheat is not raised extensively, but the conditions of the few fields there are is about 100% normal. Barley, corn and potatoes will have about the same acreage as last year. Clover wintered well and promises a full crop. Rye is below the average because much of it failed to start last fall.—Otto Kolshorn.

In And Around Wisconsin.

A MEETING of the Equity Coöperative Exchange will be held at Fargo, N. D., May 23d and 24th. The purpose is to establish a minimum price for wheat and potatoes and also to take some action to discourage the trading in grain futures. It is expected the minimum price to be proposed would be $2 per bushel for wheat and $1 per bushel for potatoes.

THE price of milk in Madison will advance from 8 cents to 10 cents May 1st and the price of bread will be 10 and 15 cents per loaf, according to size. No more 5-cent loaves will be made. The 10-cent loaf will be reduced in weight from twenty ounces to sixteen ownces, so that consumers will pay 10 cents for what was called a 5-cent loaf a year ago.

SENATOR HANSON has before the general assembly a bill designated to cut down the number of road superintendents in Wisconsin from 16,000 to about 1,200. This bill provided for the election in April, 1917, of town superintendents of highways to serve two years. This bill would cut down as high as 200 or 300 road superintendents in some counties. It allows the supervisor in each town one man.

AT a recent mass meeting at Colfax, Dunn county, Wis., a committee was named to be known as the Colfax Labor Bureau. The purpose is to secure help for farmers. The committee is composed of E. B. Hill, George Vorland and Victor Noer. It is proposed that in time of seeding, haying, spraying potatoes or harvesting, temporary help will be furnished to farmers in need. This help will be chiefly from store and bank clerks who are familiar with farm work. Arrangements will be made for them to get away from their work in town and to close the stores and banks in the town for a day or parts of days as may become necessary. A number of merchants have expressed themselves as willing to close their stores and let their clerks go to the farms in the event of shortage of help.

ANOTHER advance has been offered in sugar beets. This time to $8 per ton. This advance was recently announced at Menomonee Falls where a number of sugar plants are located. It was claimed that sugar-beet acreage would be increased, provided help enough could be gotten to do the work. Every effort is being made to make arrangements to get help for the portions of the season when it is most needed.

F. H. SARGENT, COUNTY AGENT PRICE COUNTY, WIS.

THE Wisconsin Department of Agriculture has been making a splendid effort to put farmers, who want seed for planting, in touch with the sources of supply. C. P. Norgord, state agricultural commissioner, who is in charge of this work, has been kept busy handling the calls for potatoes and navy beans. More than 10,000 bushels of potatoes were bought by farmers through the department. The prices have been $3 a bushel for potatoes and $10 a bushel for beans. Although there will be a large demand for potatoes, farmers are urged to rely on a sufficient acreage of corn, beans and buckwheat rather than too many potatoes. Potatoes are a perishable crop and cannot be shipped as far or stored for as long time as cereals and beans, and, therefore, are less desirable for sending to armies across the ocean or for keeping until needed for home use.

MILK dealers in Madison have raised the price of milk to 10 cents a quart. Those who are delivering to local consumers in Janesville have reduced the price to 7 cents per quart. Inasmuch as the conditions are practically the same in both cities, it would seem the situation would bear investigation. It can't be claimed that feed is any higher priced in Madison than it is in Janesville. It has been the custom in previous years to reduce May 1st when spring pastures come on.

L. A. MARKHAM, JANESVILLE, NEW COUNTY AGENT IN ROCK COUNTY.

In Superior it was decided to simply leave the winter price and this has been the custom in most Wisconsin cities. We doubt if many of the farmers of Dane county who are furnishing the milk are getting an advance commensurate with the advance made by the Madison dairies.

FEDERAL DOUBLE CABLE BASE TIRES

Driving over rocky, rutty and uneven country roads is the hardest test you can give your tires.

The constant grind, twist and shock will soon show what they are made of.

Federal Tires are built with tough treads to better withstaand this wear and tear and give best possible traction.

They are safe tires, too. For in the base, next to the rim, are four strong steel cables which hold the tire securely to the rim under severest strains. Yet it slips off easily when necessary.

Made in white Rugged and black Traffik non-skid treads. Sold by leading dealers everywhere.

The Federal Rubber Company of Illinois (2)

Factories, Cudahy, Wis.

Manufacturers of Federal Automobile Tires, Tubes and Sundries: Motorcycle, Bicycle and Carriage Tires; Rubber Heels, Fibro Soles, Horse Shoe Pads, Rubber Matting and Mechanical Rubber Goods.

Potatoes For Everybody.

Choice seed for **10 hills** true **"Early Six Weeks,"** earliest potato on earth and of superlative quality. Also 315 varieties superior Vegetable and Flower seeds. All safely boxed and mailed postpaid for **two dimes**, or 24 cents in stamps. 30 hills potatoes and the seeds for 50 cents; 70 hills and seeds, $1. More, same rate. Address, **A. G. Cook (Potato Specialist) Hyde Park, N. Y.**—Adv.

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 12.

Milk Goats Economical Producers.

Four Goats Will Yield as Much as One Cow and Do It on About Half the Feed When Carefully Handled.

JUDGING from the number of letters we have received during the past six weeks, there is a growing interest in milk goats in sections where the land is rough and hilly and the forage scanty. If the right kind of milk goats were introduced in such sections we believe they would prove quite profitable provided the necessary labor for milking them could be obtained. The industry on any one farm would no doubt have to be limited to the labor the farmer could command within his own family, as there is so much prejudice against goats in this country that it would probably be impossible to hire labor that would be willing to milk them.

Milk goats are practically unknown to people in this country except to a small percentage of foreigners. The first importation of milk goats was made in 1893 by W. A. Shafer, of Ohio, who brought over four Toggenburg goats. In 1904 a much larger number was imported by F. S. Peer, of Ithica, N. Y. Mr. Peer brought representatives of two breeds—the Toggenburg and White Saanen, both being native to Switzerland, where about six milk breeds exist. The United States Department of Agriculture imported a few milk goats as early as 1888, of the Maltese breed, but the experiments with them proved a failure.

Milk goats are more prolific than Angoras or sheep. They usually produce twins and very frequently triplets. The period of gestation is only five months, so it is possible to breed them twice a year, but ordinarily they are bred three times in two years. They may be bred as yearlings. Their lactation period is from five to eight months and good milking strains produce up to six and eight quarts of milk a day. Such yields, however, are exceptional, but good average goats should yield two to four quarts a day. Like cows, goats vary a great deal in producing capacity, but they can be improved much faster than cows because of maturing a year sooner and because they produce three times as many young per year.

Goats, to do their best in the dairy line, need careful attention. One must not assume that they can live on tin cans and stand all sorts of hardships in the way of exposure. They are sensitive to wet and cold, and should be kept in well-lighted and well-ventilated stables liberally supplied with dry bedding and maintained in a sanitary condition. In Switzerland the goat is called the "poor man's cow" because it costs but a fraction of the price of a cow and can be maintained on a very small amount of land. On the other hand, the keeping of goats is by no means limited to the poor people in that country, because the milk of the goat is considered a delicacy and is prized more highly for all purposes than that of the cow.

One reason why goat's milk is so highly prized is because the goat is not very susceptible to tuberculosis. On this point a French author says that out of 130,000 goats and kids annually slaughtered in Paris not one case of tuberculosis has ever been found by the meat inspectors of that city. Since bovine tuberculosis is much more prevalent in Europe than in this country, and we have a good deal of it here, one can readily appreciate why goat's milk should be esteemed so highly over there.

Another thing in favor of the goat that appeals to many people who like to drink raw milk is its natural cleanliness. A goat refuses to eat any sort of food with the slightest taint. Its food must be clean in every sense of the word.

While it is self-evident that a goat to produce three quarts of milk a day must have plenty of good feed, yet it can find an abundance of feed where a cow could find none. Goats are excellent foragers, great hill climbers, and eat all sorts of vegetation that cows will not touch.

Following are some of the best-known breeds of milk goats: Toggenburg, White Saanen, Nubian, Maltese, New Mexican, Spanish Maltese, White Appenseller and Valaisan. The Toggenburg breed is probably the leading breed in this country. It is a Swiss goat; in fact, it is the oldest and the leading breed in Switzerland. It is very hardy, brownish in color with white ears and legs, and has two parallel white stripes on the head, running from the ears to the mouth. Toggenburg goats are heavy milk producers with well-developed udders. They stand confinement very well.

Goat's milk is not only especially well suited for children because of its freedom from germs of tuberculosis but it is also exceedingly well adapted for the manufacture of fancy cheese. The noted Roquefort cheese of France that now sells on our market for 85 cents a pound is made from a mixture of goat's and cow's milk.

Fixtures to Land.

When a farm or other real estate is sold and nothing is said in the contract about certain articles on it, which are commonly considered as personal property, it is often a problem to the parties just what constitutes in law fixtures that go to the purchaser with the real estate sold, as part of it. This should be fixed in the contract itself, but usually it is not, and the omission to do so leads to misunderstanding, contention and sometimes to vexatious lawsuits.

The law classifies all property into three divisions—real property, personal property and mixed property. Land is always real property and generally whatever is erected or growing upon land, or contained within it, or beneath its surface, constitutes a part of it in a legal sense, so that land includes not only the soil but everything attached to it permanently, whether attached by the course of nature, as trees, herbage and water, or by the hand of man, as buildings, walls and fences.

Fixtures mean things which in themselves are of a personal nature, but are so attached to the land that they belong to the landowner and cannot rightfully be taken away without his consent. Before such things are attached to the land they are of a personal nature, but when fixed or attached to the land they become fixtures thereto and part of it in a legal sense. In order for such things to become fixtures they must be fixed to the land in some degree greater or less. However, there are exceptions to this rule, as, for instance, keys, doors, windows and blinds, screens, bars, swinging gates, rails of a fence, door stones, loose lids of ovens and ash pits, fish in a pond, manure made on a farm by consumption of its products. Such things, though not actually fixed to the land, are fixtures and go with the land in a sale.

Three things are to be considered in determining whether or not a thing is a fixture: First, actual annexation to the land or to something appurtenant thereto; second, application to the use or purpose of that part of the land with which the thing is connected; third, the intention of the party attaching the thing to make it a permanent accession to the land. If such thing meets these three requirements it is a fixture to the land where it is attached.

In a sale of land, fixtures go with the land to the purchaser, unless they are expressly reserved. If the seller wishes to reserve fixtures from the sale he must do so in the deed. A verbal reservation is not sufficient. Generally the stationary engines and boilers fixed or set in foundations are part of the realty and pass by deed of the premises on which they are situated. As between seller and buyer, the following articles are deemed by law to be fixtures which pass by deed of the premises to the buyer, viz.: Trees cut and lying upon the ground and trees blown down by the wind, but not if such trees have been cut into logs or hewn or sawed into lumber; nursery trees planted by the landowner, water wheels and attachments, kettles in a dyeing factory, steam heating apparatus, including water pipes, boilers, radiators, etc.; bell hung in the cupola of a barn to be rung for farm purposes, church bell hung in the belfry, platform scales on a hay and grain farm, stanchions and tie chains for the cattle on a dairy farm.

The following articles are not deemed by law to be fixtures, as between seller and buyer, viz.: A steam engine set upon frames and portable, a planing machine and anvils resting on the ground, forge tools and a vice attachment screwed to a bench in a shop, grindstone in a movable frame, marble slabs laid upon brackets in a house, mirrors hooked but not otherwise fastened to the wall, telephone receiver and transmitter. These things remain the personal property of the seller of the land, unless the parties otherwise agree.

"In Union There is Strength"
A. Lincoln

FROM the beginning of the Firestone business, Lincoln's advice was heeded by its founder and present head, Mr. Firestone. He saw the power in singleness of purpose, and the roots of Firestone success are laid deep in organization.

The Firestone factory and sales forces everywhere work together to produce highest quality at lowest possible cost. They want Firestone Tires to be universal in use, to reach all the people. They know that motoring reaches its best possibilities when on every machine in all seasons, the equipment is—

Firestone
TIRES AND TUBES

Best from the mileage standpoint, toughness of tread and strength of body. And this toughness is combined with the resiliency demanded for easy riding and car protection.

With the true Abe Lincoln policy of "pull together," Firestone Branches and Dealers everywhere unite to give you maximum efficiency and economy of service.

Get Stumps Out The CHEAPEST Way

Explosives are recommended by the U. S. Department of Agriculture and by the leading State Experiment Stations as the best means of removing the stumps. Blast out your stumps—turn that idle land into money. You can do the work yourself easily and quickly with

Atlas Farm Powder
THE SAFEST EXPLOSIVE
The Original Farm Powder

Bore a hole, put in the charge, light a fuse, and the work is *done!* Atlas Farm Powder blows the stump entirely out of the ground, splitting it up so it can be handled easily. Any one may use it without experience by following directions. Atlas Farm Powder costs little and works wonders in clearing land of stumps and boulders, breaking up subsoil, tree planting, ditching and draining. It saves labor, time and money.

Mail Coupon for Free Book

Our big, illustrated book "Better Farming" tells how to improve the fertility of your farm by breaking up the subsoil—how to make ditches, clear land, make holes for tree planting. It tells how any farmer can save time and save money by using Atlas Farm Powder—The Safest Explosive.

Farm Power

WHEN an engine is bought for the farm it has nothing to do but work. Too many makers forget this and sell you an engine that would be more at home driving a pleasure car.

Nichols & Shepard don't forget what a farm engine is for—*just work*. For steam they build from 13-40 to 25-85 h. p., in five sizes and fifteen variations burning wood, coal or straw. For Oil-Gas from 25-50 to 35-70 h. p., full power on kerosene. All in the

Red River Special Line

Either kind will buckle down and *work*—not snort around and swell the expense account. Use your automobile when you want to burn up power for fun, but buy an engine that has no nonsense about it when it goes to work.

The final test on a farm engine is to hook it to a grain separator. That will require steady and reliable power to do paying work. Send to the Nichols & Shepard branch house that is nearest to you for a little paper that shows your own neighbors' letters on the farm power question. Any one of them will give you a money-saving tip. The handsome general catalog of the Red River Special Line will come with the paper if you ask for it.

Nichols & Shepard Co.
In Continuous Business Since 1848

Milking Strain of Short-horns.

Interesting Chapter From the Experience of the Littles Who Have Brought the Milking Short-horn Into Prominence in Rock County.

THE Littles are Scotch, and being Scotch, cattle raising comes as second nature to them. They belong to the clan who prefer Short-horns above all other breeds. Their success in this direction speaks clearly of the inherited adeptness in making the most of animal development.

It was way back in 1850 when John D. Little came to Rock county and settled on a homestead north of Evansville. Soon after him came the Short-horns, that were to make up the Champion Rose family, which strain is now predominant in the Little herd. The senior Little had four sons, three of whom, Joe, Harvey and Walter, are now carrying on the breeding work a few miles from the old homestead. Through years of hard work and careful mating, they have developed a strain of milking Short-horns which, in the estimation of their owners, fulfill quite satisfactorily the requirements of a milk and beef cow.

The herd was named after Mr. Champion, a breeder of the old country and from whose herd the first cow, Frolic, was purchased. The constant breeding of her offspring to bulls of the right stamp developed with the years the milking side of the herd, until today individuals have to their yearly credit records of 10,000 pounds of milk testing 4.10 per cent milk. There are seventy head in the herd today, twenty-seven of the cows milking.

The Littles know "where they are at" on the profit and loss side, for they have been weighing the milk and keeping tab on the herd for fifteen years. The cow that could not meet the standard and show a profit was weeded out of this herd long before the college men started their campaign of "weeding out the boarders." Of course, at first there was frequently a cow that could not pay her keep and to the shambles she went—fattened up nicely and sent over the block at a fancy price. It required no extra work and worry to dispose of her. Because of her breed she had the ability to put on flesh. That, in the opinion of Mr. Harvey Little, is the biggest and best point in favor of the milking Short-horn.

Harvey Little is the guiding spirit of the farm. The other boys are perfectly content to leave the administration of the farm finances, sale of cattle and disposal of the farm products to his care. When he decides to buy a new herd sire, or sell a serviceable bull from the herd or a matron or a calf, he tells them about it and it is all right. They have perfect confidence in the wisdom of his moves. Everything is discussed among the boys in a slow, even manner, with no one attempting to force his ideas upon the others. The mature cows on the Little place are of nearly perfect dual service type and are averaging 8,000 pounds of milk or better. They have the medium size that such animals must show, with good length and breadth without being massive like the special type beef animal, and over-refined in any particular like the strictly dairy breed. They have the wide forehead and the clean-cut head, free from throatiness. Their udders are generally large, extending forward and well up behind with evenly placed teats. The milk veins are long and branching with plenty of size. The cows move with the ease that is peculiar to their type, not sluggish and yet not nervous. The sires show the heavier form, with good length of body and with plenty of scale.

Better than nineteen matrons in the herd could have qualified during the last year for the "record of merit," which the Short-horn Association of America established a few years ago. This requires for the cow of five years of age or over to milk 8,000 pounds, yielding at least 300 pounds of butter fat in one year. The Little cows have done it for a number of years. Follow-

JANESVILLE ROSE 49TH—PRODUCED IN THREE YEARS AN AVERAGE OF 11,040 POUNDS OF MILK PER YEAR.

JANESVILLE ROSE 12TH, MOTHER OF JANESVILLE ROSE 49TH. SHE WAS FIFTEEN YEARS OLD WHEN SOLD AND BROUGHT A GOOD PRICE OVER THE SCALES.

ing are a few records of individual cows:

Cow	Lbs. milk in 12 months	Profit
Lilly Clay 4th	10,170	$94.00
Ida Fremont 5th	8,439	71.40
Janesville Rose 44th (seven months)	7,164	71.75
Janesville Rose 65th (4 year old)	8,256	57.28
Janesville Rose 70th	8,204	67.59
Janesville Rose 55th	8,419	70.54
Lady Mayflower 22d	9,090	74.57
Janesville Rose 5th (17 years old)	5,185	34.85
Lady Mayflower 27th (4 years old)	7,847	60.60
Janesville Rose 49th (3 years average)	10,877	

Lady Mayflower 27th and Lady Mayflower 22d, in spite of their big milk records, are of larger size than most of the cows in the herd. The first weighs 1,600 pounds at the present time and her stable mate 1,800 pounds. Cows like that, according to Mr. Little, are profitable at the pail and produce large, healthy calves. When their usefulness at the pail is ended they can easily be fattened up and sold to the packers, yielding a profit for the corn they have consumed.

BONNIE SCOTCHMAN BY SCOTCH SULTAN, OUT OF BONNIE BELLE MAHOE. OWNED BY THE LITTLE SHORT-HORN FARM.

Twenty years ago the Littles steered all their bull calves and sold them over the scales, but now they cannot raise enough to supply the demand which has sprung up throughout the country. The records go back to 1873, showing what happened to each animal and the profit the herd has made from year to year. Bull calves and heifers were sold at ridiculously low prices in those days, but as the herd improved and the demand for stock became better, prices advanced and nothing is sold to the butcher now prematurely. Bull calves bring a fine price from the breeders throughout the country and anything showing good returns at the pail is kept in the herd for breeding purpose and milk production.

The present herd header is Maud's Knight, whose dam is Rone's Maud, the first prize heifer at the International in 1914. Maud's Knight is by Robinhood, he by Beau of Glenside, he by Duke of Granville. Robinhood, the sire of Maud's Knight is out of Roan Lassie by Alice's Ensign, with eight heifers in the record of merit list, which specifies that a heifer must produce at least 5,000 pounds of milk within thirty months.

Two of the strong sires owned by the Little Bros. were the bulls, Roane Clay and Demonstrator 3d. Roane Clay was out of the famous Janesville Rose 12th, a cow bred on the Little farm. Rose 12th produced an average of fifty pounds of milk per day for seven days on home test, averaging 4.10 per cent butter fat. Her three last calves sold for $1,000. She was also the mother of Janesville Rose 49th, a cow that produced 11,040 pounds of milk in twelve months and finished her lactation period some months later with a final record of 12,548 pounds of milk. She dropped a nice calf a month after drying up and immediately started on a second record, yielding 11,582 pounds of milk in eleven months. She also made 10,000 pounds of milk in her third lactation period. Her three-year average is 10,877 pounds per year. She was sired by Demonstrator 3d.

On the dam side most of the females in the Little herd trace back to the famous cow, White Rose by Warrior. White Rose was imported by Governor Lloyd, of Maryland, in 1821, for dairy purposes.

In the nearly half century of time that has elapsed since the Little herd of Champion Rose Short-horns was started the constant aims of the elder Little and his boys have been to infuse the best blood of the Short-horn breed into the herd and breed, if possible, a true dual Short-horn cow for the general farmer. High production, easy feeding and good fleshing qualities have been the end in view. To attain the milk yield, none of the last two have been sacrificed. In the summer very little grain is fed and in winter silage and mixed feeds are rationed out according to production. The rule is "No work, no eat the dairy ration."

IDA FREMONT 55TH—RECORD 8,439 POUNDS, PROFIT $71.40. SOLD FOR $112 AFTER HER USEFULNESS AS A MILKER ENDED.

More Good Men For County Agents.

In releasing the senior and junior students of agriculture for work on the farm the college of agriculture of Wisconsin has done what was considered by them as the best work it could offer at this time. By their release, however, quite a few instructors at the college have also been released and are now available for county agents in the state. Under the new law twenty-five county agents are now permanently attached to various counties in the state. However, emergency agents have been asked by several counties. Under the law no funds are available for maintaining such agents in the agricultural work and their only opportunity of being supplied is in obtaining the services of the instructors that have now no classes to teach in the college. The activity of these men could be transferred to the counties, their pay coming as formerly from the university.

At least one such appointment has already been made in the case of Winnebago county, which has the services of Reid Murray for emergency agent for 1917. Mr. Murray has been active in the extension service of the agricultural college and has had many years of experience in an advisory capacity with the Northern Pacific Railway.

County agent work in Wisconsin has been highly satisfactory in the state and has been making progress during the last few years, whereas several other states have been going backward. Good men placed as emergency agents in the counties will establish still more firmly the county agent idea in Wisconsin.

Make the Roads Narrower.

To the Editor:—American farmers are at present being urged to cultivate every possible acre of ground this year, allowing not a foot to go to waste anywhere. This is rightly considered a patriotic duty of all farmers. Is it not then also a patriotic duty of those in a position to do so, editors, for instance, to start and push a campaign for legislation to cut down the legal width of our public highways? There is now more land wasted on the highways of the state than anywhere else. You yourself have surely often seen the wide strips of grass, weeds, etc., between the grades on our roads and the fences. On the heavily traveled roads between towns, where a good grade is necessary, they could not well be made much narrower, but they can be narrowed some. But on all the byroads and crossroads lie strips of idle waste land from six to ten feet wide on each side of the grade, and because the legal width of public highways was established when land was almost valueless it is now a misdemeanor for a farmer to move out his road fence to reclaim idle land. Now is a good time to get something started.

A Progressive Young Farmer.

Potatoes and Seeds Almost Given Away.

To Introduce—I will send seed for 10 big hills, true **"Early Six Weeks"**—by far the earliest and best table potato on earth—enormously productive and best keeper, also 10 varieties best "Butter" and "Head" lettuce, 5 varieties best Pop Corn, 300 varieties lovely, easy-growing flowers, and a valuable novelty. All mailed for **two dimes** or 24 cents in stamps. ☞All the seeds and 30 hills potatoes for 50 cents. Seeds and 70 hills $1. More at same rate. Order quick. Tell your friends. Address, **A. G. Cook (Potato Specialist) Hyde Park, N. Y.**—Adv.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Are Hawks a Menace to Poultrymen?

To the Editor:—There is much discussion as to whether hawks are a menace or a help to the farmer and poultryman, some claiming that they do more good than harm, others saying decidedly that they should be exterminated as rapidly as possible. I am led to conclude from my experience with them that the whole thing arises from an imperfect knowledge of the different kinds of hawks. I remember when I thought about the same thing, that no hawk should be allowed to live; and at that time I thought experience had taught me that they should not, but it was simply because I had not learned to distinguish one kind of hawk from another, nor did I seek this knowledge, either. A hawk was a hawk and that was all there was to it, and so say many today.

I admit there are some hawks that should be killed whenever possible. These are the pests, the hen hawk, the pigeon hawk and the chicken hawk. I well recall an experience my wife had with one of the chicken hawks. She was raising chickens for the early market that year and there was a pair of hawks that seemed determined to upset all her plans. I brought the chicken coops as near as possible to the back door, but these hawks would pounce down, grab a chicken and fly to a large tree not far from the house and eat it right before our eyes. Soon this happened two or three times a day and she soon saw her profits vanishing into the air, as it were, and although you may not believe it, it seemed as though these hawks knew when I was not around the house and always timed their visits to miss me.

At length she grew desperate and one day when they came twice in the forenoon she grabbed the gun that stood loaded handy and started out, but as soon as the hawk saw that it disappeared. When I came in I asked her what she intended doing, and, as she is not very large and as that gun sometimes had spells, I insisted in a very firm manner on her leaving it alone in the future. But a day or so afterwards Mr. Hawk came again when I was working near the house, and, being prepared for such an emergency, I followed him. He went to a marsh near by and I shot him as he circled over the place. Then mistrusting that there was a nest I hunted until I found it and killed the four young hawks which it contained. That ended our trouble with hawks for that summer.

There are, however, some hawks that I believe are really a benefit, as I have learned since then, but they often have to pay the penalty for belonging to a family with a bad name.

The marsh hawk feeds on mice, grasshoppers and other pests, although if driven to it from hunger he will also eat birds. The red-tailed and red-shouldered hawks are two that seldom, if ever, visit the poultry yard.

Should one of them get in the habit of visiting your poultry yard, then by all means make an end of him, for nothing that I know of is more exasperating than a hawk when he once gets a taste of young chicken, unless it may be a weasel or skunk.

Some hawks are exceedingly sharp and it takes quite cunning work to get them, and, in fact, I have spent hours in trying to get a good shot at one that was taking away the young chicks.

I have put up all kinds of things to scare them, with varying results. Sometimes a good scare will keep them away, and then again nothing short of a good load of shot will make a believer of them. Subscriber.

$9.25 World's Champion BUYS Belle City Incubator

140-Egg Size—Hot Water—Fibre Board, Double Walled—Self Regulated—Thermometer Holder—Deep Nursery, with $5.25 Hot Water 140-chick Brooder—both $13.50. WINTER-LAY ROSE COMB RED eggs: 24, $1.50; 48, $2.50; 120, $5.75. J. M. White, Twin Lakes, Minn.

Black Feathers in White Chickens.

To the Editor:—In answer to a subscriber's letter to the editor will say that a totally black feather in any section of a White Orpington, Rock or Wyandotte is a disqualification. While the bird might be a pure bred, it would be worthless as a breeder in a good pure-bred flock. Your neighbor who paid $8 for a cockerel that has a black feather in the tail got a $1 bird. If any judge scored a White Orpington that had any black feathers in it, and gave a score of 90 to 95, I must say he is anything but a competent judge.

As I stated previously, White Orpingtons should have white or pinkish legs and toes free from stubs of feathers on legs or between toes. They should be very deep in shape and the back of fair length, but not narrow. The legs should be reasonably short. Tail can be full, but not carried too high. One will find some White Orpingtons with bluish legs and toes. This is not a disqualification, but is a defect. Blue or lead color is very serious. Don't breed from such birds.

The size of Orpingtons is a point to be considered, they being the largest or one of the largest of clean-legged varieties, so small males are not the best to breed from for improvement of size. Brassiness is to be eluded as much as possible. It shows up in cock birds worse than cockerels, so care should be taken to use pure white cockerels, though we see some brassiness in the best of shows. Judge.

Feeding Young Chicks

To the Editor:—However well poultry growers succeed in getting numerous young chickens hatched out, the desire to get birds big enough to sell or for table use is only begun. It makes no difference whether young chickens, during the early springtime, are mothered in flocks by hens, or protected and started in brooders, the proper food and feeding must of necessity be the same. Not necessarily must the food be of certain kinds or mixtures, but whatever is used, known to be food, is beneficial alike to all.

It is wise to rather underfeed just a little than to feed too much. Like the farm stock, the young and growing chickens thrive and do best if allowed daily to get hungry for regular meals. The old way once practiced of feeding the young chickens corn meal dough only cannot any longer be recommended except on farms where no restrictions are put on hens with good flocks to range far out in adjacent fields and woodlands. In such cases many bugs, worms and insects are consumed and act as a balance to the food for promoting growth.

Even on the farms now, fowls, young and old, are not allowed to range as they did once. Hence, more attention must be given to the kind and variety of foods they are fed. Whatever the grain mixture, such as corn, wheat, buckwheat, sunflower seed, millet, etc., ground together, a complete ration is not formed without a little animal meat in the composition. Let the food be fed dry, but provide plenty of pure, fresh water—then see the chickens grow. W. A. G.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

SEEDS.

FREE SEED CORN, samples and circular. Northern home grown, hanger dried, heaviest yielding, early varieties. W. C. Bryant, Princeton, Illinois.

YELLOW Dent corn, 1914 tipped and tested, $6 bu.; 1916 not tipped or tested, $4 bu., f. o. b. Potosi. S. N. Bushnell, R. 4, Potosi, Wis.

GOLDEN Glow and Clark's Yellow Dent seed corn for sale. Wisconsin grown and fire dried. Burton Peck, Spring Green, Wisconsin.

BLACK Hills alfalfa seed, $6.00 per bu. For sample send stamp to Brookside Farm, Buffalo Gap, So. Dak.

SEED corn, Wisconsin No. 7 and Clark's Yellow Dent. Glenn Cass, Spring Green, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer quickly and honestly. FARM LANDS.

NORTH DAKOTA is essentially an agricultural state. In the past five years it ranked first in production of wheat twice, twice it was second and once third; always first in production of spring wheat; also flax, equaling production of all other states. Once it was first in barley, never below third; never below seventh in rye and oats. Has made great increase in corn and stock. You can still obtain home there without commission to us, while land is still cheap. Easy terms. Write AT ONCE, for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Building, Minneapolis, Minn.

ONLY $700 down. Dandy 40-acre farm in heart of prosperous dairy region, Polk county, Wis. Fine buildings worth over $2,000 (send for photo) and best of clay loam land with about half in field and balance mostly open pasture, all tillable. Splendid location only half mile consolidated school, creamery, store, 6 miles town over state road. Real snap at $3,400. W. M. Christensen, cashier, Luck, Wis.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, L and Department, Stanley, Wis.

FREE—We are interested in seeing the low priced farm lands around our home developed. If you are looking for land, just write me and say: "Without any cost to me, tell me how you got your farm home." Address Mrs. Lucy L. Ferguson, B-26, Cedarville, Marinette county, Wis.

THE number of fine farms in the partially settled upper Wisconsin counties will surprise you. It is a country of success, and land there will not long be cheap. State map and crop figures free. Wisconsin Advancement Association, 1590 First National Bank Bldg., Milwaukee, Wis.

FOR SALE—By owner, 168-acre farm, fine house and two fine barns, in best of condition, worth $6,000. Clay loam soil, 80 acres under plow, farm located about one-half mile from village of 1,200 people. Price $10,000. Brush-McWilliams Company, in Wis., Antigo, Wis.

SECURE war prices for farm products; buy a farm. Here are a few bargains: 85 acres, 80-acre clearing, buildings, $3,500. 80-acre fine farm, buildings, $3,500. 40-acre, good home, $2,000. 120-acre, good farm, $2,800. The E. L. C. Co., Dept. 10A, Merrill, Wis.

GOOD corn, clover and grain land; improved, partially improved, or unimproved, at prices ranging from $15 to $100 per acre; best of location and soil. Write us now. W. E. WEBSTER, Hudson, Wis.

GOOD 120 cheap. 5 acres plowed; good pasture; considerable timber left; lies rolling; nice lakes; 7-room house; log barn; 3 miles to station; $2,000, cash $900. The E. L. C. Co., 136-M, Dept. 10, Merrill, Wis.

UPPER WISCONSIN, clover belt, farmers grow rich; 40-80-acre tracts; mile station; good roads, schools, churches; $20-$30 acre, ¼ down, balance easy. R. J. Russell, La Crosse, Wis.

WISCONSIN—Large list improved farms, unimproved lands, 60 miles from twin cities, ideal dairy, clover belt, easy terms. Write for list. RIVARD, Turtle Lake, Wisconsin.

A BARGAIN—100 acres fine land, one-half mile from town. Situated in finest farming district in Michigan. Must be sold at once. J. Christiansen, Pontiac, Mich.

BIG bargain, 80-acre improved stock and dairy farm 2 miles from Athens, $55.00 per acre. Write for particulars. John Brann Lumber Co., Athens, Wis.

FOR SALE—Choice, well-located fruit ranches, Lake Shore drive, Berrien county. Address Schulz, St. Joseph, Mich.

Silverize Your Silage

for Better Fat Stock and Dairy Profits

CORN cut by Silver's "Ohio" Silo Filler makes better silage according to the records of "Ohio" users.

There's a difference in silage just as there is a difference in the machines that cut it. Some silage goes into the silo with long shreds and leaves which form air pockets and spoil the silage. Other silage is cut in uneven lengths—the sugar does not get out to properly act in the fermenting process. Silverized silage is cut in *short, even lengths*. The sugar juices around the joints of the cornstalks are *released*—the silage packs down air-tight in a homogeneous mass. Makes the *right* kind of food to bring *maximum milk yield* from dairy cows—or to put *weight* on fat stock.

Silver's "Ohio"

The Logical Silo Filler

"Ohio" cut silage is cut finer and more uniform than ordinary silage. Shorter lengths. Not just in spots but all the way from bottom to the top of the silo. The reason is, the knives hold their position. For example, if you set them at half inch, they cut half inch right along. Pressure of the material cannot spring them out of place. They are of the sturdy cylinder type, with bearings at *both* ends. Have accurate, patented adjustments for a quick, short, clean, shearing cut. The material is cut to a mold-proof semi-pulp—fine and free from "air pockets" and uncut leaves.

And this is but one of the many big features on Silver's "Ohio." Write and let us tell you about the others. About the new beater self-feed that saves a man's work at the feed table; the direct drive—drive pulley, knife cylinder and blower fan all on one shaft, reducing friction and saving power; the low-speed, explosion-proof blower fan; single lever control; bull-dog grip feed rollers, friction reverse and others.

Books Free

One is our catalog—tells about Silver construction and why Silver's "Ohio"—the pioneer—is the logical silo filler for the custom man or the man who does only his own work. The other is a booklet that shows in dollars and cents why it pays to "*Silverize your silage.*" Write today.

The Silver Mfg. Co.
Box 312
Salem Ohio

Silver's "Ohio" is made in seven sizes—fit any farm or purse. For 4 h. p. gas to big tractors. 40 to 300 tons a day. Special light draft models for 4 to 10 h. p. engine.

"Modern Silage Methods" 264 pages—sent for 25c—coin or stamps

When writing to advertisers kindly mention The Wisconsin Farmer.

Dairymen and the War Crisis.

Dairymen have an important part to play in the present world conflict. Our army which our country shall raise and the armies of our allies must be fed. The people of our country and the hundreds of millions of population in the countries of our allies must be fed. This throws a tremendous responsibility upon America and upon American farmers. Our success in this warfare, and our success means the triumph of civilization, will depend no less upon the farms of our country than it will depend upon our armies. It is now admitted by military authorities that the war in Europe has ceased to be a conflict of arms, awful as the carnage may be, and has become a war of food and food supplies. The army that is well fed longest is the one to win.

It is the food situation and none other that has drawn America into the conflict. Germany has sought by submarine warfare to cut off the foreign food supply from England and to thus reduce her energy and her fighting power. We must draw a lesson even from Germany in that the food problem is one of the greatest, if not the very greatest, to confront any nation in time of war.

The industries of our country are being mobilized in support of war measures. Account is being taken of all manufacturing plants in order that their value in manufacturing war supplies may be determined. In no less a sense must our fields, our farms and our shipping facilities be organized for their proper place in support of our country and our civilization. One of the greatest sayings in the history of warfare is that of Nelson, the great British admiral, when he said to his crews about to enter battle, "England expects every man to do his duty." Today the call goes out through our land that "Uncle Sam expects every man to do his duty." This need not be at the battle's front. It doubtless is as great heroism for the man or boy in his uniform of white who shall take care of the dairy herd as it is for his brother to wear the khaki or blue of our fighting army. The milking machine will doubtless play as useful a part as shall the rapid-firing gun. The silo has its place in this war just as surely as have forts and ramparts. The auto truck on the dairy farm is of as great importance to our nation as is the truck that does duty just behind the trenches.

Dairying is an intensive line of agriculture. The present demand is for extreme utilization of all our agricultural possibilities. Dairymen are already doing this as are no others unless it be truck growers and orchardists. Our dairy farms are producing a high proportion of human food per acre. Dairymen can exert a very wholesome influence upon all farm operations. The silo is one great means of utilizing our principal crop. Dairymen have found the silo to be a means of increasing the live stock capacity of the farm. Scarcely one farm in ten throughout our country has a silo. Here is a wonderful opportunity for dairymen to do their country and their fellow farmers a great service in extending the use of silos. They can lend encouragement and give the benefit of their experience and later will be able to contribute the use of engine or filler. The by-products of the dairy are to be utilized as never before. In this crisis the nation cannot afford for a single gallon of skim milk or buttermilk to be wasted. They are too valuable as chicken feed or as pig feed or the skim milk can be made into cottage cheese as is already being done in many dairies.

Dairy organizations can do their part and doubtless they will render great service in continuing their campaign of education in the value of dairy products as food. Previously this promotion may have appeared the least bit selfish. Now it is a patriotic duty because greater use of dairy products means greater national efficiency. Doubtless our government will make pointed suggestions concerning many of our crops and products. In all which may affect the dairymen or dairy interests the organization will doubtless lend all possible assistance in putting such suggestions into practice.

Dairymen are to be called upon to face one of the most severe problems that will confront any class of men. That is the labor problem. The only positive thing that can be said concerning it is that dairymen cannot and will not flinch. They will meet this problem and they will solve it. Already dairy farms are short of help. A call for enlistment will remove many of the young men from the barns and farms and milk rooms. City routes will suddenly be left without drivers. The use of more labor-saving machinery will help. One active young dairyman has said, "If I can secure a two-row corn cultivator and a small tractor I shall be helped wonderfully and shall be able to pull through regardless of what happens." There are school boys and college boys and men from institutions that deal in luxuries whose services will be offered to farmers. These will be honest and industrious and anxious to do some patriotic service. Some of these will doubtless be able to render valuable service to dairymen. The American milkmaid will cease to be a myth and will become a reality. The young lady who serves her country through giving assistance to the dairy deserves recognition equal to that given her sister who may be in the Red Cross service. It is great and good to provide food for those at the front in order that they may do credit to the nation and in order that those on the firing line may be full of vigor that they may recover from injury or shall be able to resist disease. Doubtless this is as great a service as it is to render assistance after disease or injury has happened. British girls are milking cows, they are feeding calves, they are delivering milk. No less patriotic and no less willing are our American girls. They will be on duty just as soon as the demand shall appear.

There may come to the dairymen times of trial. We must remember that great truth was spoken by Garfield when he said, "At the head of all the sciences and arts, at the head of civilization and progress stands—not militarism, the science that kills, not commerce, the art that accumulates wealth—but agriculture, the mother of all industry and the maintainer of human life." The thought of this quotation is virtually in the heart and mind of every dairyman. In the strength of his ideals and conviction he will render great and important service to his nation.

Raising Colt on Cow's Milk.

To the Editor:—I noticed an inquiry as to how to feed and raise a colt on cow's milk. We raised one with good success. The mother died the same day the colt was born, but by the advice of two different veterinarians we raised it with little trouble after the first three weeks.

We fed it one quart of cow's milk, warm, half water. Start with a quart at first, with a beaten egg in it once a day to keep the bowels in good condition. Feed this every three or four hours, from early in the morning until midnight or later. Then after two weeks add the feed a little at a time, and two eggs a day, until the feed is enough to satisfy the hunger. We fed out of a round wash basin like feeding a calf and the colt learned to drink as easily as a calf and drank the same way. Later we put a box on a post with oats in it and the colt ate whatever it wanted to and did fine. It is now a strong yearling.

THE INDIANA SILO

Fifty thousand are now in use on the finest farms in America.

If you are going to buy a silo—this satisfactory service rendered everywhere—should be of special interest to you.

The cost of all materials is advancing like the price of wheat and corn.

Why not save money by contracting for your silo now. It undoubtedly will cost you more next spring or summer.

Let us send you our proposition—to contract now for your silo and deliver it later.

We still have openings for a limited number of farmer agents.

INDIANA SILO CO.

618 Union Building, ANDERSON, INDIANA
618 Silo Bldg., KANSAS CITY, MO.
618 Indiana Building DES MOINES, IOWA
618 Live Stock Exch. Bldg., FT. WORTH, TEXAS

Turn Your Old Bags Into Cash

Before doing anything with your empty bags, be sure to get our proposition. We pay top notch prices and stand shipping expenses. Write at once and let us know what you have on hand.

FEDERAL BAG CO.
2327 Morgan St., St. Louis, Mo.

Winner Opening Silo Roof

Gives 6 to 9 feet more silo space and 15 to 40 tons more silage worth up to $160 each year. Delivered prices quoted. Special discount to Early buyers. Act quickly. Write to day.

Silo Specialty Mfg. Co.,
245 Market Bank Bldg.
Minneapolis, Minn.

When writing to advertisers kindly mention The Wisconsin Farmer.

Cow-Testing Reports.

Alban and New Hope Cow-Testing Association.

To the Editor:—Naturally people do not expect to find high-producing cows in a section of the country which was formerly devoted to logging, and where the hum of the sawmill can still be heard, but some very excellent results have been obtained by the first year of testing in the Alban and New Hope Association. Among some of the things that have been accomplished during the year are the following:

Nine bred for production sires have been placed at the head of as many herds some of these sires replaced scrub sires which were being used before the testing association was started. By having the heifers tested every month these farmers realized that in order to increase the production through breeding, they must use something better than the ordinary scrub sire that one can buy in the stockyards.

Fifty-two unprofitable cows were sent to the stockyards where they ought to have been a long time ago. The chances are that over half of these cows would have been occupying their stalls and giving the farmer the pleasure of feeding them just for the sake of their company, and also being a detriment to him in the way of pulling down his herd by breeding from these cows, if they had not been tested.

The champion cow for the year is a grade Guernsey owned by W. J. Wrolstad, Northland. Below are the figures for the five highest producing cows:

Owner and breed	Lbs. milk	Lbs. B. fat	Yearly value of product
M. J. Wrolstad			
Gr. Guern.	10,772	543.5	$194.94
A. L. Brekke			
Gr. Hol.	11,166	490.5	176.32
C. E. Erickson			
Gr. Guern.	9,616	467.0	162.36
G. J. Olstad			
N. Hol.	12,442	460.1	166.76
C. O. Wogsland			
Gr. Guern.	8,048	442.7	164.79

It cost $62.62 per cow for feed during the year, and they returned a profit of $112.35, and still some farmers will tell you that it does not pay to feed.

The three highest averaging herds for the year are owned by the following men:

Owner and breed	No. of cows	Lbs. of milk per cow	Lbs. of fat per cow
A. L. Brekke			
Holstein	4	8,835	351.5
C. O. Wogsland			
Guernsey	6	6,448	341.4
M. J. Wrolstad			
Guernsey	17	6,401	331.1

The value of product per cow was $123.62. Cost of feed per cow was $47.45. Profit per cow, $67.17. Another example of whether it pays to have good cows or not.

Each of the 218 cows that completed the full year's test produced 276.7 pounds of butter fat per cow, which is about 100 pounds more than the state average. They made a profit of $54.44 over the cost of feed.

Mr. Anton Brekke says: "If I had been a member of an association before, I would not have sold as many of my good cows as I have done. I have also taken more interest in dairying since I became a member of the association."

Mr. O. A. Colrud says: "I have increased my cream checks $250 in one year for my twelve cows."

Mr. M. J. Wrolstad says: "I paid my testing dues by taking better care of my cows during the dry spell this summer."

Ole P. Dobbie says: "It pays to get rid of my poor cows and to take good care of the high-producing ones."

I could quote statements like this from almost all the members.

M. E. Smith,

C. F. Wehrwein,
Official Tester Columbus Association, Portage county, Wis.

Medford Association.

To the Editor:—The scarcity of good roughage and the high price of feeds are still problems here, but our cows are returning good profits. The best cow for March was a grade Holstein owned by August J. Brandt, who has a herd of sixteen Holsteins of which he may well be proud. Mr. Brandt can show records from his cows for a period of three years or more. Our forty-five-pound list for the thirty-day period ending April 15th, is as follows:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat
Mrs Mat Heinz & Sons

KALAMAZOO SILOS

Will Solve Your Silo Problems

They're built to meet the exacting farmers' needs and are the best in design, material and workmanship—combining every desirable feature a silo should have and embodying the "know how" acquired through more than twenty years experience in silo building.

Glazed Tile Silos

This construction is fire-proof, frost-proof, storm-proof, decay-proof, vermin-proof. Galvanized reinforcing. Requires no paint, no upkeep expense or repairs. First cost is the last cost—a written guarantee goes with every one.

Wood•Stave Silos

Your choice of four time-defying woods. The Kalamazoo is the only factory where this outfit is manufactured complete from the raw material to the finished product. Our silos are quickly and easily erected by inexperienced home labor.

All Kalamazoo Silos are made with Galvanized Steel Door Frames, continuous doors, forming safe ladder entire height of silo.

Write today for our free descriptive booklet, and early sales plan.

KALAMAZOO TANK & SILO COMPANY, Dept. 211 Kalamazoo, Mich.

How to Erect A Wood Tire Silo

Bolt tire to concrete base. Set the 2 x 4 spacers on lower tire and toe-nail. Place second tire on spacers and toe-nail. Repeat until framework is done. Nail on outer covering of spruce—then inner lining of California redwood.

You then have a **storm-proof, frost-proof, mould-proof** silo without hoops or guy wires—one that will not swell, shrink or decay—a different, *patented* silo that gives you the best possible service and at a reasonable cost. Write for our FREE silo folder and learn more about its construction and advantages.

WOOD TIRE SILO CO. 7 Clark Street Sheboygan Falls, Wis.

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat at over $2 per bu. offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops

You can get a Homestead of 160 a. FREE

and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed Farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

There is now an extra demand for farm laborers to replace the many young men who have volunteered for service in war. The government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada. or

Geo. L. Moss Resigns.

To the Editor:—Enclosed find my last report of forty-five-pound cows in the Waupaca and Butternut Ridge Association. In March, sixty-six cows produced forty pounds of butter fat or over. The association has been reorganized into two associations, with Mr. Arnin Isker tester for one and Mr. Martin Frihart, tester for the other. Each association will have about 400 cows. I have resigned from the work here. Attached is the forty-five-pound list for March:

State Cow-Testing Report.

To the Editor:—Upper Wisconsin carried off the honors in March for the highest butter fat producing cow. Mrs. F. D. Scott, of the Rice and Cedar Lake Association, has a five-year-old registered Guernsey which produced 88.8 pounds of fat during the month. The highest herd average for the month was that of Martiny & Son, Baraboo Association, with 58.2 pounds of fat per cow. This is also a Guernsey herd. New associations have recently been organized at Granton, Cedar Grove, Horicon, Neenah, Butternut Ridge, Seymour and Algoma. In March a number of unprofitable cows were sold to advantage and seventeen registered bulls were bought by members of the associations which reported. March reports (summarized) to Mr. Noel Negley, of the Wisconsin Dairymen's Association, follow:

Association	Tester	No. of 40-lb. cows	Fat production of high cow	Breed	Owner
Winnebago county	A. R. House	68	70.3	Gr. G.	J. W. Thrall
Empire	R. H. Monroe	66	63.1	Gr. H.	Wm. Kirschenstein

PATRIOTISM DEMANDS

That All Butter-Fat Waste Be Stopped

President Wilson's powerful appeal for the conservation of the nation's resources is still ringing in our ears. "The supreme need," he says, "of our own nation, and of the nations with which we are co-operating, is an abundance of supplies, and especially of food stuffs;" and again, "Upon the farmers of this country, therefore, in large measure rests the fate of the war and the fate of the nation."

Wasteful methods must be abolished. Every device that makes for the saving of time and labor on the farm must be utilized. Every plan that makes for the conservation of our food products must have the farmer's hearty co-operation.

And nowhere is there greater opportunity than in the production of dairy products, particularly butter-fat.

"Fats, fats, fats, more fats," that is the demand of the warring nations in Europe. The men who toil and the men in the trenches must have fats. They are the fuel that the human machine must have.

And no fat is so palatable or so easily assimilated as butter.

When it was simply a question of the farmer's own loss of profit, the tremendous waste of butter-fat on American farms was bad enough, but under present conditions such waste is nothing short of criminal.

And it is wholly unnecessary.

It is conservatively estimated that about a million cow owners in the United States are still skimming milk by some wasteful "gravity" method.

At an average of four cows to the farm, and an average waste of thirty-five to fifty pounds of butter-fat per cow, all of which could be saved by the use of a De Laval Cream Separator, this alone represents an annual waste of at least 140,000,000 pounds of butter-fat.

Then there are, perhaps, a million inferior or half-worn-out separators in use whose owners could save fifteen to twenty pounds of butter-fat per cow per year by replacing such machines with New De Lavals; and this represents another waste of at least 60,000,000 pounds of butter-fat annually.

Also there is the loss of time and labor that a De Laval would save and which could be better devoted to other productive work on the farm. This waste is hard to compute, but it is almost as important as the loss of butter-fat.

These are startling statements, but any dairy or creamery authority will agree that these estimates of waste are really very conservative.

Shall this tremendous waste continue? Will the loyal American farmer permit such waste when he appreciates the duty that is laid upon him to conserve the one article of food that above all others is necessary to the life and health and energy of the men who serve the nation in the field, the factory, the mine—and soon in the trenches?

We have always had an abiding faith in the American farmer, and we believe that if he is made to appreciate the full purport of the President's appeal to him, the appeal will not be in vain; and when he further appreciates what the De Laval can do to save the butter-fat which is now being wasted, and that his patriotic duty demands that such waste be stopped—NOW—our plants will not be big enough to take care of one-half the demand for De Laval Cream Separators.

THE DE LAVAL SEPARATOR COMPANY

Bottles Useful in Canning Operations.

When the canning season opens there is going to be a shortage of both glass and tin containers. They will be high in price and in some instances it will be absolutely impossible to obtain them. Also, there is going to be more demand for jars and cans this year than ever before because the amount of fruit and vegetables to be preserved will exceed any previous year by thousands upon thousands of quarts.

What are the home canners going to do about it? They are going to save bottles of every description. They are going to hoard every glass, crockery or porcelain container that comes into the house. The small-necked bottles are going to be used by the home canners for fruit juices and the wide-necked ones, such as screw-top candy, cream or spice jars, are going to be used for putting up fruits, preserves, jellies and jams. If the product is such that it must be sealed as in the regular fruit jar, a cork and paraffin or sealing wax turns the trick. Jellies, jams and preserves need nothing more than a coating of paraffin over the top, and a paper cap.

By using bottles for all products that can be so preserved, the supply of regular glass jars and tin cans will be saved for vegetables, meats, soups and such products as must be cared for in the usual way.

Large tin canisters or tin cans with removable covers, provided the body of the container is air and water tight, will be found useful in canning certain fruit products. These cans may be sterilized and their covers hermetically sealed in place with solder or wax.

Then there is another way to conserve the supply of cans and jars and that is by drying and evaporating such products as apples, pumpkins, squash, beans and peas. Every preserving jar in every home in the land should this year be filled, but they should be packed only with such products as cannot be preserved in any other way.

It would be a good idea for every housewife to take the time now to look over her supply of cans and jars to determine how many she will need to take care of her canning operations, how many she can save by drying and evaporating certain products, and then set to work to gather together such containers as are here suggested—makeshifts, to be sure, but satisfactory nevertheless. Be a patriotic canner—mobilize the bottles and let nothing go to waste for lack of something in which to preserve it. The world needs every ounce of food that can be produced and American farm women have a wonderful opportunity to help.

Feeding the Child During Second Year.

Much of the illness and suffering among babies commonly attributed to the "second summer" or to teething is actually due to errors in feeding. The baby's delicate digestive mechanism, accustomed to dealing only with milk, cannot all at once undertake the task of adjustment to a varied diet of solid foods, but must be strengthened by the gradual addition of new foods until the organs are trained to more complicated operations. The safe rule for feeding the baby is to add but one new food at a time to his dietary; to watch carefully the effect of each one and to withdraw it and return to the simpler diet at the first sign of trouble. These rules are particularly important in summer, when a baby is more readily upset.

The following list shows the day's meals for a baby in his second year:

7 a. m. Milk, zwieback, toast or dried bread.
9 a. m. Orange juice.
10 a. m. Cereal, cup of milk.
2 p. m. Broth, meat, vegetable, stale bread, baked apple.
6 p. m. Cereal, milk, toast or bread.
10 p. m. milk (may be omitted.)

At this time the baby should be taking about one quart of milk in twenty-four hours; part of this may be poured over the cereal.

Oatmeal should be cooked three hours, with a little salt in the water. It should be served without sugar or with a very little only. The lighter cereals should be cooked at least an hour.

Bread for young children must have been thoroughly baked and should be quite dry when used, that is, at least two days old. Tender toast is made by cutting thin slices from such a loaf and allowing them to dry still more, then toasting them to a delicate brown over a quick fire. Toast thus made is crisp all the way through and may be used in many ways. Many children will like to eat it broken into bits in broth or milk. Hot breads and biscuits, griddle cakes and muffins are not suitable for young children.

The child may have a small portion of baked apple or prunes once a day in addition to his morning feeding of orange juice. The apple should be baked very tender and all the skin, seeds and hard spots should be removed. Prunes should be very carefully washed, soaked all night, then cooked until very tender with very little sugar. A small portion of the strained pulp may be given instead of apple, and the juice may be used also.

The child may have about a tablespoonful of scraped meat, or soft-boiled or coddled egg once a day. Beef, broiled, boiled or roasted, the tender part of a lamb chop or the delicate meat of chicken or fish may be used. All meat should be scraped or minced very fine, as no child of this age can be trusted to chew it properly.

A small portion of some properly cooked green vegetable like spinach or tender string beans may be given. Such vegetables should be fresh. They should be cooked, then drained and mashed or strained through a colander.—[Children's Bureau, United States Department of Labor.

THE YOUNG FOLKS.

Teddy Watches the Chickens.

Dear Young Folks:—I am eight years old and live on a farm. I have a pet dog. He is white with a black head and tail. He is a fox terrier and his name is Teddy. He always chases away the hawks and crows. As soon as the chickens make a fuss he is up and running after whatever is bothering them.

One of the young folks asked this riddle: What goes around the house and around the house and hides behind the door at night? It is a broom.

—Edith.

Wants to Make a Kite.

Dear Young Folks:—I should like to join your circle. I am a boy ten years old. I weigh about seventy-four pounds. I live on a forty-acre farm three miles from town. I have to walk a mile to school and am in the fourth grade.

Have any of the young folks ever had any experience in making a kite? I have tried it many times, but never succeeded and I should like very much to know how to make one.

—Wallace.

Tatting in Blue and White.

The tatting edge here shown is made of No. 30 blue thread on shuttle and the same number white thread on spool.

Tie the ends and with white thread chain 6 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 6 d. s., 1 p., 6 d. s.; with blue thread 6 d. s., 1 p., 3 d. s., 5 p. separated by 2 d. s., 3 d. s., 1 p., 6 d. s.; close. Second blue ring 6 d. s., join to picot of 1st ring, 3 d. s., 5 p. separated by 3 d. s., 3 d. s., 1 p., 6 d. s.; close. Third blue ring, 6 d. s., join to 2d ring, 3 d. s., 1 p., 5 p. separated by 2 d. s., 1 p., 6 d. s.; close. That makes clover leaf.

PRETTY TATTING FOR WAISTS, AND DRESSES

Now with white thread, 6 d. s., join to white p. up the stem, 6 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 6 d. s., 1 p., 6 d. s., join to middle p. of last blue ring, 6 d. s., 1 p., 6 d. s.

With blue thread make small ring of 5 d. s., join to p. on 2d blue ring of clover leaf, 5 d. s., 1 p., 5 d. s.; close. With white thread make 6 d. s.

The lower clover leaf is just the same as the upper one, only join first leaf to the little blue ring. After clover leaf is completed take white thread, 6 d. s. Make another little blue ring, then 5 d. s., join to last p. of blue leaf, 5 d. s., 1 p., 5 d. s.; close. With white thread 6 d. s., join to white p. coming down, 6 d. s., 1 p., 6 d. s., join to white p., 6 d. s., 1 p., 2 d. s., 1 p., 2 d. s., 1 p., 6 d. s., 1 p., 6 d. s., and you are ready for the upper clover leaf.

In blue and white or lavender and white this is beautiful on fancy waists, tub silks or gingham dresses for school.

Style Built Into Foot-Schulze Footwear

Foot-Schulze & Co. Saint Paul — THIS MARK ON THE SOLE DENOTES QUALITY

It is possible to make good-looking shoes that will stay good-looking, if the maker is willing to go to the trouble. To last, good looks must be *built* in.

That's the way *Foot-Schulze Footwear* is made. That's why these excellent shoes hold their pleasing appearance so much longer than shoes often do.

Foot-Schulze Footwear is made by the most skillful shoemakers in a wonderfully convenient factory under conditions as favorable and comfortable as could be desired. No wonder *Foot-Schulze Footwear* is *so much better!*

There's a Foot-Schulze dealer in your town who will give you the best of service. He's easy to find and a good man to know.

Foot-Schulze & Company

Saint Paul

Better Shoes

For farm wear. Double-tanned by a special process. "Farm Wear" Shoes resist barnyard acids. Another reason they outwear other work shoes—they are made of solid leather. They also fit better and feel better—because they are made over full standard lasts with extra wide treads. Four heights—6 to 16 inches. Black and Chocolate.

If your dealer doesn't handle "Farm Wear" Shoes, tell us his name and we will arrange it so you can examine a pair.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 850 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to WISCONSIN FARMER, Madison, Wisconsin.

2083—A practical undergarment. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3½ yards of 36-inch material for a 36-inch size.

2075—A becoming model for the growing girl. Pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 will require 2⅞ yards of 44-inch material.

2088—A pretty dress for party or best wear. Pattern is cut in 4 sizes; 6, 8, 10 and 12 years. It requires 4¼ yards of 36-inch material for an 8 year size.

Waist 2097-Skirt 2076—A pleasing combination. The waist is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure, and requires 3⅛ yards of 36-inch material for a 36-inch size. Skirt is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 3⅝ yards of 44-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

1704—Girls' dress with sleeve in either of two lengths. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3½ yards of 36-inch material for an 8-year size.

2073—Children's rompers with sleeve in either of two lengths. Pattern is cut in 4 sizes: 2, 3, 4 and 5 years. It requires 2¾ yards of 36-inch material for a 4-year size.

1695—A dainty frock for mother's girl. Pattern is cut in 4 sizes: 2, 3, 4 and 5 years. It requires 2 yards of 36-inch material for a 4-year size.

1791—Ladies' house dress. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 5½ yards of 44-inch material for a 36-inch size.

Blouse 1766-Skirt 1765—A splendid suit for sports wear. Both patterns are cut in 4 sizes: 14, 16, 18 and 20 years. To make the suit of one material will require 8⅛ yards of 36-inch material for a 16-year size. Two separate patterns, 10 cents for each pattern.

1739—Ladies' dress in surplice style. The overwaist is fitted on a lining which may be omitted if not desired. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 7 yards of 36-inch material for a 36-inch size.

1735—Men's negligee or outing shirt, with sleeve in either of two lengths, and collar rolled high or low. Pattern is cut in 7 sizes: 38, 40, 42, 44, 46, 48 and 50 inches breast measure, neck measure to correspond in sizes, 15, 15½, 16, 16½, 17, 17½ and 18. It requires 3½ yards of 36-inch material for a 17-inch neck size.

2078—A simple apron model. Pattern is cut in 4 sizes: Small for 32 and 34 inches bust measure, medium for 36 and 38 inches bust measure, large for 40 and 42 inches bust measure, and extra large for 44 and 46 inches bust measure. It requires for a medium size 4¾ yards of 36-inch material.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for May 13, 1917.

Jesus the True Vine.

LESSON TEXT—John 15:1-13.

GOLDEN TEXT—I am the vine, ye are the branches.—John 15:5.

This lesson chronologically follows that of last Sunday. Christ had risen with his disciples from the supper table (14:31), and the remainder of his discourse may have occurred in an upper room, or in the courtyard of the house before they left the city, or on the way to the garden of Gethsemane.

I. The Abiding Life (vv. 1:4). Under the figure of the vine Jesus teaches spiritual truth by natural analogy. The vine is composed of roots, stem, branches, tendrils, and fruit. There is no separate life: The branches are one with the vine. Christ is the head of that body which is the church to its least member. The life lived by the Christian is Christ's life humanized, the purpose of which is fruit bearing. Discipline is in order to fruitfulness. "He (My Father, the vine-dresser) cuts away any branch on me which is not bearing fruit, and cleans every branch which does bear fruit, to make it bear richer fruit" (Moffat's translation). Paul tells us that "no chastening for the present seemeth to be joyous, but grievous: nevertheless, afterward it yieldeth the peaceable fruit of righteousness unto them which are exercised thereby." The Word is the cleansing agent (17:17). Verse four suggests a double abiding—we in him, and he in us— the branch depending upon the vine for life, and the vine depending upon the branch for fruit. Jesus had just been talking about his approaching death, and his disciples were full of anxiety. He tells them not to be troubled, and by this figure assures them that, though he would leave them, he would still be joined with them. Although they had been made clean, they are taught that the only way to keep clean is by "abiding" which is to be continued through the eternal spirit after his decease and ascent to the Father. "It is given to us to hold fellowship with both the root that twines itself about the cross and the tendrils which stretch upward to glory."—A. J. Gordon.

II. The Fruitful Life (vv. 5-8). If we abide in him we will bring forth much fruit. Note the progression; "fruit," "more fruit," "much fruit." If the branch does not bear fruit it is fit only for fuel (Isa. 27:11). "If ye abide in me, and my words abide in you, ye shall ask what ye will, and it shall be done unto you" (v. 7). Our first fruit is to glorify God (v. 8.) The vine does not consume the fruit which it produces, though it does exist for its production, thus glorifying God through its fruit-bearing function. The Bible uses many figures to illustrate the intimate relationship between root and fruit. "Without me," emphasizes Christ, "ye can do nothing." The "word" of verse three is equivalent to the word "I" of verse four. "Now ye are clean through the word which I have spoken unto you" (v. 3.) Our fruit bearing is for God's glory because it is an expression of his grace and power, and it is made possible through our identification with his dear son. Our fruitfulness attests our Christian character. We have not yet attained perfection in our conduct, but we are making progress.

III. The Permanent Life (vv. 9-13). "Fruit," "more fruit," "much fruit." Even as the life of Christ has increasingly manifested itself through the ages, so our individual lives are to increase in the fruitfulness which assimilates them to his character and expresses his graces. As the Father has loved Him, so has He loved us, and this love he communicates to those who abide in him. The evidence of our abiding is manifested by our joy in keeping his commandments, just as he delighted in keeping his father's commandments. Obedience and joy are correlated terms. The fuller the obedience the greater the joy. Bushnell said: "Heaven is nothing but the joy of a perfectly harmoninzed being filled with God and His love." Instead of minute, detailed instructions regarding their conduct, the disciples are here presented with love, the governing principle. Love was to be the one sufficient impulse for both divine and human relationships.

Three things are mentioned as resulting from the abiding life; power to bear much fruit; transform lives and change circumstances through answered prayer; and fullness of joy—a "joy unspeakable and full of glory." The world with its poor counterfeits has nothing like it to give, but all of these gifts are contingent upon our "abiding" in Christ, the source of every blessing. The personal pronoun suggests peculiarly intimate relationships: "My Father," (vv. 1, 8, 10); "My love," (v. 9); "My disciples," (v. 8); "My commandments," (v. 10); "My joy," (v. 11).

Meeting the Universal Need

In the high passes of the mountains, accessible only to the daring pioneer and the sure-footed burro, there are telephone linemen stringing wires.

Across bays or rivers a flat-bottomed boat is used to unreel the message-bearing cables and lay them beneath the water.

Over the sand-blown, treeless desert a truck train plows its way with telephone material and supplies.

Through dense forests linemen are felling trees and cutting a swath for lines of wire-laden poles.

Vast telephone extensions are progressing simultaneously in the waste places as well as in the thickly populated communities.

These betterments are ceaseless and they are voluntary, requiring the expenditure of almost superhuman imagination, energy and large capital.

In the Bell organization, besides the army of manual toilers, there is an army of experts, including almost the entire gamut of human labors. These men, scientific and practical, are constantly inventing means for supplying the numberless new demands of the telephone using public.

Reduces Bursal Enlargements, Thickened, Swollen Tissues, Curbs, Filled Tendons, Soreness from Bruises or Strains; stops Spavin Lameness, allays pain. Does not blister, remove the hair or lay up the horse. $2.00 a bottle at druggists or delivered. Book 1 M free.

ABSORBINE, JR., for mankind—an antiseptic liniment for bruises, cuts, wounds, strains, painful, swollen veins or glands. It heals and soothes. $1.00 a bottle at druggists or postpaid. Will tell you more if you write. Made in the U. S. A. by

W. F. YOUNG, P.D.F., 101 Temple St., Springfield, Mass.

OREGON & CALIFORNIA RAILROAD CO grant lands. Title to same revested in United States by act of Congress dated June 9, 1916. Two million three hundred thousand acres to be opened for homesteads and sale. Timber and agricultural lands. Containing some of best land left in United States. Now is the opportune time. Large sectional map showing lands and description of soil, climate, rainfall, elevations, etc. Postpaid one dollar. Grant Lands Locating Co., Box 610, Portland, Oregon.

A SMALL farm in California will make you more money with less work. You will live longer and better. Delightful climate. Rich soil. Low prices. Easy terms. Sure profits. Hospitable neighbors. Good roads, schools, churches. Write for our San Joaquin Valley illus. folders, free. C. L. Seagraves, Ind. Com'r, A.T.& S.F.Ry., 1959 Ry. Ex., Chicago.

FOR SALE—163-acre farm in Jackson county, Wis. Fine location on main road between two towns, 3½ miles to each. This is a bargain for anyone wanting a good stock farm at the right price. $3,000 will handle it. If interested, write for further particulars, W. C. Davis, Alma Center, Wis.

GOLDEN Glow seed corn, kiln dried, 98% germination; $3 per bu. Order from producer. Get descriptions. Riley Martiny & Son, Baraboo, Wis.

FARMS wanted—Wanted to hear from owner of farm or fruit ranch for sale. O. O. Mattson, 2954 Cedar Ave., Minneapolis, Minn.

A Beautiful Flag Button Free

Never have the Stars and Stripes been so popular as now. Everyone is wearing a flag on the lapel of the coat or pinned to the waist. If you haven't a flag to wear you should get one without delay. Here is your chance to get this beautiful flag button (size of cut) in colors. All you have to do is to enclose a two-cent stamp in your letter to pay postage and cost of mailing. We will also send you a certificate of entry in our grand contest for a $395 Saxon Automobile.

Saxon Car Given Away

A new auto contest is just starting. At the close of the contest a $395 Saxon Roadster will be given to the winner. In case of a tie a Saxon car will be given to each person so tied. Send at once and you can be entered in this great contest. Full particulars and one of the flag buttons by return mail.

Saxon Editor, 925 Popular Bldg., Des Moines, Iowa

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

Ailing Animals.

Use of Teat Dilator.

I have a cow that is a hard milker and I want to use a teat dilator on her. Is it necessary to call a veterinarian for this or can one do it himself?

One can pass the teat dilator with safety if the end of the teat is first cleansed and the dilator dropped in boiling water shortly before using.

Hand-Feeding Colt.

I would like to know the right method of raising a young colt by hand-feeding it. One of my neighbors is going to give me one as soon as the mare foals and I would like to know whether to use nipple or not.

This can be done by use of the nipple and bottle until the colt learns to drink. Use whole cow's milk diluted with water, and a little sugar added. At first feed often and in small quantities; later you may feed less often and in larger quantities.

Vicious Habit.

I have a pair of pet rabbits and one of them ate her litter. They were her first litter. I feed her bread, meal, etc. Can you advise me what to do for her?

This is no doubt a vicious habit which is often seen in mothers in various species of animals. It is one usually hard to overcome unless the animal just naturally outgrows it. If this occurs again, would dispose of her. Give her a good run and a variety of good, wholesome food.

Abortion in Sows.

I am having trouble with my sows aborting from three to six weeks after breeding. There is a white substance comes from them and in three or four days they take the boar again, and, as before stated, in three weeks the same thing takes place again. They are about a year old, large for their age and in fine condition. They are not too fat and have been properly fed for breeding purposes. I had two cows which aborted in an adjoining lot, but the sows were never in that lot. Do you think they could contract the disease from them under those conditions?

It is not thought that abortion is transmissible from cattle to swine and neither has it been proven that abortion in sows is of an infectious nature. It might pay you to fatten these sows out and sell them, then clean and disinfect premises and get new stock. Be careful in your feeding to not feed frozen and moldy feed.

Stricture of Milk Ducts.

I would like to know what is the matter with my Holstein cow. She has been fresh fifteen days and her two hind teats were entirely closed. I took a wire and opened them up, but every time I milk her I have to open them, and they only give about one-fourth of a stream—not enough for the calf to suck till she is dry. It seems as though there are little bunches right where the teats open into the bag. Her bag is soft and there is no swelling. This is her second calf. What causes this and what can I do for her? I saw a veterinarian about it and he said he would not operate and remove these bunches while she is in full milk.

Your cow's teats are strictured and your veterinarian is right in not operating while she is in full flow of milk. You can best use a German silver milk tube in each teat. This will drain off the milk and help open the duct. You should sterilize the tubes before using by boiling, and also see that the teats are clean. You can get the tubes of your druggist.

On Math Michels' Farm.

(Continued from page 1.)

heifers receive somewhat less. Two boys, Hiram and Harvey, help with the farm work and have an interest in the splendid herd that Mr. Michels has built up. The boys are given an opportunity to purchase stock when it is young and the father helps them in the sale of the developed animals. There are about forty animals in the herd at the present time headed by Sunburst King Masher, who is by King Masher's King and out of Yeksa Sunburst, with a record of 11,800 pounds of milk and 581 pounds of fat. A half brother to Sunburst King Masher out of Yeksa Sunburst sold for $500. Most of the cows are of the Yeksa strain of Guernseys and have inherited the habit of producing in true Yeksa fashion.

Mr. Michels is greatly in favor of home improvements and has in his home the modern conveniences so desirable on any farm. A water system, the result of intelligent harnessing of a spring on a hill somewhat higher than the home, supplies running water to any part of the farm. This spring was pressed into service by inverting a concrete box over it and banking the sides with clay so as to prevent surface water from entering the box. A pipe carries the water from this box to the house and barn. A furnace heats every corner of the large house.

At the rear entrance of the house is a room where the men can wash before entering the dining room which leads off from it. The kitchen is to one side, which makes it possible for the housewife to work without being disturbed by a procession of men filing through there at each meal time. Upstairs a bathroom gives the family the same conveniences enjoyed in the city, hot and cold water being available all the time. Mr. Michels has constructed a refrigerator which can be readily copied by anyone who has the advantage of running water. It is simply a box built like a refrigerator which has on the inside several coils of pipe through which the cool spring water is constantly flowing on its way to supply the tank in the milk house. This refrigerator has been in service for a number of years and has not needed any attention whatsoever except an occasional cleaning out by the housewife. The butter and milk stay cold during the hottest weather by this arrangement.

Light for the house is supplied by an acetylene gas tank situated in the woodhouse a few feet from the dwelling. This gas can also be used for cooking purposes during the hot season of the year.

A baby tractor was purchased for the farm during 1916, and has already made a good showing by its plowing and service for heavy work. Formerly five horses toiled long and hard in turning over the hilly fields on the Guernsey Farm—for there are a few hills in Fond du Lac county. Now the tractor puffs steadily along under its load and is ever willing as long as the fuel holds out. It has already played a big part in preparing the fields this spring. Every operation except the seeding on twenty acres that have been planted so far has been done by the tractor.

Mr. Michels' close association with the dairymen of Wisconsin has made him popular and well known throughout the state. He has done considerable institute work, and is always in favor of better things in farming as long as they are sane and reasonable. He is president of the Wisconsin Dairymen's Association, an organization which has been behind every big move in Wisconsin and has done much towards better farming in the state.

YOU'RE beginning to notice a lot more information about tobacco, since W-B CUT Chewing got into full swing. People don't hanker after size any more. They want *tobacco satisfaction*—and excess sweetening can't cover up what's not there. The good tobacco taste of W-B is winning friends pretty much wherever you go nowdays—just rich, sappy leaf, *shredded* and *seasoned with a bit of salt* to bring out the fine tobacco flavor.

PREVENT DEATH AMONG CALVES

Caffatone—the Dairyman's preventative and remedy for scours, positively stops scours in calves and colts inside of 3 hours without binding. Caffatone is harmless—given to weak and delicate animals. Many calves are born with scours. Protect yourself now—have Caffatone on hand—often there is no time to get Caffatone after scours is discovered although we send immediately by parcel post. Caffatone keeps indefinitely—packed in gelatine case 15 tablets to box together with full directions. Results are guaranteed—Caffatone given widest endorsement by users—colleges. Money back guarantee card accompanies all orders—tear out ad—send us name of druggist—Pin $1.00 bill to letter. Protect your calves by mailing order today.

CAFFATONE REMEDY CO.
300 E. Main St., Platteville, Wis.

UPPER WISCONSIN

THE following reports, covering 1916 business of a number of Polk county, Wisconsin creameries, will be of interest:

Milltown Co-operative Creamery.

Total lbs. butter made in 1916...	421855
Average net price paid patrons per lb. butter fat.....	37.40
Average test of cream.....	25.46
Average per cent overrun.....	22.31
Average cost of making butter per lb.	1¾

Eureka Co-operative Creamery.

Total lbs. butter made.....	133020
Average net price paid per lb. butter fat	36.70
Average test of cream.....	28
Average overrun	20.40
Cost of making butter per lb....	2.09

Garfield Co-operative Creamery.

Total lbs. butter made.....	163619
Average net price paid per lb. butter fat	36.62
Average test of cream.....	24.2
Average overrun	23.5
Cost of making not reported.	

Bone Lake Co-operative Creamery.

Total lbs. butter made.....	158741
Average net price paid per lb. for butter fat	36.50
Average test of cream.....	25.67
Average overrun	20.78
Cost of making not reported.	

Lykens Co-operative Creamery.

Total lbs. butter made.....	116095
Average net price paid per lb. butter fat	36.27
Average test of cream.....	27.93
Average overrun	25.71
Cost of making butter per lb....	2.37

Volga Co-operative Creamery.

Total pounds butter fat.....	106715
Average net price paid per lb. butter fat	36.14
Average test of cream.....	29.22
Average overrun	22.59
Cost of making butter per lb....	2.10

Apple River Co-operative Creamery at Range.

Total lbs. butter made.....	199509
Average net price paid per lb. butter fat	35.62
Average test of cream.....	25.60
Average overrun	24.31
Cost of making not reported.	

Amery Co-operative Creamery.

Total pounds butter made.....	257905
Average net price paid per lb. butter fat	35.32
Average test of cream.....	26.57
Average overrun	21.31
Cost of making not reported.	

Milltown creamery paid the highest price, 37.40, and Volga creamery had the highest average test of cream, 29.22.

In comparing Polk county creameries with the largest co-operative creamery in Wisconsin, and perhaps in the world, we find that Polk county prices compare very favorably.

Barron Co-operative Creamery.

Total lbs. butter made.....	1,389,820
Average net price paid.....	36.15
Average test of cream.....	27.58
Average overrun	21.1
Cost of making butter per lb..	1.13

C. B. POST, Agricultural Agent of Ashland county, says there will be an unusual amount of clearing this year. Farmers have contracted for an extra amount of dynamite.

IT IS stated in some Upper Wisconsin counties where farmers are holding potatoes for higher prices that the assessors will render a statement for personal property taxation on this stock. Under this plan, which is to be carried out in some Upper Wisconsin counties the farmers will discover that their personal property assessment has been largely increased.

R. A. KOLB, county agricultural agent in Taylor county, warns against seed potato agents who are attempting to dispose of seed stock grown in other states, especially in the east. Last fall an agent canvassed Taylor county, selling New York potatoes as high as $6.00 per bushel for seed. Mr. Kolb says local potatoes are just as good and can be bought at about half price.

AS a member of the Oneida Council of Defense, Mr. W. D. Juday, county agricultural agent of Oneida county, has issued the following general recommendations:

That each grower, as far as possible, put in a series of diversified food crops.

Peas and beans are food high in protein and make good substitutes for the high priced meats. Both crops can be grown well here. The peas can be planted any time after May 1st, as they are not affected by light frosts. Beans are more tender and should not be planted until May 20th to 25th.

Carrots are a splendid vegetable and no family should raise less than enough to keep them over the winter. They are hardy, can be sown most any time after May 1st and yield big returns.

We can grow no surer crop than rutabagas. They can be sown any time up to last of June. It is best to sow this crop in drills.

An early variety of sweet corn (Golden Bantam preferred) is also an excellent food crop to grow. We can can or dry the surplus and thus be assured of another excellent winter vegetable.

The cost of seed per acre is an important item in the growing of each of the above-named crops and their food value is great.

Some of our best soil this year should be planted to the potato. This will be our cash crop and we should aim to make our yields per acre large so as to materially cut down cost of production. We know we can get good crops with potatoes. Put the crop in early and tend it better than you ever have before.

Buckwheat is a good cash crop as well as food crop to sow on land we have brought under cultivation late.

TO THE Editor:—An instance where it pays to raise roots is in the case of new settlers in northern Wisconsin. Ordinarily one-fourth to one-half of an acre of roots can be made to supply succulent feeds that shall be required for three or four cows and be the means of doubling their flow of milk through the winter months. However, after a settler has ten acres or more cleared, he should still continue to grow some roots, but he should depend upon silage to furnish the greater part of his succulent feed.

In an experimental way we have grown many varieties of roots, including rutabagas, turnips, stock carrots, and many kinds of mangel-wurzels, and have come to the conclusion that for our purpose the rutabagas are the most profitable to grow. First, because we can get a better stand; second, because it is less work to care for them, and third, because the quantity and quality of feed secured from a given acre of land is as great or greater than with any other variety of roots.

Rutabagas will grow on any soil that will grow corn or potatoes. As with other crops, so with roots, the better the land as to fertility and tilth the greater the crop we have a right to expect.

To grow a big crop of roots, put your land in the same condition that you would to grow a big crop of corn or potatoes. We have grown our rutabagas at distances varying from two to three feet apart in the row, and have come to the conclusion that where the land is in the best condition as feed can be grown at three feet or closer together and with less work.

We thin out to about ten inches in the row. If the soil is not in the best condition, they may be planted closer together, but on richer soil they must have more room to grow and develop.

Rutabagas can be sown any time up to the first of July, and in northern Wisconsin they will continue to grow until stopped by cold weather. I believe the largest yield is obtained by sowing them early, say the 20th of May, or thereabouts, as that gives them a long time to grow.

The crop may be cultivated and thinned out any time after the plants are an inch or two above the ground. After this they should be cultivated and hand hoed often enough to break up a dust mulch and to keep down the weeds. This cultivation will have to be kept up only until the leaves are large enough to completely shade the ground, when the crop will usually take care of itself. In this way in an ordinary season, rutabagas can be made to yield one thousand bushels per acre in the clay loam sections of northern Wisconsin.

The past season it cost us about five cents per bushel to grow and store them away in root cellars.

Some people object to raising roots because it requires too much work to grow them. From the standpoint of area, it does unquestionably take more work to grow roots than other stock feeds, not so, however, when taken from the standpoint of value. We can grow an acre of grain much cheaper and with less labor than is required to grow an acre of roots, but it costs more to raise a given value of grain products than it does the same value of roots.

Edward Nordman.
Chairman Agricultural Committee, State Council of Defense.

TO the Editor:—One of the greatest grains of the world is not looked after by the state nor its people and even our farm papers seem to have forgotten it. We have such a grain which can be cultivated and only one little handful is plenty for a meal. Now is the time to see that this grain is harvested and the thousands of acres that go to waste in northern Minnesota and northern Wisconsin would feed thousands, even millions, if it was looked after. It could be cultivated and harvested by machinery. The red man is the only man that has enjoyed this great grain, namely, wild rice. Now, Mr. Editor, please take this up with our experiment workers.

Geo. P. LeaQuee.
Bayfield county, Wis.

Our Farm Help Column

The Wisconsin Farmer is indebted to the Chicago Daily News for a number of names of men and women who want jobs on farms in Wisconsin. The names furnished us by the News are included in the list given below. The Chicago Daily News is coöperating with the government in running a farm labor recruiting station. We suggest that any of our readers who are in need of farm help, and who do not find listed below any offer which is interesting, write to the Farm Labor Recruiting Department, care Chicago Daily News, Chicago, Illinois. The Daily News is making no charge for its services.

HELP WANTED.

Sam Christy, Clarksville, Iowa, wants man for eight months.

Anton Flidr, Pocahontas, Iowa, wants man for remainder of season, $45 a month.

L. A. Dagett, Eldon, Iowa. Wants experienced steady man. Good wages.

FARM JOBS WANTED.

Chas. Le Dates, Walworth, Wis. Married, six boys eig htto twenty. Wants job on grain or dairy farm for self and three boys, fourteen, seventeen and twenty years old. Wages for self and wife $60.

John Koran, 507 So. 8th Ave., Maywood, Ill. Married, two children. Will work alone or with wife as cook or housekeeper.

W. K. Webster, 1150 West Washington St., Chicago, Ill. Married, one child. Age twenty-three. Wages $35 or $40 per month.

G. W. Chambers, 3159 Warren Ave., Chicago, Ill. Experience in general farming. Married, no children.

James McDowell, 2713 Madison St., Chicago, Ill. General farm hand, seven years' experience.

Cyril J. Ford, 731 Buckingham Place, Chicago, Ill. Single. General farm work. No experience. Age sixteen. Wages $25 per month.

Edgar Lowrey, 3733 Osgood St., Chicago, Ill. Age sixteen. No experience. Wages $25 per month.

R. Oefstedal, 4835 West Rice St., Chicago, Ill. Age twenty. Six years' experience on cattle farm.

Arthur Benson, 6946 Union Ave., Chicago, Ill. Age seventeen. Experience on truck farm. Wants job on grain farm. Wages $30 per month.

Philip M. Langerman, 6159 Evans Street, Chicago. Age nineteen. No experience. Wages $20 to $25 a month.

James Andronier, 757 West Madison St., Chicago, Ill. Age twenty-four. Greek nationality. Experienced. Wages $35 to $45 per month.

D. W. Baxter, 320 Humphrey Ave., Oak Park, Ill. Age eighteen. Some experience. Wages $20 to $25 per month.

Norman L. Smith, 1002 No. Dearborn St., Chicago. No experience. Does not want to go more than seventy-five miles from Chicago.

Frank J. Batista, 2539, So. Hamline Ave., Chicago, Ill. Single. Age twenty-two. Experienced. Wants work on dairy or grain farm.

Frank Colby, 2132 West Lake St., Chicago, Ill. Experienced. Will work on shares.

John Robinson, 3135 Archer Ave., Chicago, Ill. Experienced. Age fifty-one.

James Colas, 14 East Ontario St., Chicago, Ill. Experienced. Married. No children. Wife also wants general housework.

Edward M. Milward, 2938 No. Clark St., Chicago, Ill. Age twenty-two. Experienced general and dairy farming.

Bremmer Wattian, 3134 West 15th St., Chicago, Ill. Jewish. Age seventeen. Experienced, $30 per month.

J. D. Batson, 2304 Keeler Ave., Chicago, Ill. Age thirty-two. Married, three children. Experienced in general farm work.

Michael Linnane, 6316 Dorchester Ave., Chicago, Ill. Age twenty-five. Fifteen years' experience general farm work. Wages $40 per month. Wants all year job.

Frank Kengen, 109 West Elm St., Chicago, Ill. Single, three years' experience general farm and carpenter work. Wages $45 per month.

Frank Waldo, 2422 West Lake St., Chicago, Ill. Married. Two children. American. Thirty-five years old. Experienced. Wants work for self and wife in Waupaca county, Wis. Prefers tenant house and $50 per month salary.

A. T. Hougard, 1423 E. 69th Place, Chicago, Ill. Dane. Age twenty-six. Experience in general farm work. Wants job for self and wife, $50 per month for the two. Wife cannot do milking.

Mrs. Bertha Hodgkins, Sparta, Wis. Care of State school. Wants job for her son seventeen years old, experienced in all kinds of farm work. Also wants place for herself and boy, fifteen years of age, also with farm experience.

George C. Little, 624 No. 56th Ave., West Duluth, Minn.

Ray Wilson, 4515 Page Boulevard, St. Louis, Mo. Experienced at farming and as machinist.

Efforts to attract labor from the United States to Canadian farms under promises of high wages and other inducements by means of advertisements inserted in newspapers in this country have been ordered discontinued. Sir George Foster, acting prime minister of Canada, has telegraphed Senator Kellogg, of Minnesota, to this effect in response to a message from the senator pointing out that thousands of laborers have gone to Canada as a result of the propaganda conducted in this country.

An earnest appeal has been made by the Kansas City Star for the preservation of one of the most beautiful of wild flowers, the columbine, particularly along tourist routes. This appeal will find sympathetic support everywhere throughout the states in which the columbine is a natural annual, but it should be broadened to include all wild flowering plants that are needlessly, and often wantonly, pulled up by the roots. The conservation of wild flowers is a patriotic duty.

The Tractor To Buy

EAGLE

YOU want a tractor that not only gives you dependable traction, but belt power for your silo filling, threshing, etc. The Eagle is an all-round engine, as well as tractor. Has the famous two-cylinder engine with valve-in-head motor. The outgrowth of years' experience in motor and tractor manufacturing. Runs as well on **kerosene** as gasoline. Ideal for medium-sized farms. Simple in construction; all parts easily accessible. Easy to operate. 8-16 H. P.; 12-22 H. P.; 16-30 H. P. Sold under an absolute guarantee. For complete details send for our descriptive catalog today.

EAGLE MFG. CO. 740 Winnebago St., APPLETON, WIS.

INSTALL YOUR FURNACE NOW

Every person expecting to install a heating plant this year should ORDER AT ONCE.

Owing to the difficulty in securing material, and in transportation, it may be very difficult to secure a furnace late in the season. We bought a large stock of material last season, and we are prepared to furnish one of the very best heating plants at lower prices than can be made at the present price of material.

Greatest Potato Offer.

Don't miss the wonderful extra-early **"Six Weeks Potatoes."** None on earth can compare. Now is your time. I will send true seed for 10 big hills and add 50 cents worth of the finest vegetable and flower seeds to introduce, all for **two dimes** or 24 cents in stamps. 30 hills and the seeds for 50 cents; 70 hills and seeds, $1. More, same rate. Don't delay. Please tell everybody. **A. G. Cook (Potato Specialist) Hyde Park, N. Y.**—Adv.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Jersey Dispersion.

R. J. LINSCOTT will make a dispersion sale of his Jersey herd May 31st at Holton, Kan. This herd is headed by two of the leading Jersey bulls of the West, Jacoba Irene's Premier and Gamboa's Knight. There will be about 60 head of cows and heifers in milk or springing, and about 45 head of heifers and calves and 20 bulls, making 125 head. This is a dispersion sale of the largest and oldest herd of registered Jerseys in Kansas. There will be many register of merit cows, and everything will carry close up the blood of the most noted register of merit and prize winners—many close relations of world champion butter test cows. The sale will be featured by the blood of the world's champion long-distance dairy cow, Jacoba Irene. This cow held the world's official butter record for eight years, her dam has made three world's records since she was 15 years old—737 pounds butter in one year on official test when 18 years 11 months old at end of test. Jacoba Irene left two sons—one was sold in 1909 for $5,000 and is now held above price, nor can money buy one of his daughters of his owner; the other son is senior herd bull in the Linscott herd and he (Jacoba Irene's Premier 80234) will be offered in this dispersal, along with his sons and daughters and about 30 cows in calf to him—the chance to get the blood of the world's champion butter cows close up. The illustrated, historical catalog will be sent upon application. Address R. J. Linscott, Holton, Kan.—Adv.

Pig Reports Remain About the Same.

SINCE last report we have received eight more letters from breeders in reply to our letter asking for reports on their pig crop. The first 185 sows that we have a report on farrowed an average of eight pigs to the litter, saving six of this number. In this report 91 sows farrowed 753 pigs, a little over eight to the litter, and they have saved 581 or 6.4 pigs to the litter. The two reports are about the same. In all we have heard from 23 herds and it looks like six pigs would about be the average of the spring pig crop. During the next two or three months the representatives of The Wisconsin Farmer will see most of the pure-bred herds in the state and we will try to keep you posted as to what your fellow breeder is doing and the pigs that he has. Every spring you read about the "best bunch I or he ever raised" or some pig that "will be hard to beat at the fall fairs" or "the best pigs I ever saw," so unless there is some special feature about a litter we will not "rave" about the pigs yet. We all know that a few months will make a great difference, and we will not attempt to pick the future winners among the spring pigs. We will try to give you the information about the various herds that we think you would like to know, so follow the field notes of The Wisconsin Farmer.—Adv.

Some Good Chesters.

WE recently saw a nice bunch of Chester White pigs at Art G. Hoskins, Dodgeville, Wis. This is one of the younger breeders of the state, though his father had been breeding Chesters for several years. Hoskins hasn't the biggest herd, but he is a good feeder and brings his pigs along in a thrifty growing condition. He has an excellent February litter, nine raised and these are weaned and ready to ship and the man that gets a boar or gilt from this litter will be pleased with his purchase. They are sired by Paddy 2d, he by a son of Schoolmaster. Six sows are raising 47 pigs and these are all for sale to be shipped June 1st. Get your order in early, for good Chesters are in demand and these are good. Will have more to say about this herd later. Mr. Hoskins also has milking Short-horns headed by a son of Roan Clay, out of Janesville Rose 5th, that gave 8,609 pounds of milk when 15 years old. He is siring a fine uniform lot of calves. Don't overlook the Chesters. Mention this paper.—Adv.

Prichard & Sons' Have Good Stallion Sale.

W. E. PRICHARD & SONS, Ottawa, Ill., write: "We are writing to say that we are now practically sold out of Percheron stallions. We have only one coming three year old left to sell, and he is a right good dark gray, with lots of bone, style and substance. The last sale we made was to J. Crouch & Son, Lafayette, Ill., who took the good, big, upstanding, dark gray, Louvois, coming three years old. They bought him strictly for a show horse, and he certainly looks as though he ought to make good. We have never seen a colt improve faster than he has in the last six weeks. He stands up big, has a splendid head and neck, great quarters and deep body and stands on feet, pasterns and legs that we think are faultless. Besides this he can go one and move like a cyclone. If he goes on well until next fall the boys that meet him will know that they have been to a horse show."—Adv.

Offering Short-horns.

WE recently spent the day with P. N. Collins, River Falls, Wis., and saw the Short-horns he has for sale. Just at this time he has a few young bulls, red, from heavy-milking dams that he is offering at conservative prices. He also has a few heifers that he will sell. The heifers are a nice, typey bunch and any man wanting a few heifers of this breed should investigate this lot. Get your order in early and when writing please mntion The Wisconsin Farmer.—Adv.

Avoid Contagious Diseases.

ANYBODY who stops to think about it must come to the conclusion that the use of a good disinfectant where animals are kept is well-nigh impossible. Animal thrift can only follow animal health. There are germs of disease that affect animals just the same as germs of disease affecting the human family. Animals need to be kept clean, need clean quarters, need pure air to breathe. They are most likely to contract contagious diseases where the germs of disease are present. If you would not have your live stock exposed to the ravages of contagion, give them clean, healthy living quarters by using systematically and regularly a good, reliable disinfectant. The advertising in this paper of the Dr. Hess line of live stock preparations should have the close attention of all live stock owners. And among these preparations, none is more deserving a place about the stable than Dr. Hess dip and disinfectant. Dr. Hess dip and disinfectant is, first of all, a dip. It has a large use for the eradication of scab in sheep and sheep ticks. Also, hogs can be dipped or, what is perfectly to their liking, permitted to wallow in water to which Dr. Hess dip and disinfectant has been added. This is an excellent way to clean the skin and to rid them of lice—also for the treatment of skin diseases by keeping the skin in a condition to heal. A second and very important use of this preparation is as a disinfectant. It is necessary to destroy disease germs, keep down bad odors, etc. For such purposes there is nothing better on the market than Dr. Hess dip and disinfectant. It should be used freely about pens, stables, chicken houses, wherever there is a damp, foul-smelling place that affords a breeding place for germs of disease. It can be used to just as good advantage about the house as the stable, in sinks, drains, sewers, cesspools and the like. It will be found very valuable in the sick room, and in general to maintain healthful, sanitary conditions.—Adv.

Ready For Business.

WHEN you visit Adolph Nuttleman, West Salem, Wis., you will generally find him with a nice lot of Chester White pigs, and while many of the "boys" are complaining about the success they have had this spring, Mr. Nuttleman has nothing to say, for his pigs are up to standard. He had a few early litters and they are ready for shipment at this time; so if you want the pick of his bunch you must get busy at once. Mr. Nuttleman does not hold public sales, neither does he show at the fairs, so he has no reason to reserve the tops, consequently it is a case of the "first come first served" with him. This breeder is a good caretaker, and you will be pleased with the pig or pigs that you order from him. You need not be afraid to buy by mail from this breeder. Better order now, and don't forget to mention this paper.—Adv.

Sell Bull to Manitowoc Farm.

THE Pabst Stock Farm has just sold to the Manitowoc County Asylum Farms their young bull, Pabst Virginia Pontiac, born November 21, 1916, by King Pontiac, champion herd sire. The representatives of the asylum farms were on the lookout for individuality and have found just what they wanted when they visited the Pabst farm. Breeders are laying more and more stress on yearly records and the fact that there were 37 roomy box stalls, practically filled with cows under test, appealed strongly to the buyers. Pabst Virginia Pontiac's dam, Virginia Johanna, with a record of over 27 pounds of butter and 542 pounds of milk and a semi-official record at two and one-half years of 653 pounds of butter and 15,657 pounds of milk. This cow is by Johanna Rue Sarcastic Lad.—Adv.

Jerseys.

IF YOU want a few Jerseys, cows or heifers, E. E. Wyatt, Tomah, Wis., can supply your wants. He has a good working herd and you will be pleased with the Jerseys that he has for sale. He also has some young bulls coming on that are well bred and good individuals. Write him and please mention The Wisconsin Farmer.—Adv.

Bulls From A. R. O. Dams.

THE Silver Spring Farm Co., Eau Claire, Wis., have for sale a number of bull calves. They are out of their A. R. O. cows, for which this good herd is noted, and are out of an Ormsby Mercedes bull that heads the herd. Get the price on these young bulls. You can't afford to overlook this chance.—Adv.

THE Irreversible worm steering gear made by the E. H. Sprague Manufacturing Company, Department 15, Omaha, Neb., makes a wonderful difference in the ease and safety with which your Ford car may be handled. It absorbs the shock and strain that otherwise is taken up by the driver's arms. The front wheels are held firmly so that ruts and bumps cannot throw them aside, thereby giving absolute control from the steering wheel and minimizing danger of accident. This steering gear is inexpensive, easily attached, and is backed by the company's guarantee. Write the company for full particulars. See page 2.—Adv.

THE MARKETS.

Union Stock Yards, Chicago, May 5.—Continued liquidation of light cattle this week because of high feed cost and the belated rise of grass has carried values to irregular 15@40c lower levels on the bulk than a week ago, but there is no congestion in distributive channels and the vicissitude the trade has encountered has been due wholly to liquidation. This has put the visible supply in strong hands, weak holdings having been practically all dislodged. The market has possessed underying strength at all times. It merely needs relief from supply pressure to make a demonstration to that effect. The past six weeks have witnessed the slaughter of thousands of steers, especially yearlings, that would not have gone to the shambles under normal conditions until the July to September period. Many of them were laid in last fall for summer grazing purposes, but have been cut loose owing to the cost of corn and distrust of the future. The summer cattle market prospect warrants bullish sentiment. Visible supply from every possibe source is deficient.

Hog values are again crawling up. Whenever eastern demand revives, prices make a display of strength. In the language of a trader, "Hogs are not dear at $16.00. Product at that price costs us about 20c hung up. Figure what it is worth in Europe." Shipping demand is coming back. The recent break was due wholly to temporary laxity of orders from that quarter. If hogs were not worth the money, trash and quality would not be selling close together. Sixteen dollars for No. 1 hogs is warranted by supply and demand conditions.

The live mutton trade has continued last week's display of pyrotechnics. Supply around the market circle has hardly been within 50 per cent of normal even for this "between hay and grass" season when short runs are the rule and in the scramble for supplies sensational price jumps have been recorded which put last week's new records in the shade and which have more than verified the most bullish prediction. Sales of wooled lambs have been recorded up to $17.65, shorn to $14.65, while shorn yearling and two-year-old wethers mixed touched $13.25 and shorn matured ewes $12.50. Packers are fighting further upturns at this week-end, but the shortage in the available supply is acute and few care to venture an opinion as to what may happen in the way of establishing new high price levels in the immediate and near future.

Premature marketing has swelled cattle receipts at all markets for three months past and those who unloaded did not reinstate in a majority of cases. Already a load of long-fed steers weighing 1,400 pounds or more is a novelty and as the season works along this will be accentuated. Shortage of heavy cattle means tonnage deficiency. Two average yearlings are required to hang as much beef in the cooler as one big steer, consequently, supply statistics are deceptive. Numerically speaking, receipts of cattle this week have been liberal, seven western markets having had about 150,000 the first five days of the week, a gain of about 22,000 over the week previous and 33,000 more than the corresponding week last year, but average weights have been the lightest on record. A $13.40 top has been made on the best heavy steers and that kind is as high as a week ago, but the rank and file of the yearlings and fair to right good more matured steers of light and medium to strong weight have declined unevenly 15@40c. A fair class of dressed beef steers, not fat, but in decent condition, is selling at $11@11.50. If the crop could be limited to these and better cattle, the market would be in better shape. A grade of light killing cattle at $10.75@10.85 looks about 35c lower than a week ago. Good yearlings at $11@11.35 show less loss than the raft of $10@10.50 stuff. Whenever it is possible to hold these little cattle back it will be good policy. Considerable liquidation has been going on and some of these fine days what has happened recently in the lamb market will be repeated on yearling cattle. The feed bill is dislodging the June to August supply of little cattle long in advance of the usual time and it is probable that this stuff will keep coming.

The butcher she stock trade has been adversely affected by the declines in steers which the former must compete with for killers' favor. Good cows and heifers have been hardest hit, most of the cows now selling from $8.60@10, a right good to choice fat kind and heifers of good class going upwards from $9 showing 25@40c declines from a week ago, but common to fair butcher cows selling between $7.75 and $8.25 are not more than 25c down and canner cows are within 15c of a week ago, good cutters 25c down. Most of the canners are now selling at $6.75@7.00, cutters largely at $7.15@7.60. A spread from $8.25@9.75 is taking plain light to very good butcher heifers, only prime heavy and top-notch heifer yearlings being quotable to $11 and only cannery light heifers from $7.50 down. Bulls are a point lower than a week ago, but stags with a week ago while bolognas selling largely at $8.35@9.15, good to prime beef bulls at $9.40@10.25 and light canner bulls at $7@7.75. The veal calf market closes the week large-

The Wisconsin Farmer Sold His Live Stock.

THE WISCONSIN FARMER is certainly a good paper to advertise in, as I have found by experience. I sold a great many bulls, heifers and cows at satisfactory prices. —A. M. Anderson, Whitewater, Wis., breeder of Holstein-Friesian cattle.

Foster Smith, Mgr., Plymouth, Wis.

Auctioneers—Mack & Laux. F. H. Everson in the box.

Truttschel Bros.
Sheboygan Falls

Are consigning a 29-lb. bull sired by their splendidly-built 34-lb. herd sire. The dam of this calf is a large handsome cow, the kind from which herd sires should be selected. This 29-lb. calf is a well-marked show type individual and comes from a herd where all the A. R. O. cows, including two year olds, average nearly 27 lbs. Nine cows were tested last winter, including two two year olds, that averaged 29 lbs.

R. C. Stolper
Random Lake

Is consigning a large number of mature cows and choice heifers, bred to his 27-lb. bull, Johanna Segis Pontiac Polkadot, a son of King Segis Pontiac Polkadot, a full brother in breeding to the $50,000 bull, King Segis Pontiac Alcartra.

John Melius, Adell

Is consigning four cows, a two-year-old bull sired by his 34-lb. herd sire, King of Scott Valley, two bull calves, one yearling heifer and three heifer calves. Three of the consignment are sired by the 34-lb. bull and three of the females will be bred to him. The two-year-old bull and one of the bull calves are from the two best cows in the herd.

Struve Bros., Plymouth

Are consigning four choice heifers, three of which are bred to their 28-lb. bull whose cut is shown in this advertisement.

A beautiful yearling heifer consigned by R. C. Stolper, that is representative of the young stock he is consigning.

Struve Bros.' 28.71-lb. herd sire. They are consigning three good bred heifers to this sale that are worth looking up.

Good individual in her prime, bred to the 27-lb. bull, Johanna Segis Pontiac Polkadot, and consigned by R. C. Stolper.

Another splendid cow bred to Johanna Segis Pontiac Polkadot, a 27-lb. bull, and consigned by R. C. Stolper.

Truttschel Bros.' 34-lb. herd bull, the sire of the 29-lb. bull calf they are consigning. The dam of this calf is a large, superb individual.

CHESTER WHITE SWINE.

CHESTER WHITE

FALL BOARS of different ages, from September to November farrow, sired by Ignatz, the junior champion of Minnesota, 1915, and Calloway's Kind, first at Minnesota in the senior yearling class and grand champion at La Crosse, Wis., for sale. BOARS and gilts of August farrow, well grown, good type, sired by KING and BLACK EXPANSION. Prices right. Address
Jas. Derivan Fox Lake, Wisconsin

ly $1 higher than a week ago with the bulk of good to choice at $12.50@13.

Weather conditions have been more favorable for the stock and feeding cattle trade this week, but the steadily advancing corn market has been a bearish factor and bulk of the trading has been for a class of light fleshed cattle to put on grass. Prices have been well sustained. The bulk of sales has been at a range of from $8.75@9.75, a few choice fleshy feeders going at $10 and above. Most of the well-bred 700 to 975-lb. feeders are selling at $9.35@9.6 and fair to good kinds at $8.60@9.25. Ohio and Pennsylvania have been relatively good buyers. Traders are confident that a little warm weather and a let-up in heavy farm work will send a liberal number of buyers to market, as the shortage of cattle on feed for fall marketing is becoming more apparent each day.

Hog supply has been well maintained this week, the run around the western market circuit having shown a moderate increase over the week previous, but demand has been healthy and at the close yesterday prices stood within 5 to 10c of a week ago with a $15.95 top on choice heavy butchers and selected "singers" for the Canadian outlet and the bulk cashing at $15.60@15.90, the general average at $15.74 comparing with $15.78 a week ago. The present hog market has a legitimate appearance. Stocks are light and are being constantly depleted. Both beef and mutton are scarce and pork consumption will be enormouh right along. If the war continues enormous armies must be fed, while peace means universal demand for meats of all kinds. Skepticism as to legitimacy of present values under these conditions is unwararnted. Hogs have undoubtedly been closely marketed. There has been every possible incentive for gathering, prices being high and the feed bill likewise. The next considerable suppy, so far as tonnage is concerned, will be the summer crop of grass sows. There will be some fall-farrowed pigs, but they will cut little figure as far as the stuff that goes into packers' cellars is concerned. Sows will undoubtedly go to the shambles early at deficient weight.

Live mutton trade at the close yesterday stood 75c@$1.15 higher on lambs, shorn stock gaining most, and from 50@75c higher on sheep and yearlings than a week ago. Everything on the list is commanding record and phenomenal prices, but both supply prospects and wool trade conditions are such as to warrant expectancy of a continued remarkably high market. The top on wooled lambs, a supply now virtually limited to the last shipments of Colorado fed stock, has reached $17.65, or $4.05 per cwt. higher than the highest sale ever recorded here prior to the current year, and $4.75 above the top Colorado-fed lambs last May when $12.90 was reached for the first time. The top on fed lambs in 1915 was $11.85 and none ever sold prior to that year above $10.60. Shorn lambs are selling at an unprecedented discount for this season of the year from woolskins, but the spread between the two classes will narrow as the weather warms up. Choice 75-lb. shorn fed western lambs reached $14.65 here yesterday and the bulk sold at $14.15@14.45, only half-fat or extremely weighty kinds at $13.75 down. Shearers paid up to $17.10 for some heavy fleeced, mostly Colorado-fed lambs to shear and finish for the market. The last new crop western lambs to reach Chicago this season, good weight but rather dried-out Arizonas, averaged 67 lbs. and sold at $16.85. A few prime heavy native ewes in these reached $14.25, best shorn ewes and a good class of shorn wethers selling at $12.50 nad well conditioned 97-lb. shorn yearling and two-year-old wethers mixed up to $13.25.

1-2 TON I. C. S. AND CHESTER WHITES

WE are sold out at present but we are booking orders for spring pigs. These will be sired by Schoolmaster, the greatest boar of the breed, undefeated grand champion for 1916; Crandell-wonder, grand champion Ohio State Fair; Callaway Edd, grand champion Mo. WAIT Don't pay double prices for Your Separator!

Learn how Galloway has protected you with Patriotic Prices. Act Quick!

High prices are hitting farmers hard. And they are going to hit you harder. Farmers are compelled to pay more and more for implements, than ever before. But I am ready to give you the biggest separator savings of the times. I am going to save you separator dollars and prove you don't have to pay double prices. This **special-to-you-saving offer** is on my new sanitary—the Separator that holds the closest skimming and long life records. My big free book gives all the facts of my great offer. Send for it tonight sure.

Compare this New Galloway Separator

Compare! It beats the best in every test. That's the real proof of my separator quality. The highest priced separator you know doesn't run any easier, skim any closer or last any longer. Test after test by thousands of farmers have proved it. A high price doesn't mean the best separator. Do you wonder where that extra money goes?—the difference in cost between my low price and the price you pay for other high grade machines. I'll tell you in my book. I'll tell you where every dollar goes. My big book contains separator secrets that you ought to know. **Send for the Book today.** Learn all about separators.

When you buy the Galloway, you save one half because you deal direct with me, the manufacturer. I make this new Galloway Sanitary Separator complete right here in my immense factories at Waterloo. You buy it straight from the maker. The half saved stays in **your pockets** and you get the **best separator** made besides.

I want you to read the big Galloway Money-Saving Book and learn how I "divide the melon" with my farmer friends.

Get My FREE Book

These Are My Patriotic Prices!

Right now—when the country is calling for greater farm products! Right now—when you need a separator most, I am stampeding them all with my greater-than-ever separator offer! This special-to-you price proposition is my way of helping you to help the Nation. This year, of all years, much depends upon you men and women on the farm. These **save-you-half prices** show you how I am doing my bit so you can do yours. Every labor-saving implement you get now means that much more for you and the country.

Act Now—My Save-you-half Offer for 60 Days Only!

It's your last chance to save big money on a separator. Prices are soaring up and up. So don't hesitate—but act! Act! I set a 60 day limit for my special-to-you low-price proposition. How long my supply of these new Galloway Sanitary models at these half-to-you prices will last, while the rush is on, I cannot say. But I promise you this! If you let me hear from you now—**at once**—I'll see that you get prompt service and immediate delivery.

Sold to You on Trial! Test it for 180 Milkings!

Yes Sir! Test it for every separator point. Test it alongside the highest priced separator you know. That's what thousands of my separator customers do, and they come right back and say my new sanitary beats them all. But take nobody's word. Try it for 90 days yourself. Then if it isn't just what I claim—ship it right back. I'll pay the freight both ways. Its clean, perfect skimming will astonish you. You will marvel at the ease with which you can operate and clean it. Every part is rounded—no sharp corners for dirt to gather. It runs true in perfect alignment—always—because one casting—the gear case—supports all the gear shaft and both bowl-spindle bearings.

The entire gearing has but two high-carbon steel shafts—equipped with long perfect fitted bearings. All working parts run in constant oil spray. No sharp edges or corners in bowl to brake up butter fat globules. Separating discs separate entirely from each other for washing. Every drop of milk gets full skimming force of the bowl. Milk is so distributed that each disc gets its full share to skim.

There is no flooding the top of the bowl and no cross currents at the bottom. And the capacity is just what I say it is. You get the **exact capacity** you want and pay for. I know separators from the ground up. I stand back of this new sanitary model with a guarantee of ten years perfect service. I protect you absolutely. You cannot lose.

Send the Coupon—Get My FREE Book—See how I am Busting Prices!

Stop where you are if you are just about to invest in a separator. Don't decide on any separator until you get the facts on my new direct-to-you offer. Send me this coupon now—this minute. Get my book and learn these separator price secrets. This coupon leads you to the bargain of all separator bargains. It will put you in right, once and for all in this question of separators It explains why dealing direct with the maker saves you big separator money.

This book will open your eyes to separator values and means money in your pocket. Remember the risk is all mine. You can try my separator 90 days. Ship it back if it don't suit. Send me that coupon—now before you lay aside this paper.

Wm. Galloway, President, Wm. Galloway Company, 33 Galloway Station, Waterloo, Iowa.

Any Capacity You Need

375 lbs. 500 lbs. 750 lbs. 900 lbs. per hour.

What Users Say:

Two Years Old. Runs Smooth as Ever.

Gentlemen: I am very highly pleased with my Galloway Sanitary Separator. It looks well and runs as smooth and easily as the day I uncrated it two years ago. I believe that in ten years from now it will be in good condition. I have six cows in my dairy herd now and expect to increase it to ten next year. The work is so much easier with a Galloway Separator that we can handle ten cows as easily as we could three with the old gravity system. Geo. E. Carpenter. Dafoe, Mich.

Easy to Run and Clean

Gentlemen: I have used the —— (names high priced machine) separator, but find the Galloway better in every respect, both in skimming and turning. Also the Galloway is easier to clean than others, and I am perfectly satisfied with my machine. A. J. Simmons, De Kalb, Ill.

Wins the Contest

Dear Sir: We have a contesting association here and we had our separator tested. It tested the best of any separator around here. F. Moore, R. 1, Viking, Minn.

Kept Skim Milk 3 Days But Found no Cream

Gentlemen: We find your No. 9 New Sanitary Cream Separator to be a first class machine in every respect, easily operated, easily cleaned, perfectly sanitary and a close skimmer. Have kept the skim milk for three days without one particle of cream appearing. Mrs. H. S. Campbell, Cynthiana, Ky.

THE WISCONSIN FARMER

VOL. XLVI. NO. 20. THURSDAY, MAY 17, 1917. WHOLE NO. 1842

Making Agriculture Interesting.

Miss Maude Mitchell, of Sussex School, Waukesha County, Wisconsin, Has Worked Out Quite Satisfactorily the Handling of Agriculture in Rural Schools.

THE Sussex school, Waukesha county, has in many ways achieved a little bit more than the ordinary. It has demonstrated that the teaching of agriculture can be made of enough interest so that the parents encourage the effort of the child in pursuing this subject. It has also demonstrated that a woman can teach agriculture so that the children will actually learn something. There is no better evidence of the satisfactory results attained than the prizes awarded in competition with state and county bodies at the respective fairs. And the Sussex school has had a number of prizes awarded it within the last year. At the Wisconsin State Fair last year their complete exhibit won first prize in the educational exhibit for industrial work in all grades against all other counties in the state. The prize went to the Sussex school representing Waukesha county. Pupils from the Sussex school have won firsts in the county and state canning contests in county educational exhibits and in industrial work in these exhibits.

"I like to do a little more than is outlined in the book when it comes to teaching agriculture in a school," said Miss Maude Mitchell, in speaking of her work as principal of the Sussex school, District No. 10, Lisbon, Waukesha county. The added touches requiring much work and planning outside of school hours are the important factors that go to make up a successful course of study. Since its introduction into the rural schools, agriculture has come in for much criticism warranted to a large extent by the ignorance and attitude of the grade school teachers who taught the work. Miss Mitchell does not come under this classification and her pupils, instead of regarding the agricultural courses as tedious and useless, try their level best to do the work assigned to them a little better than the other boy or girl. This spirit has made the prizes possible which Sussex school has to her credit in county and state contests.

There are about 100 pupils in the school. Industrial work is taught in all grades. The mere requirement of teaching children the industrial work does not bring results. The teacher must be able and willing to do more than the prescribed bit. Children have active minds and their interest is only a passing one on most subjects. Making the course of study attractive enough to hold their attention is the acid test of ability. Results follow as a matter of course where this is the case. There are various methods of holding a child's attention. Miss Mitchell does it by tying up the work with the common farm practices. Thus during the course of study the pupils learn the proper method of testing corn, and after they have made a test of their own corn from the farm and have really grasped the essentials of a strong and a weak kernel, they are permitted to assist in the testing of corn brought to the school by farmers of the neighborhood. This corn is tested free of charge to anyone in amounts sufficient to plant ten acres. Thus many of the farmers, though they have already run a test of their corn, can get a check on their work by bringing samples to the school. The result is interesting to pupil and farmer alike. The one wants to show his ability and the other anxious to have his test verified.

In like manner the work in the dairy course is handled. Representative samples of the herd and of individual cows are taken and tested for fat content with the Babcock tester. Each pupil is taught the importance of accuracy in testing and the difference of reading the test correctly and incorrectly. They know as well as their parents that proper temperatures play an important part in the correctness of the test. They also have a very definite idea that some of the cows that are being milked at home must not be as profitable as supposed by the family. Feeding principles and the worth of the different feeds are taught with a home problem as basis for the study. That is something real to tie to and that makes learning worth while. At the close of the course the farm of some large and successful dairy farmer is visited and the owner readily consents to take the leadership for the day. Type and conformation of dairy cows are studied and the young boy or girl finds nothing tiresome about seeing a record animal and having the outstanding features pointed out. With the records of the cows to prove the points that go to make for large production, it gives the young mind a mental picture that will not so soon be lost.

SUSSEX GRADED SCHOOL, WAUKESHA COUNTY, WISCONSIN.

Noxious weeds are handled in the same manner the other subjects are treated. Each child is asked to make a selection of the weeds found on the home farm, and when these have all been neatly pressed and mounted on charts and identified, other weeds are gathered. Of each weed the life history and method of eradication is studied. The collections of the children are all uniformly neat and complete. Some have larger collections than others, but none are allowed to have below a set minimum number.

In the same way the other products of Wisconsin are taken up and studied, not from the standpoint of making these young minds authorities on any one or all of these subjects, but simply to stir the curiosity of the pupils and teach them some of the little things that will lead to larger accomplishments in the future. And the method followed by Miss Mitchell is very promising.

A great help in making the young students appreciate neatness are the charts which each must prepare on the subject studied. Exhibits of different kinds are also prepared by individual students. For instance, the son of the local cheesemaker will make a chart showing the different processes that have to be completed before the finished product reaches the market. These charts consist of samples of each step and are hung in the schoolroom. At the proper time the different steps are explained. With the chart goes a manuscript on the subject based on bulletins, textbooks and farm papers.

With each study taken up the implements necessary in planting cultivating and harvesting the crop are studied. Each child must know the name of the implements and by an arrangement with the town implement man these are explained in detail to the class.

Manual training has been carried on with some difficulties, due to lack of equipment, but the work is progressing well now.

In the domestic science courses the girls under the leadership of Miss Pearl Boots are also showing splendid results. Alternating each Friday afternoon the girls of the sixth, seventh and eighth grades take up cooking and sewing. As the time allowed by the schedule is too short to give the course the completeness which marks everything in the Sussex school, they are allowed to do considerable work in both branches at home for credits in the course. As a final and fitting conclusion to the course, the graduating members of the sewing class must make their own dresses to be worn at the graduation. These dresses are all alike in design

Questions and Answers.

Only Eight Miles to the Gallon.

I have a Model 83B Overland car which will not run over eight miles to the gallon of gasoline. The car runs well, and no gasoline leaks can be found. Your advice will be appreciated.

Answer.—The most common causes of excessive use of fuel are leaks in the gasoline tank or gasoline line, running with the spark too far retarded, faulty carburetor adjustment and incorrect timing. Gasoline evaporates so quickly that a small leak may not be noticed. A leak may be detected by noting whether the gasoline level in the tank lowers overnight.

A Three-Horse Evener.

I enclose a sketch of a three-horse evener. My horses weigh 1,660, 1,425 and 1,160 pounds respectively. All are in the best of condition for farm work. How much advantage should the 1,160-pound horse have on the evener so that the draft will be divided among the horses according to their weights?

Answer.—Figure 1 shows the general arrangement of the evener and the location of the horses. Figure 2

FIG. 1.

shows the pull at each end of the doubletrees and where the center holes should be located so that each horse will pull according to his weight. We will first consider doubletree B. The 1,425-pound horse is pulling on one end of this doubletree, and half of the pull of the 1,660-pound horse is exerted on the other. One-half of 1,660 is 830. The problem then becomes to locate the center hole so that the distance from the hole in the middle to the hole on one end multiplied by the pull on that end, is equal to the product of the other distance by the other pull. Referring to B, figure 2, it will be seen that

$$19 \times 830 = 11 \times 1{,}425, \text{ nearly.}$$

The distances 19 and 11 are found as follows:

$1{,}425 + 830 = 2{,}255$, the total pull.
$30 \times 830 \div 2{,}255 = 19$, the distance from the end hole to the center hole, 30 inches being the total center distance.
$30 - 19 = 11$, the other distance.

By a similar process it is determined that the distances for double-

FIG. 2.

trees A are 12½ inches and 17½ inches. The total loads on each end of the tree C are then found to be 2,255 pounds and 1,990 pounds. The distances between holes are then found as above. These rules apply to the dividing of loads on all eveners where the pull is in a straight line.

Manganese Dioxide.

What is manganese dioxide made of, and how should it be mixed for dry cell use?

Answer.—Manganese dioxide is an ore, somewhat like iron ore. It is bla k and is composed of manganese and oxygen. When used in dry cells it is made into a paste by mixing it with water in which a small amount of sal ammoniac has been dissolved.

Lighting With Dry Cells.

I intend to install electric dash and tail lights on my Ford car. I have two-candle-power, three-volt bulbs in all the lights. I intend to use one switch. Please tell me how to wire the outfit. How many dry cells will be required?

Answer.—You will require twelve dry cells. While they are fresh, connect them in series-multiple, two in a series; that is, connect the cells in pairs, connecting the carbon of one cell of each pair to the zinc of the other cell, and then connecting all the remaining zinc terminals to one lead wire and all the remaining carbon terminals to the other lead wire. Run one of the lead wires to the frame of the car and ground it. Run the other lead wire to the switch. Wire from the switch to the tail light, and from the tail light to the frame of the car, grounding the wire. Run other wires from the switch to the two dash lights, and run a ground wire from each of the dash lights to the frame. After the cells are so old that the lights do not burn brightly, connect the cells in series-multiple, three in a series.

Car Runs Unsteady.

Can you tell me what is wrong with my Ford car? It pulls well on high up to about fifteen miles per hour, and then starts to jerk as though one cylinder is missing. By blowing the exhaust horn, it sounds as though one was missing. Above twenty-three miles per hour it runs fine. Have just removed the carbon from the cylinders and ground the valves.

Answer.—Your trouble may be due to worn or poorly adjusted vibrator points. First, determine which cylinder is missing. To do this, speed the engine up until the one cylinder begins to miss. Take the cover off the coil box and hold down the two outside vibrators with the fingers. This cuts out cylinders one and four. If cylinders two and three then run unevenly the trouble is in two or three; otherwise in one and four. If the trouble seems to be in two or three, hold down the vibrator of first one and then the other. You can then determine by the sound of the exhaust which is missing. When you are facing the coil box, the coil at the right hand end of the box controls cylinder No. 1; the coil next to it is No. 2; the next No. 3, and the left-hand coil No. 4.

Having determined which cylinder is missing examine the contact points of the coil for that cylinder. See that the points are flat and smooth; then adjust them so that when the vibrator spring is held down the gap between the points is slightly less than one-thirty-second of an inch. A further slight adjustment may be necessary to obtain the best working position.

Electric Light for Your Home

The Uni-Lectric is a complete electric service station in home size. Generates standard 110-volt direct current. Big capacity—operates one to 60 lights, electric motors up to 1 h. p., electric irons, electric heaters, vacuum cleaners, force pumps, churns, separators, washing machines, etc.—24 hours a day, every day in the year if you wish. Uses standard lamps and fixtures.

No Belts—No Batteries

Our patented, high-speed, rotary sleeve valve engine operates the modern, high-speed generator with such smoothness that *all necessity* for storage batteries is eliminated. Thus the renewal of batteries and battery up-keep cost is entirely done away with. Outfit comes in one small compact unit, ready for quick installation. Simple, dependable and economical. The *entire* outfit is fully guaranteed. Write today for free copy of our new catalog on farm lighting plants.

Waterman Motor Company
106 Mt. Elliott Ave. Detroit, Mich.

The only home size light plant that operates without storage batteries.

Uni-Lectric GASOLINE-ELECTRIC UNITS LIGHTING SYSTEM

E-B (Newton) Wagon

Backed with 65 years of experience. An excellent example of E-B quality. Light running; drop hounds; seamless skeins; angle steel grain cleat; special reinforced box bottoms. One of the many articles in the E-B line. Look for E-B trade mark. It is our pledge and your guide to quality.

Emerson-Brantingham Implement Co. (Inc.), Dept 37 Rockford, Ill.

GET MY PRICES

BEFORE YOU BUY BE sure and get my prices! Before buying a gasoline engine (manure spreader, cream separator or tractor) of any make, or kind, or price, please ask for and read Galloway's 1917 catalog—the biggest, most important book and greatest money-saver for my customers I ever put out! Get my proposition to you and compare it with all others; then be your own judge! We are actual manufacturers and sell direct to you from our factory. We specialize on the lines we offer. We were first to offer engines, separators, spreaders direct from the factory at one small profit. We have made the manufacturing and selling of these lines a life business. You can't afford to buy a gasoline engine or any of the other Galloway lines until you first get our prices and our proposition. Get my price before you buy! Cash or time.

HERE'S THE REAL PROOF!

I can't give it praise enough. I had a 6 h. p. Galloway engine belted to my 16 in. corn mill and it does the work, where an 8 h. p. of another make did not. M. P. SHOEMAKER, DEFIANCE, TENN.

It has not cost me one cent for repairs. Am now buying a 2-1/4 h. p. engine and washing machine for the home. Consider the Galloway simplest engine made. ADOLPH DRINOVSKY, TRAER, IA.

I found the 16 h. p. Galloway simplest, most powerful, best governed engine I ever saw and $[illegible] cheaper. HENRY WEBBER, MILTON, WIS.

My 8 h. p. Galloway was 5 yrs. old this fall. Works perfectly—good for 15 yrs. yet. HAROLD W. BARNES, DELPHI, IND.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

STORIES OF FARM SUCCESS.

A FEW weeks ago I printed the letter of Mr. Ernest Schaal, of Oconto county, Wisconsin, a subscriber to The Wisconsin Farmer, who came to the grain belt in 1849, the youngest of eleven children of German parentage, and who, by determined effort, good farming and a high faith in God, here in the Badger state, has made good, so that today he has a good farm, a fine wife and eight fine children and is a pillar in his community. You may recall that Mr. Schaal made this statement:

We set up our family altar the first morning (after marriage) and never let anything sidetrack us from our religious duties. I never considered myself very smart, but was just foolish enough to have great faith in God and His word and believed that in the keeping of His commandments there was a great reward.

I expected many letters to come to me as a result of the publication of this one, but I was not prepared for the avalanche. They have come from every part of the country, from all sorts and conditions of people, from young and old. Mr. Schaal's testimony to the family altar seems to have stirred my readers more than anything I have printed in a long time. It has carried many a pioneer back to the early days and made the tears come to the eyes of many a man and woman of the farm who remember their own days of adversity when about all they, too, had was an unconquerable faith. Here, for instance, is a portion of the letter of Mr. John Thompson, a valued subscriber, who believes that Mr. Schaal may rightly attribute his success to his serene and constant faith in the Giver of all good things. Mr. Thompson writes, in part:

Dear Mr. Pierce:—I have just read the letter of Mr. Schaal. I note the surroundings (a log distillery, where he learned the multiplication table on the rectifying tube) of his early life and also the pivotal point, when his ambitions and decisions started for a certain goal. Now after the lapse of years, with the achievement and success that have come to him and the sunset of life coming on, I wonder if Mr. Schaal realizes what it was that led his ambitions in that way. I can see how he would keep on the way he did by the manner in which he and his Christian wife started up their home, namely the erection of the family altar, the best asset he could have chosen to brighten life's sunset. Going to church with our team was also the custom in my day, and my wife and I have seen from the lumber wagon, spring wagon, top buggy, surrey and rubber-tired buggy up to the top-notch auto to go to church in, all in one lifetime. Yet God's goodness and love have not changed. That simple faith and trust in Him still bring their reward and they are eternal. And now in the evening of life, is there any comfort and satisfaction to repay for the many trips to church and, of course, the means or money that he has given? Or would he be willing to go back to that turning point in life and make some other choice with some other goal in view? I am a man only six years younger than Mr. Schaal, and my life and aim have been to hold up the family altar and cultivate that simple faith in God, and I find there is joy and comfort as the sunset of life draws on.

You may recall that I asked others of my readers to tell the story of how they grubbed success from the grain-belt soil, now that the sunset of life is reddening the horizon of their careers. Many have complied with my request and their letters are extremely interesting. I shall print several of them, from week to week, for I believe there is great inspiration for all of us in the true stories of men and women in Wisconsin who have overcome obstacles and temptations and have come to be the leading, reliable men and women of our communities. As the second installment of these life stories of Wisconsin farmers let me print the letter of Mr. W. A. Lawrenson, as follows:

Dear Mr. Pierce:—I am just a new subscriber to your valuable paper, but reading the experiences of people in regard to how they started life and how they have prospered reminds me of a Methodist testimonial meeting, which I always enjoyed, though I am not a Methodist, only in that respect. I thought I had as hard a row to hoe in my early life as anyone. But I will take my hat off to Mr. Schaal, whose letter I so much enjoyed.

However, I was born in Liverpool, England, on May 18, 1864, came to the United States in May, 1873, with my parents. In the next year my father got killed, leaving my mother in destitute circumstances, with seven children, the oldest boy thirteen years old. I was eleven, one sister sixteen and two boys and two girls younger than myself. Mother washed and cleaned house, my brother and I would saw wood till after dark when we had been in school all day and all day Saturdays. When we could not get a job for our board in the winter my oldest brother and myself would go to school, sometimes three months in a year, and sometimes we did not go at all. When we got a dollar we gave it to mother and by so doing we kept the younger children in school until three of them taught school. Then we all put our earnings in the same pile, mother being the cashier, until I was twenty-nine years old and my oldest brother thirty-one. At this time we were farming on 320 acres of land of our own. I thought I ought to start a home for myself, so mother paid $825 on eighty acres of land, gave me three good horses, but a poor harness, eleven sows and one cow. So to make things complete I got married. My wife had taught twenty-four terms of school and had saved $400, so you see she was no spring chicken, being twenty-five past and I twenty-nine past, but we went to work and paid off a $600 mortgage. I lived there six years, when I traded in on 220 acres of better land and went $4,000 in debt. I have paid out, built a barn and then a house. We have four boys and one girl. Our oldest boy is twenty-one, the second boy past nineteen. They have both taken a business course. I don't want a child of mine to go through the world like I have. I have always tried to keep them in school. Last year I hired an old man to feed the pigs, gave him $25 per month and the eggs from 300 hens and the milk from six cows for two months. I rented forty acres of oat land that I had sowed with clover to a neighbor and had the same neighbor put up my alfalfa. We finished plowing corn on the first day of July and on the third I took my family, seven in all, the northern route to the Pacific coast at Newport, Oregon. We were there two weeks and then went to Eugene, Oregon. We got as far south as Los Angeles, Cal., and came back by the Salt Lake route. We went over 6,000 miles and saw nothing as good as the good old grain belt here for farming. When one gets a little dissatisfied there is nothing that will do them as much good as a trip.

This is exactly the sort of a letter I like to receive, a plain, unadorned tale of how a man made good on a Wisconsin farm. Think what an inspiration such a letter is to our boys and girls. I could hardly do better than to devote this entire page of mine to just such "human documents" for several weeks to come. Will those who are interested continue to write me in this strain, so that I can select the best and pass them on for the inspiration and guidance of all my readers, young and old?

There is many a heart-interest story concealed in the life of the farmer who grubbed his way to success, and this story is almost certain to inspire some other man to overcome obstacles and make good likewise. I have always found biography the most interesting reading in the world. Let us have some good life stories which will reveal the grain belt in the making and be an inspiration to all. Write me at length. I will not print your name unless you permit me to do so.

THE FARMER'S DUTY.

IT BECOMES more and more apparent to me every day that the great war, not only so far as Europe is concerned, but the United States as well, will be won by the farmer fully as much as by the soldier. Perhaps it is wrong to draw the contrast between the two men in this manner, for, after all, the farmer is a soldier, under orders to make his acres and his fields produce to the utmost, fighting battles every day, with the rain and the sun as his shrapnel and shot, battles which will determine the outcome of the war fully as much as those fought with powder and long-range guns in northern France and wherever the trenches extend.

France's greatest statesman of today, Vice Premier Viviani, is in the United States and, in company with General Joffre, the hero of the battle of the Marne, he toured the grain belt last week. He paid his tribute to the farmer and to the important part he plays in the present war when he said, in a speech at Decatur, Illinois:

Every bushel of wheat, every peck of potatoes counts as much as shells and bullets, and even more. In such a war as this, all must serve if it is to be brought to a quick and victorious conclusion. The farmer and his field fight the cannon foe as efficiently as the soldier in the trench.

That being the case, is it not the duty of every farmer, not only here in the grain belt but throughout the entire country, to redouble his efforts, to produce to the utmost, to fight the good fight in the furrow and feed lot, just as his brother soldier is fighting it in the trench and dugout? "Nail a flag to your plow and work for your country as you would fight for it," is the slogan of a southern editor, and it is a good one. We may not literally nail a fluttering flag to the plow which turns the moist earth these days, preparing the seed bed for the harvest's fruitage, but when we do our full duty on the farm we are carrying the flag on its way toward ultimate victory just as much as though we were firing a machine gun or twisting cold steel into the form of the enemy. One of the best-posted writers on agricultural and economic subjects in the country made this statement the past week:

If France, Italy and Great Britain are not fed, they will be defeated in ninety days, and we shall be defeated with them. We must send them the food they need, even if we have to go on short rations ourselves. No longer, if it ever was necessary, is this a matter of generosity or profit or policy; it is stark, bald necessity. Not to do it last year might have been good or bad policy or good or bad business; but not to do it this year, and next year, and the year after, and for ten years if necessary, will be perfidy. It will also be insanity and idiocy. We must feed our soldiers; and the men in the trenches, from the Swiss frontier to the North Sea, in the Trentino, at Saloniki, on the Suez front, in Mesopotamia, along that long, undulating, snaky line from Bessarabia to Riga, and the workers in fields and factories all over our side of the divided and battling world—all these are our soldiers just as much as if they wore our uniforms and fought under our flag. We must feed them as fully as we can. We must also feed ourselves.

It is not a time to stop and indulge in arguments over the necessity of the government's establishing a minimum price for farm products. That will come in due time. To refuse to put acres under cultivation now, when the season is on for such work, is the same as if a soldier bearing a musket were to throw down his arms at the order to "charge" and demand better pay for fighting to keep his country alive and civilization triumphant. My voice has always been raised against war, it always shall be so raised; but our country and our flag have need of every man today, and duty to country and flag rise above individual opinion and principle. Fight the good fight in the field and feed lot, as well as in the trench and dugout, and victory will be ours, a victory, which, I believe and pray, will mean an end to all wars for many, many years to come.

TAKING CARE OF THE CROPS.

I HAVE frequently expressed the opinion, on this page, that the marketing end of farming is as important as the producing, and that the successful farmer is one who studies market conditions and reports fully as much as weather conditions and reports. Therefore, I am in hearty accord with much that my correspondent, Mr. A. W. Cooper, says when he writes me as follows:

Dear Mr. Pierce:—Being a subscriber to your valuable farm paper I thought I would write you on a subject which I think should be studied. All the newspapers are advocating and advising us farmers to raise big crops, plow up all the waste ground, do all we can to raise food supplies. I have not seen one word as yet about taking care of the crops after they are raised. I have been farming and trucking for a good many years, and many times I have seen my garden truck go to waste or accepted prices that would not pay me 10 cents an hour for my labor, to say nothing of the seed and the land. I see there is talk of lots of appropriations to be used for agricultural purposes, and I am of the opinion that the most of them will be invested in red tape and commissions. I think it ought to be put into state-owned elevators, granaries, canning factories and cold storage plants, all owned by the state. I think the state should control prices and not let a lot of middlemen get rich plundering the people. The idea of buying potatoes at 80 or 90 cents a bushel and selling them for from $3 to $4 a bushel! I am for raising all I can, but I want a fair price for what I raise and I don't want the people to be held up. I know there is lots of waste land in this country where potatoes and other crops may be raised that would feed all the people in the country and leave some for shipping out of the country. I would advise all farmers and truckers to build big dry caves and store their potatoes and other root crops. I think there will be a big fruit crop (except peaches, they are nil) and fruit should be taken care of. I don't see any reason why we should be shipping foodstuff from other states when we have so much good land growing in weeds.

I think Mr. Cooper will find the solution to most of his problem lies in organization. The day is coming—and not so very far distant, either, in my opinion—when farmers will be organized all over the country, to such an extent that they will virtually determine the price which shall be paid for their product and their interests shall be considered paramount to all others. The farmer has suffered from lack of organization in the past. Relief is coming. The coöperative movement and the onward sweep of the farmers' clubs are opening the eyes of farmers all over the grain belt to the value and necessity of organization. There is no reason under the sun why the farmer, practically alone among men, should have no voice in saying what his labor shall be worth, what the fruitage of his summer's efforts shall bring when it is marketed. Because we have suffered this condition to exist for such a long time is no reason why we should permit it to continue much longer.

I have frequently printed stories showing how local organizations of farmers have succeeded in

(Concluded on page 5.)

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of 100 or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address

THE WISCONSIN FARMER, Madison, Wisconsin

No Cause For the Farmer to Worry.

In almost every county in the state patriotic meetings have been held, either under the direction of the County Council of Defense or at the instigation of citizens. The farmer occupies a most conspicuous place in all of these meetings and in the addresses and orations. It is realized by all that Wisconsin's biggest opportunity just now is to produce food for the nation. The writer was asked just a few days ago whether the state and agricultural authorities are overdoing it in their effort to induce the farmer to produce more. At first hand we would say "no." It is not possible to overemphasize the needs of the nation and world in the way of food at this time. When we realize that the United States this year will produce just about as much wheat as we ordinarily use ourselves we begin to wonder where the food for the balance of the world is coming from.

The farmer is just as patriotic as any man or class of men. He happens to be a little busier right at this time than a few other men. The season is late and the farmer may be pardoned if he takes out his patriotism in hard licks on the farm these days rather than in shouting at the patriotic meetings. He can do that later when the grain and garden are all in.

So for the present the farmer is talking less about war than any other class of our people. At the big spring live stock sales we have scarcely heard war mentioned.

There is nothing in the present situation to warrant any unrest on the part of the farmer. His chief duty is to "saw wood." His business will not be injured by the war. Occasionally we find a man who wonders whether the government will fix a maximum price on foodstuffs or a minimum price. So far as the farmer is concerned this subject is not worth worrying about. If the government does not fix a minimum price on grains or other farm products, the law of supply and demand will fix a price which will amply repay the farmer for his efforts. If the government in the interest of a low-priced food for the country, fixed a maximum price, that maximum is going to be sufficiently high that the farmer will make big profits on everything he raises. No one has suggested a lower maximum price on potatoes, for instance, than $1 a bushel. There has never been a year in the history of Wisconsin when farmers would not have gladly contracted in advance for all their potatoes at $1 a bushel. It has been suggested that $1.50 or $2 be made the maximum price for wheat. Such prices beat the 79-cent wheat we had not so very long ago. If the maximum for corn is fixed at 75 cents or $1 a bushel no hardship would be placed upon the corn raisers of the state. The government is not going to set the price of farm products down very low at this time, and, as we have said before, the matter is not worth worrying over. Furthermore, the government is likely to take a hand in other prices, if it undertakes to regulate farm products prices, and we may get some things cheaper than we are now getting them on the farm.

The cue for the farmer to take is to proceed along the even tenor of his way. Speed up wherever it is possible, and don't let any land or work be wasted. Buy as usual such things as are needed for the farm work and the health and comfort of the family. The farmer can come nearer affording luxuries the next few years than any other class of our people. Proceed with farm improvements as usual and as time and labor conditions will permit. Do not be scared at advances in prices of implements, building materials, fencing, paints, automobiles, oils, tires, etc. Most of these things will necessarily be higher in price. Compare the advance with the advance which you are receiving for corn, wheat, oats and live stock and you will see that you cannot expect the world to increase your pay and leave everything else at a standstill. Do not be afraid to buy good stock even at high prices. Of course, judgment should be used. But prices are advancing all along the line and it is simply a question of readjustment.

The farmer should not be afraid to borrow money in these times. It is probable that money will be plentiful throughout Wisconsin, and that interest rates will be reasonable. It pays to borrow money—as much as you can use to make more money on. The Wisconsin Farmer looks for continued high prices on farm products for at least three, probably five, years. It may be much longer. Our advice to young men is to get farm land. Get it as reasonable as you can, but get it. We mean this advice for the young man who knows how to run a farm and who is willing to work.

In general, our best word to the Badger farmer today is, "Don't hedge." Don't let the war scare you or cause you to haul in your sails. Let your sails out to a favoring wind. Go right ahead as usual, taking an optimistic view of the future, and making every lick count this summer.

Wisconsin Farm Help Situation.

Everyone seems to be interested in helping the farmer get help. As a matter of fact, the farmers of the state have made no general appeal for help. We do not mean by this that there is no demand for good experienced help, for there is, but one would imagine from the papers nowadays that the farmer had hoisted the white flag and issued a Macedonian call.

The farm help problem is slowly being systematized so that the farmers may soon actually get some help in getting labor. Just at this time there is a great mass of applicants for jobs on farms. No one with experience or farm knowledge has had an opportunity to cull out the good names from the list. The farmer is too busy to look up each man who is applying for help, and, in fact, rather than waste a day or two on such an errand he goes ahead in the fields whenever the weather will permit.

The best source of farm help available at this time in Wisconsin is the State Free Employment Bureau. This bureau has offices in Milwaukee, Superior, Oshkosh and La Crosse, and also a general office at the state house in Madison. The daily newspapers have been making a splendid effort to supply help, but these publications are unfortunately not in a position to do a great deal of good. They have no one to make a personal examination of those who want jobs, and in most cases have no one competent to judge the fitness of men for places on farms. Hence the farmer is taking a long chance in getting help through this source. It happens that there are still a few idlers in the cities who think they can get board and room and about $50 or $60 a month by going to work on a farm. The job appeals to them and they have visions of hiding away over behind the brow of some hill, far off from the farmhouse, and leaning on the hoe handle or even sleeping in the shade. They know that the meals will be good and regular and that sleeping is fine out in the country air. Such fellows are not worth much more than their salt on a farm. It takes a man to look after each man and the boss to look after both of them to keep things moving. The farmer is interested in getting good help, but he is afraid of getting stung and he has no room for the man who does not want to work early and late and at a salary somewhere near what he can earn. Of course, there are a large number of good, reliable young men and our farmers are glad to get hold of these, when the young men are industrious, willing to learn, and will attend to their business. There is so much work in the cities these days that the average man from Milwaukee or Chicago who is out of a job and wants to go on a farm is really not worth much as a laborer either in the city or the country. There are notable exceptions, of course.

The first big move in helping to solve the country help problem is to marshal all the resources in the country and the small towns. Don't let the boys go from the farms to war—at least not now—no matter if they are anxious to serve their country. With their knowledge of farming they can be of greater service at home. In many of the small towns there are young men and older ones who have had some farm experience, and who know what farm work means. Enlist them in the agricultural campaign. The Wisconsin Farmer believes it is best to rake and scrape our home state first for help before trying to bring in others from the outside.

Those who work on farms and give good service are going to be well paid, but don't think that the farmer is a millionaire. If farm labor goes too high it will discourage the farmer in his efforts to produce more. The farmer has to make a living and a profit on his work. He is paying more for labor now than ever before and is willing to pay well, but don't try to sting him.

Farmers' Club Problems.

Elsewhere in this issue appears a letter from the pen of Mrs. Mary Huntington Comings, of Eau Claire county, and interesting information relative to farmers' club work in that county. This letter raises a few interesting points which may well be discussed with profit by our readers. The Brunswick Neighborhood Club holds its meetings regularly on Sunday afternoons and this statement will arouse a discussion in many communities. The Sunday meeting time has been thoroughly threshed over in Eau Claire county. Mrs. Comings gives some reasons for the Sunday club meeting and in her letter to The Wisconsin Farmer adds these words:

> Last, but not least, we prefer our meeting on Sunday because we like a practical, everyday kind of religion, and we think we are doing a little to bring nearer His Kingdom on earth, when we coöperate to improve our farms, our schools and our homes.

Undoubtedly there will be those who will say that the Sabbath day should be reserved for church services only, but in the case of the Eau Claire county neighborhood it is shown that those who objected most strenuously to clubs on Sunday were those who paid very little, if any, attention to church. The facts are well recited in Mrs. Comings' letter and we would like to have every subscriber, at least all those who are in any way interested in club work, read this letter.

Clubs, like us mortals, must be rated by what they accomplish and fine-spun theories do not always work out well. The club concerning which Mrs. Comings writes has accomplished a good work along several lines, probably the most important of which is getting the parents and school children together on a common ground of interest. As reported, the standard of conduct in the neighborhood has been raised as a result of the work of this club, and Mrs. Comings very properly gives credit to a group of young men who have taken charge of the dances in their neighborhood and made them fit for real ladies and gentlemen to attend. The report from the Brunswick Neighborhood Club is a most encouraging one and The Wisconsin Farmer would like to know in what communities in Wisconsin they have been able to equal this record or better it.

Wisconsin Legislature.

Senator Henry E. Roethe writes in his Fennimore Times that the Wisconsin legislature will do well if it gets through with its work before haying or harvest. Many of us are discouraged about any hurried adjournment of the general assembly. But the war has brought up many new matters—matters which in our judgment could have been disposed of with a little less talk. However, we send our assembly 47 to 40, and The Wisconsin to look into things and often the best points of an argument are hidden until the argument gets to the point of an open spatfest. So we will hope that some good will result from all the discussion and delay.

Our readers will be a little surprised to learn that the women's suffrage amendment is not to be submitted after all. On a test vote it passed the assembly 47 to and The Wisconsin Farmer so recorded this fact in a recent issue. But the amendment route to defeat of the amendment was chosen and on the final vote the proposition was defeated 44 to 41—close, but sufficient to put to sleep any chances of women voting in Wisconsin for a few years yet. The Wisconsin Farmer is sorry, for we really believe that women should have the right to vote. Women will work hard the next few years—they have always worked hard. The burdens of war fall especially heavy upon the women. But we will have to look to some subsequent legislature to give them the right of suffrage.

The legislature has agreed to submit the prohibition question to the people of Wisconsin in 1918. Unless Governor Philipp intervenes we will have a chance to vote the state dry next year. The bill was introduced in the legislature by Assemblyman William T. Evjue, of Madison, January 24th. It was reported from committee for indefinite postponement March 15th, the committee vote being 4 to 3. By a vote of 52 to 44 the bill was ordered engrossed by the assembly March 22d, and it was passed by the assembly March 29th by a vote of 55 to 38. The senate committee on state affairs declined to make any recommendation on the bill. The senate vote on final passage was 21 to 1, a better showing for the dries than was expected. The wet and dry question will be submitted to the people of the state in April, 1918.

Many bills of interest to farmers and live stock breeders are still hanging fire in the legislature. However, the committee and the state officers have been in almost daily conference on these bills and some of the best of the measures will pass. The tuberculosis bill has undergone some important changes, increasing the limit of valuation on slaughtered stock, permitting area clean-ups, and the sale of reactors and also of pasteurized milk from reactors. Another added feature gives the state department of agriculture power to establish pastures for reactors where they may be isolated from herds and cared for and put into condition for market. A great many cattle which react under the tuberculosis test may get well under proper treatment and the state department takes the position that this is no time for killing any animal which can be saved. Many of these reacting cows can have perfectly healthy calves, and, as tuberculosis is not hereditary in animals, it is too much of a waste to kill an animal in fair health just because of the reaction. The effort on the part of the state to save as much stock as possible, and to reimburse the farmers on a fair basis, will go a long ways towards popularizing effort to stamp out tuberculosis by law. The accredited herd plan established by Secretary Norgord has been adopted by many of the best breeders of the state.

Daylight-Saving Plan Endorsed.

For the first time the state of Wisconsin is taking up the proposed daylight-saving plan seriously. This plan is now largely in use in Great Britain and other European countries. Under this plan all clocks in a given region on a certain date, about May 15th, are set forward an hour, and on another given date in the fall they are set backward an hour. The effect of this change is to make the day begin an hour earlier in the summer and go back to the old schedule in the fall.

Not a great many farmers would be affected by the change except as they have business with the people in towns and cities. As a rule, the farmer sets his clock forward more than an hour when it comes time for

FAMILY CIRCLE TALKS—By The Publisher.

(Continued from page 3.)

obtaining better prices for their product, when they have graded it and sold it in large quantities by united action. I wish those of my readers who have had experience in such marketing organizations would write and tell me how the plan worked out. This is a most important matter and we could hardly do better, for the next few weeks, than to discuss it together.

FINDS THE BOOK LIST GOOD.

I FIND that interest remains high among my Wisconsin readers in the question of good books to read. Not a mail but brings me either a list of books recommended by some enthusiast, or a request for the name of the publishers and the cost price of some book which another correspondent has recommended. Many of the letters are in line with this one, from Mrs. R. W. Henderson:

Dear Mr. Pierce: I want to thank you for the fine list of books printed by you recently. For fully a year I have been trying to locate "The World I Live In," by Helen Keller, for our school library, as I am clerk of our district board and have most of the book buying to look after. It is one of the books mentioned in the list published by you in that issue. I believe the one entitled "Japanese Girls and Women" would also be a valuable addition to our list. Will you please tell me who publishes these and what they sell for? We now have all of Frank Carpenter's Geographical Readers and in all, including our dictionary and encyclopedia, we have 102 volumes.

Our county superintendent is going to memorize the little "literary prayer" you printed and use it in his lectures. I sent it to him, along with the list of books.

I enclose a stamp for a reply concerning the books. Believe me, I am most gratefully yours, with full appreciation of every good article you write.

Such a letter amply repays me for all my trouble and makes me more than ever anxious to continue this discussion, which so interests me and which I hope will be productive of good results in many and many a Wisconsin farm home. I have sent Mrs. Henderson the information she desires and will render a similar service to whoever calls upon me. If I can help any of my readers to find books which will interest, instruct and entertain them, leaving not a single harmful impression in their minds, I shall have done a good day's work and shall be well satisfied. So, send me your list of books, ask me questions concerning them, and use me in any way which appeals to you. I am at your service.

A FARM HAND'S EXPERIENCE.

WHEN I called for contributions on the subject of the respective merits of single and married farm hands I fancied I might receive some interesting answers, but I was not prepared for the avalanche of splendid letters from Wisconsin readers which has resulted. If the letters continue in the tone of most of those which are coming in now, I shall have to ask the champions of the single men to desist from writing me and the champions of the married men to get busy, for the single man has it over his married brother, a hundred to one, just at present.

Here is one of the best letters of the entire lot, in my opinion. It tells how a farm hand worked and saved until he became a landowner himself, and it champions the single man most ardently, with good facts to back up the choice. This letter was written to me by Mr. W. L. Regester:

Dear Mr. Pierce:—I served as a hired hand for several years, working by the month, by the year and by the day, generally getting $15 per month and board and washing, or $136 by the year, or 75 nts per day when working by the day, and the hours were from 3:30 to 8:00 or 9:00 p. m. and those men, too, let me have a part of the Sunday evenings off. That was along from 1893 to 1900 and in eastern Indiana. In 1900 I went to Oregon, where I worked one year as a sheep herder at $45 per month. There, of course, I got no Sundays off. Will say here I was just about as rich when I quit working out as I was when I began. The only money I had was what I made herding. Then I filed on a quarter section in the wheat belt of eastern Oregon and went to farming. In 1908 I sold out for $4,000 and came east again and bought an improved farm of 125 acres, paying $5,150, leaving me in debt about $1,500 after making the move and stocking up a little. But I have that debt almost paid and have plenty of stock for this size farm. I have had three chances to sell this farm this spring at $7,000.

Now about the hired hand. Of course I know there are lots of men that are no account at any price, but the single man who is willing to work I much prefer, as it isn't every married man that works out that has a congenial family by any means. Then I think one would find that he would be well repaid by the work done the balance of the time if, when there was a slack time, he would just say to the hired man, "Say, John, let's go fishing this afternoon or hunting, or to some picnic," as the case might be, and I just know from experience the hired man would have a kindlier feeling towards you and will do better work.

Now as to waiting until you have a home of your own, etc., before getting married, it is my opinion that the woman would enjoy and really much prefer helping to earn and build that home. In fact I believe the happiest time of their married life will be while they are working and planning together just what kind of a home they intend to have when they get able.

My friends, this is a splendid letter; it is a whole sermon on happiness, marital congeniality and numerous other things which we do well to consider here among ourselves. Such letters make me feel like taking a back seat, while my readers do the talking—perhaps you might call it preaching, sometimes. About all I am doing this week is to introduce the various speakers; I rather fancy the page will be more entertaining than usual, because I am allowing others to do most of the talking.

Continue to write to me on this and other subjects. Together, we can make this page the most interesting any farm paper ever printed. I am not saying this boastfully, for it is you who are supplying the ideas and discussing them, not I. This is as much your page as mine; it is a public forum in which all have an equal voice.

James M. Pierce

---

him to work in the fields. And, as a rule, also he plans to stay by his job in the evening until time for candlelight. The new arrangement would change banking hours, making them an hour earlier, school hours, postoffice hours and bring the rural delivery mail to the farms of the state an hour earlier. It would make church an hour earlier on Sunday during the summer months, and we suppose it would have a tendency toward starting the young lady's best man homeward an hour earlier. As to this we are not certain unless mother taps her shoe on the floor by the time of the clock.

Most people get up earlier in the summer. Only the lazy man wants to snooze after the sun begins shining in his windows. The change in time would permit business people to get through with their work and have more time for recreation and work in the garden. For these reasons the people in the cities and towns would be benefited. The joy-riding parties into the country would get an earlier start and we should hope they would be able to get back into town in time for honest farmers to get a good night's rest.

Farmers' Side of Milk Prices.

Madison has been having what they call a milk war. That is, the people, and the newspapers in particular, have been objecting to an advance in the price of milk from 8 cents a quart to 10 cents a quart. There have been threats on the part of officials that dairymen might be put in jail on the assumption that in a meeting or conference held they had agreed to advance the price of milk on a certain date. Right here it may be well for us to advise our readers that such meetings had best be avoided. Even in cases where an advance is justified, better not have any vote on the matter, as such action is construed, under the law, as a combination to fix prices. The farmer as a rule knows so little about trusts and combinations that he is not familiar with the very stringent laws which we have in our state and nation on this subject. So beware of concerted action to raise prices, as the county attorney may be on your trail.

But we started out to tell of a rather unusual incident which occurred in connection with the milk muddle in Madison. One well-known Madison citizen gets milk direct from a farmer. He met this farmer at the door one morning and said, "I want to talk to you a minute." Here the farmer no doubt began to fear the worst. But he had been damned by others and was getting used to it.

"You are charging us 8 cents a quart for milk," said this Madison citizen. The farmer admitted it without comment. "Well," continued the purchaser, "I have been watching your milk and I find it is quite clean and wholesome, and that it raises a good, fair amount of cream. I have also been looking up the food value of milk and find that milk at 8 cents a quart, especially good milk like you bring me, is a very cheap article of food. In fact, it is one of the cheapest things we buy. I believe that your milk is well worth 10 cents and I shall have no objection whatever if you begin charging me 10 cents a quart, dating from May 1st, instead of the old rate of 8 cents a quart."

The Wisconsin Farmer has no record as to whether the farmer has recovered from the shock. The incident aptly illustrates how different an attitude some people might take toward the producer at this time. This same Madison citizen walked into a hardware store and heard the merchant kicking on the price of milk. "It doesn't cost any more to raise grass and produce milk than it used to cost," said this merchant. "The farmers are robbing us on this milk business." But the Madison citizen said, "Hold on here, Mr. Merchant. I think I can show you that you don't know what you are talking about. I suppose you imagine that a farmer can stick a cow out in the open country and that the cow will stay inside of certain imaginary chalk lines and eat grass and never run away."

"Oh, no," said the merchant. "There would have to be a fence, of course."

Then the Madison citizen asked the merchant if he didn't sell fencing and the reply was "Yes." It was also discovered that fencing was much higher than it used to be.

"You don't expect the farmer to milk cows without having nice, clean pails and bottles and caps, etc?" was the next question put to the merchant. And it was easily discovered that all these things have advanced in price. Then they discussed the advance in feeds, the advance in agricultural implements used to raise the feeds, the advance in price of land, in everything needed for the home, for building, for comfort or entertainment. Of course, it became plain that the farmer is hit by high costs as much as anyone else.

Where the farmer gets an increased price in milk, commensurate with general increases at this time, the people who buy milk have no legitimate cause to object. Where milk is raised and the farmer is paid the same old price, both the farmer and the people who buy ought to object strenuously. In the particular case at Madison, farmers can send all their milk away if they desire. Chicago or the condensing factories will take every pound of it and pay good prices.

If the farmers decided to send their milk elsewhere, Madison would be very lucky indeed if she got enough good milk at 10 cents a quart.

Root Crops Advised.

The spring drive in Upper Wisconsin is on for a bigger root crop than ever in this year 1917. While the time of planting varies with different seasons, soils and localities, in the main it may be said that not more than two or three weeks at the outside will elapse before it will be too late. The crops to grow are probably best outlined by Professor Delwiche, who writes as follows in one of his bulletins:

There is a variety of roots from which to make a choice. The kind to plant, depends on several factors, such as soil, the kind of stock, and the time of feeding.

Mangels furnish the largest yield per acre. They are comparatively easy to harvest, and keep well, better than either sugar beets or turnips. Mangels are relishd by all classs of stock. They are rather exacting as to soil and cultivation, more so than turnips or rutabagas. They are not so apt to taint the milk when fed to cows, as is the case with turnips or even rutabagas. On the other hand, they are comparatively low in dry matter as will be seen from the table showing the dry matter and digestible nutrients in different kinds of roots and in corn silage, per 100 pounds:

Kind of feed	Dry matter Lbs.	Protein Lbs.	Carbo-hydrate Lbs.	Fat Lbs.
Sugar beets	13.5	1.1	10.2	0.1
Mangels	9.1	1.1	5.4	0.1
Turnips	9.5	1.0	7.2	0.2
Rutabagas	11.4	1.0	8.1	0.2
Carrots	11.4	0.8	7.8	0.2
Silage	20.9	0.9	11.3	0.7

Carrots are high in feeding value and are relished by all kinds of stock, including horses. They are probably adapted to lighter soils than mangels, and are about equal to the latter in cost of production per acre. They yield less per acre, however, and need more care in storage than mangels.

Rutabagas are high in feeding value and yield well on very heavy soils, fully as well as mangels. They cost less to produce than mangels or carrots and may be fed to all classes of stock. They may be planted later than either carrots or mangels, but do not keep as well as mangels, and when not fed judiciously they are apt to taint the milk.

Turnips can be grown on wet land better than either carrots or mangels, so they can be sown nearly a month later. They are not so exacting as to soil requirements, make rapid growth, so need less attention for weeding and are easily harvested. Turnips may be grown often as a catch crop on new land, which is also true of rutabagas. On the other hand, they are not as good keepers as the other roots mentioned, are comparatively low in feeding value and taint the milk when given to milk cows, unless fed with care. They are a fine feed for sheep, and in England they are extensively used for that purpose.

On heavy soils in a wet and cold spring like the present there is a possibility of seed rotting in the ground if planted early. On warm, sandy soils there is little danger from this source. For fall feeding rutabagas should be planted not much before June 1st. For catch crops turnips may be as late at July 1st. It is better to delay planting root crops for a few days or even weeks when the ground is wet and cold and in poor working condition. For fields of from one to five acres or over planting should be done with a hand seed drill, but for larger patches a horse row which plants four rows at a time is economical. Test the seed for germination and put in enough to give a good stand. For beets use five or six pounds to the acre; carrots, two to four pounds to the acre; turnips, one to two pounds to the acre; rutabagas somewhat thicker than turnips. Professor Delwiche advises using 20 to 25 per cent more seed unless the seed is known to be of high quality. Root crops should be thinned as soon as they are well up. Delay in thinning is dangerous. Put the boys in the fields, show them how to thin the plants and they can do it as well as a man.

The Wisconsin Farmer advises a liberal planting of root crops through the upper portion of the state. These crops can be cultivated at small expense and they furnish good food and will remain in good condition for a long time in storage. Root crops are valuable for stock feeding and the settler who has a small area cleared will find that they produce abundantly.

The Louisiana sugar crop of 1916 was practically double that of 1915. Figures compiled by the department of agriculture show the 1916 crop was 607,800,000 pounds, and the 1915 crop 275 million pounds. The average cane yield was eighteen tons an acre in 1916 and eleven tons in 1915.

Eau Claire County Farmers' Club.

A Few Good Things Which Have Been Accomplished by Brunswick Neighborhood Club—By Mrs. Mary Huntington Comings.

I HAVE been intending to send The Wisconsin Farmer some matter concerning our club, and am glad to have a chance to join in encouraging this work. Some of the facts contained in this letter I wrote up recently for our local paper and others have come to my mind since. The Brunswick Neighborhood Club was organized two years ago by Mrs. Allen Preston and a small group of neighbors who began meeting at each others' homes on alternate Sunday afternoons. During the first six months a satisfactory organization was evolved, and the attendance got so large that it seemed best to hold the meetings in the schoolhouse. In spite of some opposition this plan has worked out very well, especially since the club purchased dishes and put up cupboards and shelves. During the first year the programs were furnished largely by city people. Special thanks are due our county agent, Mr. Ingalls, for his talks on various agricultural subjects. Also to Miss Lillian Johnson and Mr. R. F. Kaiser, who have been very helpful in trying to aid us in our social center idea. During the past season we had splendid addresses by several of the city pastors, a lecture on local history by W. W. Bartlett, and another on rural educational topics by Superintendent Schulz. Several others spoke for us, including Mr. Ben Faast, Wisconsin's representative on the federal farm loan bank board. While all of these talks were appreciated, the feeling prevailed that we should depend more on our own resources—that we would get more real good out of the club if we took a more active part in the meetings ourselves. This year under the fine leadership of Miss Helen Powell, of District No. 1, the school work and the club programs have been correlated in a very helpful manner. For example, the study of seed corn selection, for one Sunday afternoon, was followed by short talks by the schoolboys on the subject. There was also a corn-judging contest in which the parents and the pupils contested for the ribbons. The study of noxious weeds was followed by a contest of identification of the ordinary weeds which are pests of our farms. The best of the songs, little plays and poems used in the school classes are also used at the regular Sunday afternoon programs. In this way the parents are kept in close touch with the school work and the interest of the children in their work greatly stimulated. In addition to the club programs the club has made an effort to arouse interest in better farming by distributing small packages of alfalfa, Sudan grass and soy bean seed through the neighborhood. Last spring the club distributed 200 Buff Orpington egg settings in the district. We wanted to test out the breed with the hope that if he breed proved satisfactory we could standardize the poultry products of the neighborhood and establish a community egg circle.

Your readers may ask why we have our club meetings on Sunday. First, because in a rural community it is the only time when the parents and the children can conveniently meet. Evening programs which rarely get started before 9 o'clock and which keep the children up until midnight or after, seldom are of any great benefit. Second, because the Sunday meetings do not in any way interfere with church services. Some of the most enthusiastic club members are among those who attend church services the most regularly. In this neighborhood those who have been most violent in their objections to Sunday meetings are those who habitually dance until daylight Sunday morning and patronize the Sunday shows and ball games besides. Sincere religious feeling should always be respected, and no doubt other neighborhoods in Wisconsin might find it advisable to meet some other time than Sunday, or perhaps organize the parents and children in separate groups.

The women of the Brunswick Club have coöperated with the school board in furnishing hot lunches to the school children. Late in the summer the mothers had several canning bees at which fifty quarts of corn and tomatoes were put up. In addition the women are cleaning the schoolhouse every month and turning over the money thus earned to finance the hot lunches.

Affiliated with the Sunday Club is the young people's organization known as the O. A. A. O., which spelled out reads, "One for All—All for One." This club meets at the schoolhouse alternate Saturday nights for dancing and games. The seats have been put on strips of wood so that they can be easily lifted and stacked at one side of the room. Much credit is due the young people who have succeeded in setting a new standard of conduct in a neighborhood which has for fifty years depended largely for social pleasures upon the Saturday night dances at which the young girls as well as the young men often got drunk. Special mention should also be made of the dancing parties given during the past winter by the young men of the Mt. Hope neighborhood. These parties have been held at the Brunswick town hall and the booze and fights which formerly made hall parties a scandal have been conspicuous for their absence. These young men deserve the hearty support of those who are interested in community betterment.

Effect of Turning on Pasture.

In his recently published work, "Productive Dairying," Prof. R. M. Washburn discusses, among other things, the effect of turning cows to pasture on the composition of the milk. The notion is current that milk deteriorates in quality when a change is made from dry feed to pasture in the spring. In order to ascertain the facts of the case thousands of milk tests have been made at the Minnesota station before turning cows to pasture and afterwards. This work has been going on for twenty years with a herd varying from twenty to sixty cows, and tests have been made twice a day. All the principal breeds have been dealt with, including the Guernsey, Holstein, Ayrshire, Short-horn and Brown Swiss.

What was the result? It has been conclusively demonstrated that when well-fed cows are turned onto a pasture there is no decrease in the percentage of fat and milk. On the other hand, taking the whole herd through, there is a slight increase in butter fat. Professor Washburn says that the impression that pasturing lessens the fat content was gained during pioneer days when "spring poor" cows were turned onto bare pastures that did not furnish sufficient food to sustain weight, saying nothing of milk production.

Some Day You'll Need a New Battery

Your battery will wear out some day—all batteries do.

This is perfectly natural, because a storage battery is an electro-chemical apparatus, constantly charging and discharging—never resting. And as time goes on the electrical elements in it wear out.

But the better the battery, and the better its care, the longer it lasts.

Willard doesn't stop with *building* the battery. He follows it—and my job is to assure satisfaction to Willard users. In other words—you not only get the *best quality to start with,* but you can rely upon me— and I'm a battery expert—to help you get the most out of it.

The result is that over 150 car builders use Willard Batteries on their cars, and car dealers are selling them to their customers.

Write to the Willard Storage Battery Company, Cleveland, Ohio, for the booklet, H-5, "What's Your Battery Worth," and list of the 950 Willard Service Stations.

Meanwhile, ask your dealer about the expert service I'm equipped to give you.

The Willard Service Station Man

Willard STORAGE BATTERY

Solves the Shortage of HIRED HELP

Saves Time in Hauling

Hundreds and hundreds of farmers everywhere now solve the shortage of farm labor by using Smith Form-a-Truck for all hauling. This alone saves seven-eighths time on the road.

For a single Smith Form-a-Truck hauls twice the load of two teams. And in one-half the time. An 8-to-1 saving in time.

Tremendous Economies

Save the pay of three drivers in hauling crops, hogs and milk to town One driver and a Smith Form-a-Truck will do all the work of four teams and four drivers. And note these wonderful savings: 12 to 15 miles per gallon of gasoline—6000 to 8000 miles on a set of tires—and practically no repair expense. Where else can you duplicate this economy?

Smith Form-a-Truck will carry 2000 pounds of milk 10 miles and return with the empty cans in less than two hours. And the total cost of the round trip is but $1.50—gasoline, oil, tires and everything. Think of it.

8 Farm Bodies in 1

Change to any one of 8 types of farm bodies is now made instantly with the famous 8-in-1 convertible farm body. Not a single tool is required. Merely pull the lever and change from hog rack body to hay rack body for loose grain—high side flare board body—flat rock body—stock rack body—basket rack body—flat rack scoop board down—or grain body. This is an exclusive Smith Form-a-Truck feature

Choose From 6 Power Plants

Smith Form-a-Truck combines with any Ford, Maxwell, Overland, Dodge Bros., Buick or Chevrolet—either new or used cars—to make a fully guaranteed one-ton truck. When the chassis of these cars is fitted to the Smith Form-a-Truck frame the remarkable strength of these cars is reinforced. You secure double construction—double strength—the strongest construction ever known to engineering. And the rear axles of these cars become jackshafts for the power chain drive. The strong, sturdy Smith Form-a-Truck axle carries 90% of the load.

Send Coupon NOW

You need a Smith Form-a-Truck on your farm NOW—AT ONCE. Keep your horses for farm work. Start saving money immediately by getting the full value of horses. Read the wonderful story of Smith Form-a-Truck in our big book—FREE to farmers. Yours for the coupon. Send it TODAY.

In and Around Wisconsin

WISCONSIN HORTICULTURE advises against broadcasting seed except on soil which is free from weeds and where the crop grown stays in the ground a short period of time. Radishes may be sown broadcast, and also plants which are to be transplanted.

R. L. BRASURE, principal of the Crandon high school, will help John Swenehart, county agent, in his work in Forest county. J. F. Phillips, county superintendent of Taylor county, will also join forces with farmers and business men in aiding County Agent R. A. Kolb.

PROF. GEORGE W. DAVIES, of North Freedom, has been asked to take charge of the farm defense work in this county, at least temporarily. As county superintendent of schools, Professor Davies has actively identified himself with agricultural interests. He has a wide influence among the farmers' club members of his county.

GUS SELL, agricultural instructor in the Omro schools, will assist in Winnebago county defense work, being an assistant to Reid Murray, emergency food agent. L. J. Martell, superintendent of the Brown county schools, has been secured to aid the local committees in his county, under the leadership of E. A. Carncross, agricultural representative.

THE government crop forecast for May places the probable production of winter wheat at 2,030,000 bushels, which is 500,000 more bushels than last year and 300,000 more than the five-year average. Althought Wisconsin does rank high as a winter wheat producing state this is a very good record for a year when a wheat shortage threatens the whole country.

UNDER a new law recently passed by the legislature town and village assessors are required to report direct to Madison, the acreage planted in various crops and number of live stock in their jurisdiction. This will make it possible to have accurate information within a few months and will be of especial advantage in summing up the Badger live stock resources.

THERE is an increased demand for sprayers in Wisconsin, due to the determination of our fruit and potato growers to make yields as big as possible this year. In some cases young men are finding it profitable to secure sprayers and rent orchards for several years. By getting several small orchards and spraying them systematically they will be able to gather a good crop of fruit and the indications are that clean fruit will be worth a good sum this fall

AN effort to put practical coöperation into effect has been started in Fond du Lac county. The county papers will publish list of products which farmers have to sell direct, and they will also publish lists of names of men who are willing to work on farms either all or a part of the time. By these methods it is hoped the farmer will be able to get as good a price for his produce selling direct, and still the people in town will be able to save.

THE acreage of staple crops will be increased in Wisconsin this year, according to a report of the state agricultural commission to the state council for defense. This increase is a response to Governor Philipp's appeal for a greater effort in food production. It is estimated that the corn acreage will be about 10 to 15 per cent larger than usual this year, and the wheat acreage will be 20 or 30 per cent larger. About the usual area will be put in oats, barley and potatoes, but an increase in the land devoted to sugar beets and tobacco is expected.

THE state law relating to fishing has been changed so that May has been added to the months when the fisherman may try for a catch. There are a few restrictions thrown about the new arrangement, however, which our readers will do well to observe. No fisherman may take more than ten pounds a day, except that if he happens to land two big ones he is entitled to take both of them away. The limit is two fish or ten pounds if he catches smaller fish. Fish taken in May cannot be sold or shipped. Fish cannot be taken in May by any means or under any conditions which are prohibited in the regular open season. The open season begins May 30th. The change in the law will permit a good many people to catch fish for food.

IN the city of Grand Rapids seed potatoes were sold at $2.35 a bushel at the cars. This was a big saving. Beans were sold at $10.80 a bushel for seed—a pretty stiff price, but not what some of them are trying to charge. The city of Wausau also aided its people in getting good seed at reduced prices.

POTATO seed was sold in many points in southern Wisconsin at $2.80 per bushel by the state department of agriculture. This was a real help—an actual saving of about $1.20 a bushel. In addition to the saving we believe that the people of the southern part of the state will be well satisfied with the seed. Wisconsin-grown seed of the Rural and Early Ohio varieties should do well any place in the Badger state.

MEMBERS of the Racine County Milk Producers' Association are asking for an increase in milk rates to offset the high cost of feed. Since pastures are growing slowly and mill feed has advanced practically 100 per cent, the milk producers claim that there will be a milk shortage in May and June instead of the usual surplus and that a price of 5 cents a quart is reasonable under the present conditions. Retail milk dealers in that county have taken the matter under consideration.

THAT Rock county stockmen are prepared to produce quality beef in the food emergency campaign is shown by the fact that at a recent Hereford sale in Iowa three animals sired by Bonnie Brae 8th, owned by J. C. Robinson, of The Maples Farm, near Evansville, sold for $9,800. Two of the animals were bulls, an eight year old and a three year old, while the third, a two-year-old heifer, sold for $3,200, being the highest-priced female in the sale. Mr. Robinson is well known throughout the country as a beef producer, and is special adviser for the Wisconsin Boys' Baby Beef Contests, conducted by the state live stock breeders' association.

Meeting of American Jersey Cattle Club.

The forty-ninth annual meeting of the American Jersey Cattle Club, held at the Waldorf-Astoria, on Thursday, May 3d, at which every state but one was represented, disclosed that the year just ended has been the most successful in the history of the club.

The secretary's report showed the finances of the club to be in excellent condition, and also showed a substantial increase in the amount of business transacted. During the year 36,117 Jerseys were entered in the herd register and there were 34,499 transfers recorded, indicating an increase of 17 per cent over the year before in the sale of Jerseys, which is the largest increase in transfers that has been recorded for over twelve years. Eighty-four new members were admitted to the club during the year, bringing the total membership up to 649 against 592 the year previous. There are now 100 applications for membership pending, and it is expected that the club membership will soon be over 700.

A report on extension work brought out the fact that Jersey breeders are boosting the breed and its products more energetically than they have ever done before, and that great results have been attained by the breeders in their respective localities in stimulating interest in the breed. Field workers attended over 500 meetings in the interest of the breed and have been instrumental in organizing many state and local associations. It is planned to carry on this work more vigorously during the coming year.

The food crisis which confronts the nation was brought to the attention of the members and it was unanimously agreed upon that all Jersey breeders should be asked to coöperate with the national food commission and the committee on national defense, in the conservation of food products and for a greater production of dairy foods.

M. D. Munn, of St. Paul, Minnesota, was unanimously re-elected president of the American Jersey Cattle Club; Ed Cary, of Carlton, Oregon; F. J. Bannister, of Kansas City, Missouri; W. Gettys, of Athens, Tennessee, and George Batten, of New Jersey, were elected members of the board of directors for a term of three years. At a meeting of the board of directors following the annual meeting, F. W. Sessions, of Utica, New York, was elected vice president. R. M. Gow was reappointed secretary.

DITCHES and Terraces

Also grade roads, build dykes, levees with

Marlin Farm Ditcher and Grader

Works in any soil. Makes V-shaped ditch or cleans ditches up to 4 feet deep. Does labor of 100 men. All Steel. Reversible, Adjustable. Write for free book and our proposition.

Owensboro Ditcher & Grader Co. Inc. Box 224 Owensboro, Ky.

See page 15. Read The Farmers' Market advertisements. There may be a bargain there for you.

Wisconsin has a lot of concrete country roads. This one is near Appleton, Wis. Built by the Wisconsin Highway Commission. State Highway Engineer, A. R. Hirst, Madison, Wis.

What a Concrete Road Will Do For You

YOU know how strong and lasting concrete is for barn floors, silos and bridges. It's just as good for roads. It gives permanent service. Remember these points:

1. A concrete road brings your farm nearer to market and adds dollars to profits. And this applies not only to farms on the concrete road but to every neighboring farm.

2. Over a concrete road you can haul four times the load that you can over dirt roads out of repair. You can do your hauling in wet weather and your farming in dry weather.

3. Wear and tear on horses, harness and wagons is very much less.

4. You can travel faster; start later; get home earlier.

5. Your family can drive to town any day in the year. They do not have to stay at home waiting for the roads to dry.

6. Your children can go to school in all kinds of weather, and when they grow up they will be content to live at home.

7. Merchants in town can deliver goods to your door.

You have to pay a road tax in your township or county. Why not use it for permanent highways instead of for repairs on impermanent roads.

The way to get concrete roads in your community is to demand them. See that a continuous system of roads is built; not a few stretches scattered about here and there. Our Bulletin No. 136 is full of interesting information. Write for a free copy.

CONCRETE FOR PERMANENCE

Potatoes & Seeds Almost Given Away

TO INTRODUCE, I will send seed for Ten Big Hills Genuine Early Six Weeks Potatoes, Earliest and Best Potato in the world—enormously productive and best keeper. Also 10 Varieties best butter and head Lettuce (1,700 seeds), 5 Varieties best Pop Corn—red, white, blue, rice and gold, splendid for children and chickens. Monster Flower Collection, 300 Varieties, and a splendid Seed Novelty. ALL safely boxed and mailed postpaid for Two Dimes, or 24c in stamps.

All the Seeds and 30 Hills Potatoes for 50 cts. Seeds and 70 Hills $1.00. More at the same rate. This is your last chance. Order to-day, and tell your friends. Address

A. G. COOK (Potato Specialist) HYDE PARK, N. Y.

WANTED CANADA LAND

WOULD like to correspond with parties who own good Canadian land, 320 acres or more. Clear or nearly clear, to exchange for Iowa or Southern Minnesota corn belt farms.

WILLIAM GALLOWAY Waterloo, Iowa.

OREGON & CALIFORNIA RAILROAD CO. grant lands. Title to same revested in United States by act of Congress dated June 9, 1916. Two million three hundred thousand acres to be opened for homesteads and sale. Timber and agricultural lands. Containing some of best land left in United States. Now is the opportune time. Large sectional map showing lands and description of soil, climate, rainfall, elevations, etc. Postpaid one dollar. Grant Lands Locating Co., Box 610, Portland, Oregon.

WANTED TO HEAR FROM OWNER OF GOOD farm for sale. State cash price and description. Address D. F. Bush, Minneapolis, Minnesota.

When writing to advertisers kindly mention The Wisconsin Farmer.

Come Farm in MINNESOTA

Send for 36 page illustrated Northern Minnesota Bulletin. Tells about the wonderful opportunity—literally millions of fertile acres of virgin cut-over land waiting for cultivation. Watered by thousands of lakes unexcelled for dairying, cattle and hog-raising. Wonderful crops of corn and clover. And the cost is small. Upwards of $25 per acre on easy payments.

CURRENT EVENTS

THE British and French on the one side, and the Germans, on the other, are fighting bitterly for every foot of ground in northern France, victory perching first on one banner and then on the other. The allies seem to be pushing the Germans back slowly, but the work is tremendous and extremely costly in human lives. The Germans succeeded in repulsing the allies and recapturing positions at several places in the far-flung line last week, but if the press dispatches are accurate, the Germans are slowly, but surely, being pushed back out of the territory they captured with such a rush in the first week of the war, now almost three years ago. In the meantime, the American congress makes haste slowly in the matter of providing American troops to assist the allies. Congress has not yet granted Theodore Roosevelt the desired permission to raise a force to take across to the battle line. It is arranging to send railroad builders, but there have been no public indications as yet that armed troops will go in the very near future. A dispatch from Paris last week stated that the stars and stripes appeared on the streets there as the battle flag of an armed force when the flag and fifty men of the American field service under it on their way to the railroad station for the front were acclaimed enthusiastically by early risers all along the route. Thirty-one members of the contingent are from Cornell University. This is the first detachment of the American field service to bear arms and it is detailed for the transportation of munitions to the front.

IN order to raise the immense sum of money needed to carry on the war, the ways and means committees of both houses of congress have been at work, for some time past, devising a new schedule of taxes. Last week a war revenue designed to raise $1,800,000,000 by taxation during the coming year was unanimously adopted by the ways and means committee of the lower house. To bring the amount raised up to the desired total, the house committee wrote into the bill a flat increase of 10 per cent in all existing tariff duties and 10 per cent duties on all articles now admitted free, all estimated to bring in $240,000,000, this more than doubling the present tariff revenues. Most of the new revenue will come from the income, excess profits, and inheritance taxes and additional tariff duties, but the levies of the bill would reach into many other sources. Letter mail rates would be increased from 2 to 3 cents an ounce and postal cards from 1 to 2 cents, while $19,000,000 would be added to charges against newspapers under a new system based upon the present parcel post zones. Internal revenue taxes upon liquor and tobacco would be materially increased and there would be taxes on amusements, and stamp taxes of wide scope. The war income tax section would double the present normal tax of 2 per cent on individuals and 3 per cent on corporations. It would lower the exemption of individual incomes from $4,000 to $2,000 in the case of married persons and from $3,000 to $1,000 for the unmarried. The bill has not passed either house as yet, but the extraordinary need of money makes it imperative that some such measure pass without much delay.

THE new government bonds, to be known as the liberty loan, which will be issued shortly, will bear 3½ per cent and will be in denominations ranging from $50 to $100,000. These facts were made public last week by the secretary of the treasury, Mr. McAdoo. It is hoped that the rank and file of the public will take up the bonds, so as to make the loan a widespread one, rather than to let them get into the hands of bond houses and large investors solely. The bonds can be bought on the installment plan as follows: Two per cent of the subscription must be paid on application; the remainder will be paid as follows: June 28th, 18 per cent; July 30th, 20 per cent; August 15th, 30 per cent, and August 30th, 30 per cent. The bonds will be dated June 15th, instead of July 1st, the date previously designated, and the interest will be payable semi-annually on June 15th and December 15th. Two classes of bonds will be issued, coupon and registered. The lowest denomination of registered bonds will be $100, other denominations being $500, $1,000, $5,000, $10,000, $50,000 and $100,000. Coupon bonds, payable to bearer, will be issued in denominations og $50, $100, $500 and $1,000. The forthcoming bond issue will be limited to $2,000,000,000, with treasury certificates to an equal amount to be issued later. Banks throughout the country are subscribing to the liberty loan in large amounts, proposing in turn to sell them to their customers without a cent of profit to themselves. The government needs an immense sum of money and it will be raised by this bond issuance and by the proposed increase in taxation, which will approximate $33 per capita for the entire country.

GENERAL JOFFRE, the French commander to whom is generally given credit for holding the Germans back at the battle of the Marne in the first weeks of the great war, and Vice Premier Viviani, of France, visited the middle West last week and were given a wonderfully enthusiastic reception. Both men delivered notable addresses in Chicago and Springfield, Ill., and St. Louis and Kansas City, Mo., their train stopping en route now and then for short addresses and statements. A floral wreath was laid on the tomb of Lincoln, at Springfield, the same thing having been done at the tomb of Washington, at Mount Vernon, a few days previous. In an eloquent tribute to Lincoln, at Springfield, M. Viviani said: "You know, that born among the people, not able to read, Lincoln arose by study and intelligence to be the emancipator of modern civilization. He attained his ends by plunging the country into civil war after exhausting every other means within his power Lincoln understood human conscience and that is the reason he is proclaimed 'the immortal.' He accomplished this civilization and, although he is now in silence, by his triumphs and his deeds he still lives in memory. Three years ago the German government violated the rights of man without any motive or right, and sought to conquer France. The United States is now face to face with the same crisis. We are now together in this great world war to defend the rights and justice of man." In a public statement the French vice premier declared that the continuation and final success of the war "depends as much on the farmers as on the soldiers and the services rendered by those who cultivate the soil cannot be overestimated."

NINE new regiments of army engineers, to be composed exclusively of highly trained railway men, will be the first American troops sent to France. They will go "at the earliest possible moment," the war department announced, "for work on communication lines." The expedition will have a total strength of between 11,000 and 12,000 men, each regiment being composed of two battalions of three companies each. Every branch of railway workers necessary to the building or operation of lines will be represented and the war department expects a response to the call that will insure a force already trained to the minute, an army of experts in railway operation. Engineering feats of spectacular nature have been accomplished in perfecting these communication lines. A whole British railway was picked up bodily, rolling stock, rails, roadbed and all, and taken to France. American engineers had much to do with that. They also have, under contract with the British and French governments, driven tunnels, built spurs and bridges and mapped out schemes of transportation that are in operation today. America is preëminent in the field of railway engineering and the best talent and experience the nation can provide in that line will go into the new regiments, each of which would be able to undertake all or any part of the work of building or operating a whole railway system.

OFFICIAL wheat crop estimates announced last week show that with the world facing a bread shortage the United States, unless it cuts its present consumption, probably will produce only enough wheat this year to supply its own population. The forecast, compiled by the department of agriculture on conditions May 1st, put this country's winter wheat yield at 366,000,000 bushels, the smallest in thirteen years. There will be no estimate of spring wheat acreage until July, but with a crop of 250,000,000 bushels, which is higher than the average, this country would grow this year a total of only 616,000,000 bushels. The normal American consumption with seed requirements is put at slightly more than 600,000,000 bushels. The allies' wheat requirements for the coming year are put at 500,000,000 bushels as a minimum. The United States will be asked to supply more than half that amount. Wheat crops in other parts of the world are poor. The Argentine crop failed and home consumption will require the entire yield. Canada's production is confined chiefly to a spring crop of normally about 200,000,000 bushels, much of which is available for export. Since the war started America has exported to Europe vast quantities of wheat, reaching a high mark of 332,000,000 bushels in 1915. Last year the total fell to 243,000,000 bushels. Before the war it ran slightly less than 100,000,000 bushels.

Sunday gardening is not a violation of the laws at this time, in the opinion of Governor McCall, of Massachusetts. The governor has been urged by Mayor Curley, of Boston, and others to recommend that the Sunday laws be amended so as to permit persons who work at other employment other days in the week to do a little Sunday work in their vegetable gardens. Section 2, chapter 98, of the revised laws reads in part: "Whoever on the Lord's Day * * * does any manner of labor, business or work, except works of necessity and charity * * * shall be punished by a fine of not more than $50 for each offense." Owing to the fact that the cultivation of every bit of available ground is now being urged as public duty, the governor believes that garden work done by householders is a necessity.

WORN BEARINGS

What do they mean?

THE repair man says: "That knock? Worn bearings." Tightening will temporarily remedy the trouble. Refitting or renewing is the only permanent remedy. But it is more important to know what will help prevent this expensive operation.

To the eye, the surface of a bearing is smooth. But under the microscope it has a very different appearance. You see a succession of little hills and valleys

Now, imagine the engine in motion.

What happens?

Surfaces are in motion. Unless protected by a correct film of lubricating oil, the microscopic hills of metal meet and rub. The engine-power overcomes this resistance, but tiny particles of metal grind off

By degrees the snug fit becomes a loose fit. Noise follows. To correct this condition now, the bearings must be refitted or renewed.

The only protection against undue wear of bearings is the thin film of oil.

This thin film of oil must be highly elastic. It must fill-in the valleys. It must cushion the peaks and withstand pressure. It must stand up under the heat of service. These requirements call for oil of the very highest quality and of the correct body and character.

Gargoyle Mobiloils meet these requirements with scientific exactness. Used as specified in the Chart of Recommendations they effectively cushion the bearing surfaces, and meet the most severe demands of service and heat.

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container. If the dealer has not the grade specified for your car, kindly write our nearest branch, giving dealer's name and address.

GARGOYLE **Mobiloils**

A grade for each type of motor

CORRECT AUTOMOBILE LUBRICATION

Explanation: — The four grades of Gargoyle Mobiloils, for engine lubrication, purified to remove free carbon, are:

Gargoyle Mobiloil "A" **Gargoyle Mobiloil "E"**
Gargoyle Mobiloil "B" **Gargoyle Mobiloil "Arctic"**

In the Chart below, the letter opposite the car indicates the grade of Gargoyle Mobiloils that should be used. For example, "A" means Gargoyle Mobiloil "A," "Arc" means Gargoyle Mobiloil "Arctic" etc. The recommendations cover all models of both pleasure and commercial vehicles unless otherwise noted.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

Domestic Branches: Detroit, Boston, New York, Chicago, Philadelphia, Kansas City, Kan., Minneapolis, Des Moines, Pittsburgh, Indianapolis

Feeding the Dairy Calf.

"Feeding the dairy calf should begin before it is born," says Bulletin 777. "Poorly nourished cows give birth to weak, puny calves which are hard to raise." This bulletin deals mostly with range cattle, that are half starved through the winter, and will not apply literally to our ways and means in the corn belt, where few are the times an animal of any kind is stinted in the feed.

A cow should be well fed previous to bringing a calf, but this point is being so widely advocated at all the prominent institutes and by the bulletins that it is well to sound a warning note to the ones who might take the advice literally. A boy, a level-headed young fellow, heard a lecture of this kind at a state short course, from which he derived a noticeably broader outlook, translated the talk literally, went home and fed a valuable cow too much corn, and she is now in a precarious condition.

A range cow and a dairy cow that has been bred and trained along the highest possible production must not be lumped off in the same class in the matter of care. The former has rather too much exercise with a possible shortage of feed, while the latter is short on exercise enough to often cause her trouble at parturition. Our high-producing cows are more subject to milk fever and need to be fed along conservative lines, with plenty of good, succulent feed to keep them in good health and condition. It would seem that the danger lies in producing too much milk at the start.

Unless a calf or colt gets the first milk of the mother the chances for life are pretty slim. This stimulates the digestive organs and helps to expel the first passage. One of our calves was seemingly all right and was supposed to have sucked directly after birth. After about twenty-four hours it was found with its head drawn back and eyes rolled back, apparently ready to give up the job of living. Some milk was drawn from the cow and forced down its throat as a last desperate resort, with little hope of success. It was a very valuable calf and we especially desired to raise it. Within twenty minutes the bowels evacuated their contents and the little fellow was as lively as a cricket by the next morning.

After the first day we have found it better to take the calf from the dam. There is less fretting, the calf hardly realizing it has a mother, and after a couple of days the cow, if she be well treated, does not worry about her calf—just takes the separation as a matter of course.

The small bossy should have a dry, clean stall kept well bedded. A couple of young calves last winter were kept in a stall of the barn, and towards spring we happened to be at the farm and asked to see them. Such a mess! Wet, dirty, mangy and altogether uncomfortable. Fortunately, they had been well fed, and the owner got ashamed of it all, removed them and cleaned and disinfected the stall before returning them to their own quarters. "They just got to looking so mean that I felt that they were not worth trying to do anything with them," he said. "Thirty-five dollars would have bought them both." Next summer they will be cows and, as they are from a high-producing herd, their value is considerable.

This winter there were two more calves, full mates to the others, and they have been kept looking like pictures. It sometimes requires a like experience to learn the necessary lesson. This may be an opportune time to mention that the two calves this winter were fed commercial calf feed with the most gratifying results.

The bulletin advises that milk from tuberculosis infected cows should be heated to 145 degrees Fahrenheit and held at that degree thirty minutes before being fed. Why not go a step farther and say to discard all tubercular cows?

Pail-fed calves should be fed three times each day, so that there is no danger of overloading the stomach. The bulletin named advises that at birth a fifty-pound calf should have about eight pounds of whole milk a day, while a calf weighing 100 pounds should be allowed twelve pounds. The calf should have the milk from its own mother at least four days, when other milk may be substituted. In our herd is a cow that is giving about the right amount of milk to raise a calf, and as she is rather hard to milk, she is to be utilized to raise a calf from a cow whose time is too valuable for the production of butter fat to waste her time raising babies, and besides, the time saved in milking and feeding an extra calf is considerable. At no distant future date the milking machine will solve the milking of hard cows, as well as the others, on the small farms as well as the extensive ones. Not so very long ago the separator was thought to belong wholly to the special dairy people and today it is as much a matter of course as a sewing machine.

The calf should have whole milk for at least three weeks and a dairy male that is not to be used for breeding purposes is hardly worth it. And especially if the cow be a high producer. It is the heifer that is destined to take her place in the herd, thus making it possible to eliminate the older cows before they go to pieces, that we are dealing with.

Six months is a very good age to wean either calves or colts, but if there is an abundance of skim milk it cannot be utilized to a better advantage than to be fed to a future dependable cow. One calf that came in September was given milk until grass came the next summer, when she was an ideal type of dairy stock. Long, smooth, growthy, with soft, mellow hide. The only trouble is to keep someone from making an offer too tempting to keep her.

There are set times advised in the matter of when and what to feed in the meantime besides milk, but for the average farmer it would be safe to say, begin to feed a little grain as soon as the small bossy will eat it. A handful of oats or bran dropped in the bottom of the pail as soon as the calf is through drinking will encourage it to begin to nibble at an early age, and, once it gets started it will take care of anything you may give it—clover or alfalfa, cracked corn, bran, oats—one part oats, one part wheat bran and three parts cracked corn. This according to the bulletin. Have no fears about giving too much oats. The best of all the young things we grow have oats in unlimited quantities.

The Making of a Good Cow

To the Editor:—We sometimes hear the expression of some good-looking heifer, "She has the making of a good cow in her." It always makes us feel good to have it said of a heifer we own. Next to that is the pleasure of saying it about one owned by some friend.

But it is no easy thing, this making a good cow. The man who sets out to do it may as well make up his mind in the beginning that there is a long road ahead of him, and that there are many crooks and turns, as well as some pitfalls, before he reaches the goal of his ambition.

As the matter has presented itself to me in the course of a good many years of experience, some of the things we have to do to get the good cow we would like to have are these:

First and foremost, a clear idea of what we are working for. What is our ideal cow? Do we want her for milk and butter or for beef, or for both? This should be settled at the very outset.

And then we need to look ourselves over. Have we the patience, the persistence, the capacity to do everything as nearly right as possible? Often failure may very properly be traced to the man and not at all to the cow.

So far, good. Now we may set our stakes to get the best possible ancestors for our good cow. There are two routes open to us here. We may take the cows we have and by grafting them to better stock by and by reach the desired end. Or, we may go into the matter more expensively and invest in cows and a sire that are of known superior qualities. This is the most satisfactory method, provided we are able to do it. The great majority of farmers, however, may not have the ready money to put into an enterprise of this kind. For such there is this word of encouragement. If we take the stock we have and breed up, we have animals that we are acquainted with from start to finish, and

25 CENTS **Calf Rennets** We pay 25c for salted Rennets from milk fed calves. It handled according to directions. The Marschall Dairy Laboratory, Madison, Wis.

this is no slight matter in the dairy economy.

And then in the making of our good cow we may well put kind, sympathetic treatment very high in the scale. Many an otherwise choice cow has been spoiled by having to submit to the careless, harsh and often cruel treatment of a man who has no interest in her. I want good men to handle my good cows while they are in the making. I would rather pay a man a little more if necessary and feel that he will do all his work well, regularly and with a due regard to my interests than to save a few dollars and think that it has cost me ten times what I imagined I was saving in the poor cow I have grown.

One thing more. We may have to work for years before we get our good cow. That is, the heifer we hoped would be the best of her name may turn out rather inferior to our ideal in the beginning. It may be wisdom not to turn her off, but to use her to breed with to a still better sire. So little by little we gain ground. This is a cumulative work. This year we gain a little, next year still more, and so on until at last we may reach a point very near, if not really up to, the standard we have set for ourselves.

All the way along it is highly interesting and instructive. It gives all life a zest and no little happiness.

Producing High-Grade Milk in Summer.

To the Editor:—In the matter of producing high-grade milk it is not knowledge that we need so much as it is the attentiveness to do properly the things we already know. Everybody is agreed that the barns should be cleaned, windows swept down, manure taken from the gutters once each day, cows groomed free from manure, food always kept wholesome, and stale, unconsumed portions removed from the mangers. Good barn management consists in carrying out all these details. During the regular winter routine these things are done reasonably well, but during the rush seasons of planting, cultivating and harvesting the crops the alleys go litter covered, windows become opaque, manure accumulates in the gutters and a general air of neglect is apparent.

Everywhere in this work-a-day world the ideal and practical are far apart. It is easy to say that a thorough grooming is good for the cows, that it is an important thing to do if the best milk is to be obtained, but during the busy seasons most of us will do pretty well if we can find time to brush the loose hairs from the udders and flanks and to pay a little special attention to any flecks of manure that may accumulate. A minute per day per cow spent in this work will keep a good many hairs out of the milk pail and perhaps from the layman's point of view the number of cow hairs per pail is a better standard of purity than the number of bacteria per c. c. Take the well-meaning and well-trained health expert whose standards of cleanliness are laboratory ones and whose principal opportunity is to become acquainted with dairy conditions through an occasional visit to some famous dairy farm. I wonder if he realizes the length of the milk route from the udder to the consumer's table and how many opportunities there are for accidental contamination on the way.

In the production of high-grade milk the small-topped pail is one of the greatest helps where the milking is done by hand. Most of the dirt that gets into milk falls into it and hence the area of the top of the pail is a fairly direct measure of its cleanliness. The chief objection to the use of this sort of pail is that it is somewhat more difficult to keep clean and to handle than the open-topped pail. Let it be said that those contraptions where milking is done into a strainer are a good deal worse than useless. The part of the dirt that is really bad washes through.

Of course, high-grade milk means not only cleanliness in the barn and care in milking but it means clean utensils as well, and no utensil is clean from a bacteriological standard until it has been actually boiled or well steamed with live steam. There is no more prolific source of trouble than a strainer cloth rinsed in warm water and hung over the fence to dry, but the same cloth boiled for a few minutes after washing is clean from the standpoint of the bacteriologist.

There are a few fundamental principles in washing milk utensils. One is that alkalies and carbonates, like soda lye and salsoda, are preferable to soap or soap powders for cleansing purposes. Salsoda dissolves coagulated casein and this gives it a special value for washing up old dirty cans. Still, pails and cans that are well cared for from day to day will not make any great demands upon washing powder.

All pails should be inverted while hot after washing and cans should be laid on their sides or inverted on a slatted rack. They certainly must not be closed tight. There are few worse smells than a fairly clean can that has been shut up tight until it has become musty. But there should be no fairly clean cans. They should be clean. Of course, if steam is not available it is not an easy matter to do many of these things. A teakettle of boiling water is a "vain thing for safety" when it comes actually to sterilizing milk cans and yet thousands of faithful farm wives are doing a pretty fair job with such primitive apparatus.

It is a platitude that the two great factors in the production of milk are "cleanliness and cold" and it might be added that the greatest of these is cold. By this I mean that there is no milk so clean and good but that it will very rapidly spoil at a high temperature, say at 65 degrees or above, though not so rapidly as if it were dirty in the beginning. On the other hand, quite inferior milk will keep in presentable condition for a long time if it can be kept below 45 degrees. In other words, spoiling is a matter of bacterial growth and bacterial growth is a matter of temperature. Fairly good milk below 55 degrees will keep very well and above 65 degrees it changes fast. When the temperature is approached at which it is drawn from the cow it goes at geometrically accelerated speed. On the farm where milk selling is carried on there is then one simple unvarying rule, namely, reduce the temperature of the milk immediately after milking as rapidly and as low as possible and do not allow it to warm up again before it is purchased.

Coming Shows and Sales.

To the Editor:—A feature that has contributed to the interest in purebred cattle association sales is that of a show contest limited to the animals entered in the sale. This plan was originated by the American Short-horn Breeders' Association and has been widely adopted in the various states and districts where Short-horn breeders' associations put on sales.

Secretary Harding, acting for the American Short-horn Society, has offered material encouragement to such shows by offering two trophies for the best bull and the best female in the show, and in addition cash prizes varying in amount with the extent and importance of the show and sale.

The response among breeders gives the assurance that the plan is highly popular. It creates a lively interest and friendly competition among the contributors that is not manifested in association sales where the show feature is not included. It has the definite effect of encouraging the consignors to put their cattle in better salable condition. It raises the standard and in every respect has a useful, constructive effect.

Many a small breeder has enthusiastically fitted his entries for a sale and show of this nature and won prizes who would not be inclined to fit animals for a county, district or state fair. He has something definite to work for in this case. In the first place he converts his animals into cash in the sale and he realizes that a higher price will be encouraged if his offerings are well fitted. He is still further encouraged if he succeeds in winning a prize near the top in the show contest. In addition to this he gains a prestige and a satisfaction if he succeeds in winning. It is a friendly contest that appeals to the sportsmanship of every man and the prize is well worth winning.

The American Short-horn Breeders' Association is inclined to extend this plan of coöperation with district breeders' organizations and encourages such organizations to avail themselves of these advantages. F. D. Tomson.

See That Air Space
See That Double Wall

Note the concrete base and the *wood tires*.

The Wood Tire Hollow Wall Silo is *patented*. It is *different*, and every farmer who is considering buying a silo should make a full investigation of the claims we make for it.

Great Strength—Frost-Proof
Easy to Erect—Lasts a Lifetime

No hoops or guy wires are used, yet only one has ever blown down, and that in a cyclone of unusual violence.

Its simplicity; the ease with which it is put up; the excellent quality of the silage; the freedom from frost; the absence of mouldy silage; the elimination of shrinking, swelling and decay; its long life—these are things that are important.

We have a folder that shows how the WOOD TIRE SILO is built and tells about its many splendid features. This folder is FREE on request. A postal brings it. Write today.

THE WAUKESHA COUNTY
A BREEDERS' SALE—WAUKESHA—MAY 31—

Dr. M. W. Downing & Bro.'s Dispersion

See cuts 1, 7, 13, 14, 8.

Our dispersal of 50 head includes the noted 5-year-old show bull, **Downing Pontiac Butter Man,** 21 of his daughters, 9 A. R. O. daughters of **King Hengerveld Pondyke,** a well-known son of King of the Pontiacs, 8 sons of Downing Pontiac Butter Man, and a son of Dutchland Creamelle Sir Ascalon. **Every female in milk has an A. R. O. record,** the lowest being a 13-lb. yearling. Others run up to 29.55 lbs. and all the heifers are from A. R. O. dams. Twelve of Downing Pontiac Butter Man's daughters and his dam are bred to Concordia De Kol Rag Apple (163748), a **31-lb. son of Rag Apple Korndyke 8th.**

Baird Bros.' Consignment

See cut 5.

Here we have 7 two-year-old heifers out of daughters of **Sir Urmagel Burke,** a 31-lb. bull with a 35-lb. sister; these daughters have records from 18 to 23 lbs. as 4 year olds. The heifers are bred to **King Superba.**

Connell Bros.' Consignment

See cuts 12, 17 and 18.

They are consigning **6 of the best animals** in their herd, including a daughter of a 27-lb. cow. This daughter is bred to their herd sire that is a splendid individual and a **son of Johanna McKinley Segis.** They are also offering a beautiful heifer calf, out of an 18-lb. **daughter of Homestead Jr. De Kol,** and sired by **Count Johanna McKinley.**

Dr. David Roberts' Consignment

See cut 4.

In this offering we have **Queen Schillaard (93154)** with 27.28 lbs. in 7 days and 764.71 lbs. butter, 18,329 lbs. milk in a year. She is bred to **King Superba,** whose dam is the first cow in the United States to have an official yearly record and to hold eight world's records at the close of her year's test. **Queen Schillaard's son,** sired by **King Hengerveld Pondyke** is also consigned. See field note in this issue.

H. H. Earle Dispersion

See cuts 9, 15.

The herd numbering 27 head includes 11 cows and heifers with records from 12 to 23 lbs., 5 daughters of **Fobes Mutual Diploma De Kol, a 25.99-lb. bull,** several daughters of **Friend Ormsby Johanna,** that already has a list of 20 A. R. O. daughters, and the splendid 3-year-old herd sire, **Canary Oak De Kol Homestead 5th,** a 24.60-lb. son of Canary Oak De Kol Homestead. This bull is one of the finest individuals of the sale.

Mielenz Dairy & Produce Co. Consignment

Includes **two young cows** with 18 and 20 lbs. respectively, that are bred to their 30-lb. son of **Rag Apple Korndyke 8th.**

S. B. Lowry's Consignment

Is composed of one well bred animal.

See field note in this issue for more detailed information concerning the sale and various consignments. Write for catalogs to Waukesha County Holstein-Friesian Breeders' Association, Waukesha, Wisconsin.

Downing Pontiac Butter Man (94805) Senior and Grand Champion Bull, Wisconsin State Fair 1916. Consigned by Dr. M. W. Downing & Bro., Waukesha.

Sir Pietertje Ormsby Mercedes 43d. A 34.59-lb. bull, one of Wisconsin's leading bulls, owned by J. J. Reid & Son, Oconomowoc.

Sir Spofford Pietertje Korndyke (156966), a 29.49-lb. bull out of Molly Spofford Pietertje. A show bull consigned by S. G. Cramer, Milwaukee.

Downing Pontiac Nellie (238545), 22.09-lb. senior two-year-old daughter of Downing Pontiac Butter Man. Consigned by Dr. Downing & Bro., Waukesha.

Downing Pontiac Korndyke Noble (205622), by Downing Pontiac Butter Man, and out of a 19-lb. daughter of King Hengerveld Pondyke. Consigned by Dr. Downing & Bro.

Canary Oak De Kol Homestead 5th (140727), by Canary Oak De Kol Homestead, whose three nearest dams have five 30-lb. records. Consigned by H. H. Earle, Eagle.

Downing Pontiac Mercedes Lass (238546), a 20.59-lb junior three-year-old daughter of King Hengerveld Pondyke. Consigned by Dr. Downing & Bro., Waukesha.

Netherland Pauline Johanna (162010), 29.55 lbs. butter, 683.2 lbs. milk, 7 days, and 604.98 lbs. butter, 11,838.6 lbs. milk in a year. Consigned by Dr. M. W. Downing & Bro., Waukesha.

Princess Elva Pearl, one of the best cows in the Earle consignment. Will be fresh about time of the sale. Consigned by H. H. Earle, Eagle.

OLSTEIN BREEDERS' SALE

NE 1—WAUKESHA—OF BREEDING STOCK

S. S. Cramer's Consignment

See cut 3.

Cramer is offering a **29.40-lb. bull,** whose dam has a sister with 3., **a daughter of a 27-lb. cow** due to freshen June 3d, and three other ed heifers bred to **a 31-lb. bull.** See field note in this issue.

S. A. Baird & Son's Consignment

See cut 11.

prises **a 27.35-lb. bull calf** that is an exceptional individual, sired **hland Creamelle Sir Ascalon,** the only bull in the world whose **five dams** average **27,000 lbs.** milk and **1,000 lbs.** butter and a **23-lb. 3 l,** with a daughter having a yearly record of **20,000 lbs. milk** and **butter,** bred to Dutchland Creamelle Sir Ascalon so as to freshen me of sale.

D. J. Howell's Consignment

See cut 10.

4.75-lb. two year old, bred to a 31-lb. bull, and a 20-lb. daughter of **agel Burke,** bred to a 31-lb. bull, are included in Mr. Howell's con- t.

George Carroll's Consignment

ains a choice cow and her daughter, carrying strong lines of breed- l nicely marked.

Fred Pabst's Consignment

See cut 6.

Mr. Pabst is offering a son of his $12,500.00 bull, **Korndyke Segis Johanna,** whose sire is the great 40-lb. bull, **Johanna McKinley Segis,** and out of **Pabst Blackberry with 31.5 lbs.** at 3½ years, a cow that represents one of the best families in Mr. Pabst's herd. **His full brother** sold at auction a year ago for $1,650.00.

John J. Reid & Son's Consignment

See cut 2.

They are offering several females, including a daughter of a 27-lb. cow, bred to **Sir Pietertje Ormsby Mercedes 13d,** one of Wisconsin's leading sires. His dam has 34 lb., three records above 31 lbs., and the world's record for three consecutive years' production.

Dreyer Bros.' Consignment

They are offering an 18-lb. daughter of **Sir Ormagel Burke** and her two daughters.

Schley Bros.' Consignment

Schley Bros., Waukesha County, four head, see cut No. 16—a splendid offering.

Roads Lead to **WAUKESHA, MAY 31-JUNE 1** Auctioneers: Haeger, Love, Ball and Benjamin. S. T. Wood in the box.

oberts Queen Schillaard Pontiac (197505), by Hengerveld Pondyke, and out of Queen Schil- d, 27.28 lbs. 7 days, 764.71 lbs. in a year. Con- ed by Dr. David Roberts, Waukesha.

King Superba 176125, out of Milanhurst America De Kol, that has held eight world's records. **Baird** Bros. are offering seven head bred to him.

A 31.68-lb. son of Korndyke Segis Johanna (127132), a 38-lb. bull sired by the 40-lb. bull, Johanna McKinley Segis, and Pabst Blackberry. Consigned by Fred Pabst, Oconomowoc.

rookvale Ormsby Korndyke (254245), 24.75 lbs. two year old, sired by Hillvale Sir Ormsby (10- R. O. daughters). Consigned by D. J. Howell, kesha.

27-35-lb. son of Dutchland Creamelle Sir Ascalon, whose five nearest dams average 27,000 lbs. milk, 1,000 lbs. butter. Consigned by S. A. Baird & Son, Waukesha.

Count Johanna McKinley, by Johanna McKinley Segis, and out of an A. R. O. daughter of King of the Pontiacs. Owned by Connell Bros., Colgate.

bst King Pontiac Lad (129298), a 30.38-lb. whose dam finished recently with about a 950-lb. . Owned by Schley Bros., Waukesha.

A choice heifer by Count Johanna McKinley and out of an A. R. O. daughter of Homestead Jr. De Kol. Consigned by Connell Bros., Colgate.

Count Johanna McKinley, two two year olds bred to him and two of his heifer calves. The four heifers are consigned by Connell Bros., Colgate.

Educating "White Collar" Brigade

Women Can Help Counteract Wrong Ideas As to Farming —By J. F. Sievers, Milwaukee County School of Agriculture.

[Editor's Note.—By special request Mr. Sievers has arranged for The Wisconsin Farmer a portion of his address to the League of Patriotic Women. In this address Professor Sievers pays his compliments to the present educational system fitting young men for "white collar" jobs, and failing to emphasize the dignity of farming as a profession or business. Professor Sievers' ideas are worthy of careful thought.]

I FEEL that there are two distinct ways in which the women of this nation can help in our national food emergency. One is permanent and the other is of a more temporary nature.

In regard to the first I will say that the present apparent shortage in our food supply as indicated by the high cost of farm products is perhaps primarily due to the fact that the rural population in this country has hardly held its own during the last ten years; in fact, we find by referring to government statistics that some of our leading agricultural states have actually had a falling off in their rural population. When we consider that this condition obtains when history tells us that our population in this country doubles every twenty-five years, it is not very hard for the individual who has average intelligence to conclude that we must by some means promote conditions that will keep our young people on the farm and also induce some of those raised in the city to become interested in farm work.

This is an educational problem and when it comes to matters pertaining to education I think that the American women have done more toward promoting that line of our national development than any other agency. The fact of the matter is that in our entire educational system we have up to date paid very little attention to the importance of the farm industry. Our entire city school system offers nothing of a practical nature that pertains to farm life or any of its activities.

In our rural schools we have chosen for our teachers men and women who have held up to the younger generation standards which meant to the youth that a career which did not permit him to wear a white collar every day in the week, or a training that did not permit him to enter one of the professions, was not worthy of his consideration. That our teachers have held up these standards I think will be borne out by the fact that very few of the men who devote some of their time to educational work in our rural districts, and women, too, have ever returned to the farm. Besides this we have been in the habit, and this is also educational, of picturing our farmers on the front pages of newspapers and magazines as a hay-seed with long flowing beard and hay growing out of their ears. This kind of pictures and this sort of ridicule have not had very much effect on the mature and established farmer, but it has not done much toward encouraging the younger people to enter the farm occupation.

Under our present system of education we find that a farmer who is big-hearted enough to send his boy through high school takes the chance of educating him away from the farm.

Our national government appreciates the bigness of this problem and in consequence is appropriating large sums of money for special agricultural education in our secondary schools. This kind of education is still very unpopular, due to a biased state of mind on the part of most people and also due to a lack of understanding. For this reason the moral support of the women of this country who have the time and energy and ability to give a social problem of this kind thorough consideration will do a great deal toward straightening out this unbalanced condition of society.

Two solutions of the present food problem have been suggested, one to induce the farmer to farm more intensively and the other to boycott farm products and thereby bring about a decrease in price.

In regard to the first I will say that the farmer needs no such inducement. He is well aware of the fact that if he farms more thoroughly and more scientifically that he could easily produce more products per acre. He has sufficient information at hand to bring about better agricultural conditions, but he is in sore need of the labor necessary to carry out this plan.

There used to be a time when there was "nobody on the old farm here but mother, me and John, except, of course, the extra help when harvest time comes on." Later there was "nobody on the old farm but mother, me and John" and since the farmer has made an effort to send his boy to high school, there is "nobody on the farm but mother and me," and mother and me haven't the time to farm intensively.

Our present shortage of labor on the farm requires that the farmer himself, who should primarily be a manager of not only his labor but that of two or three extra men, is looking after all minor details of producing the crop and consequently the cost of production becomes very high. We would have exactly the same situation in regard to products turned out by our factories if men who are qualified to superintend the plant had to be called upon to operate the actual machinery, a condition brought about by a shortage of labor.

In regard to boycott I will say that it is very evident that such action would, instead of offering relief, make conditions much more intense. This action, instead of encouraging more people to go into the farming occupation, would tend to discourage those that are already interested. The opportunity that the women of the nation have at the present time to help in solving this great national problem is before them as an entering wedge in the form of vast tracts of vacant property within the county limits that are in need of cultivation. It will bring home to our citizens the fact that we are surely beginning to appreciate that the American citizen, no matter how prosperous he may be, is after all entirely dependent upon the production of the land. I feel, and feel it keenly, that this work of aiding to increase the nation's food supply will require as great a display of patriotism as could be displayed in any other way, shape or manner. A good share of your patriotism will be demanded to overcome the sneers and criticism that your work may receive from a large mass of unthinking people who are ready and anxious to watch your work very keenly, and if there should be a failure in any one of the details, to give you very severe criticism. The bigness of your work should not be entirely based on the number of bushels of potatoes that you may produce, but upon the value that you have given to the nation in impressing upon its individuals the fact that this food problem is intense enough to deserve the consideration of a large class of people who would ordinarily be considered comparatively independent.

THERE'S as much difference between tobaccos as there is between sugar canes—the more sap there is in the leaf to start with, the longer it takes before the last drop of goodness is used up. W-B CUT is shredded; so that the *satisfaction*, stored in the rich, sappy tobacco, comes along easy, without so much chewing. When you chew W-B CUT, you are chewing *tobacco*.

ARE YOU GOING TO BUY LAND?

IF so, get a copy of our journal first. It has lands, city property and stocks of goods advertised in its columns from nearly every state, so that you can find just what you're looking for in its columns. Established 19 years and reaches 76,200 readers. Send 25c for one year's subscription or $1.00 for five years. Department F. Farm and Real Estate Journal, Traer, Iowa.

READ this! We have for sale a small lot of cream separators of a standard make, brand new, latest model, never unboxed. Will sell in single lots for less than you can buy from the mail order houses. Machines guaranteed. Repairs supplied. Write for information. Starch Bros. Co., La Crosse, Wis.

GOLDEN Glow seed corn, kiln dried, 98% germination; $3 per bu. Order from producer. Get descriptions. Riley Martiny & Son, Baraboo, Wis.

Bean Planting in Early June.

There Is Still Time to Put in a Good Bean Crop Following Corn Planting—By R. A. Moore, Wisconsin Station.

THIS year the exceedingly high price of potatoes will encourage many to plant beans. We need more beans to help supply Uncle Sam's army. I believe that beans well tilled will bring the farmer a good profit this year. Seed beans will cost $4 to $5 per acre, while potato seed will run $30 to $40 per acre. An average yield of beans is eleven bushels per acre, while with good care beans ought to produce twenty bushels to the acre. Wisconsin has only about 15,000 acres in beans annually. It ought to be easy to more than double this this year. Sandy and sand loam soils are best adapted to beans. Ten to twelve counties in the central part of the state, and the lighter soils northwest and northeast of this central section, are especially adapted to this crop. The navy bean is the variety most generally grown in our state, though the kidney beans, black, brown and white, are also grown to some extent. In a time like this I advise sticking to the navy bean, as we know and understand it best.

Prepare the ground thoroughly. If it was plowed in the fall, spring disking followed by a fine-tooth harrow will help make a good dust mulch. Spring plowing is best on the sandy soils. Harrowing will kill many of the weeds and make cultivation easier. The mulch aids in warming up the soil. Harrowing weekly will sprout many of the weed seeds and, of course, it is always best to get the weed early in the season. Beans do best in rotation, following clover if possible. They can also be grown to good advantage following corn, peas, potatoes, but should not be grown on the same land for several years. The frosts last fall may have weakened the growing power of your seed, so it is best to test the seed. It is easy to make the test. Take a pie tin and place in it a piece of old flannel which has been boiled to disinfect it. Blotting paper will do if the flannel is not at hand. Put seventy-five to 100 beans on the flannel and cover with another dampened piece. Cover with another pie tin and put in a warm place. After six days count the beans which grew. Keep the flannel well moistened, but not too wet. Keep the beans at a good growing temperature—not too hot. It is much cheaper to sprout a few beans before planting than to sit around after planting to see whether they will grow. Bean planting should follow corn planting early in June. Be sure to wait until all danger of late frosts is passed. In Wisconsin the first ten days in June are the bean planting days.

Beans should be drilled in rows from twenty-four to thirty inches apart. Drop the beans about four inches apart in the row, using about a half bushel of seed to the acre. If grain drill is used close some of the holes so that the rows are planted at the proper distance. Some farmers plant with a corn planter or garden drill. If possible run the rows north and south to let in the sunlight. Watch the depth of the planting carefully. In light soils the seed may be planted as deep as three inches; in heavy soils an inch or two is about right.

If you did a good job of harrowing and the weeds were killed, you can wait until the beans are nicely above ground before attempting to cultivate. Cultivate shallow as the bean roots are near the surface of the ground. The best cultivation for beans is before they are planted.

Here's a "tip" about cultivating: Wait until the moisture is off the leaves before starting in. Dirt scattered on the leaves will usually cause the leaves to rot, reducing the leaf surface. The dirt won't stick if the leaves are dry. Cultivation while wet also distributes the anthracnose and blight diseases.

If you just have a few acres of beans they can be pulled very readily and stacked in the field. They are often cut with a mower, though this means some waste from shelling. Where a large acreage is grown a bean harvester is needed. This machine has knives which cut the stems just below the ground where they are soft. Two rows can be harvested at one time and the machine throws them together. After drying for a day or two cock in small piles for further curing, then haul to the barn and store or stack. Stacked beans need a covering of some kind to prevent the rain from discoloring, which materially reduces price. Beans should be left to ripen well before harvesting and then cut or pulled during dry weather.

Beans can be threshed with regular grain threshers if the machine is provided with blank concaves to prevent splitting the beans. Special bean threshers are generally used if obtainable.

Beans keep well in storage. A shallow bin is a good thing to put them in. If they are damp, shovel them over a time or two until they are dry. One of the beans' best qualities is that they can be stored for several years if kept dry.

Blight and rust (anthacnose) are among the few diseases which trouble beans. These diseases, however, generally occur where beans have been grown several years without thought of a rotation. The bean weevil also affects beans to some extent, but there is little danger in sections of the state where beans have not been grown as a general crop. Clean, hand-picked seed is the best disease preventive.

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 15.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Caponizing Is Real Conservation.

The secretary of agriculture and many other government officials, as well as the agricultural boards of various states, have directed attention to the fact that it is absolutely essential that every effort possible should be made to increase the amount of foodstuffs raised in America. The fact has been emphasized strongly by prominent officials that the success of America in the present war depends upon the food produced and that every method of producing food supply should be carried out along the most efficient lines possible.

It is not necessary to direct attention to the increasing cost of poultry feed. The general tendency among poultrymen has been to say, "Yes, we know that, but with the increase of price on chickens and eggs we are still satisfied." Has the average poultryman stopped to consider that the corn crop of 1916, when nearly all Europe was looking to America for corn, was short over 400,000,000 bushels in America? Does he realize that, according to the department of agriculture in Washington, the average condition of the wheat crop on April 1, 1917, is the lowest ever recorded on that date? Although the American acreage was nearly the largest ever sown to winter wheat, on this one crop alone there is a shortage of over 50,000,000 bushels in the United States alone, while international reports show that a wheat shortage is general all over the world.

The situation offers the biggest opportunity to the live poultryman that he has had for many a year, an opportunity to make money and accomplish a patriotic service. Each rooster or cockerel that is killed at a weight of four pounds or thereabouts has consumed as much feed as it would have required to raise that same cockerel into a capon weighing seven and one-half or eight pounds and bringing in most markets practically twice as much per pound as the cockerel could bring.

A lively, active rooster is a fighting machine, not a profit machine. His comb, his spur, his crow and his high opinion of himself all are without value when he is killed, dressed and sent to market. Caponize him in his youth and he becomes a profit machine. He adds weight twice as quickly at a less food cost. He may not have a high standing in the chicken yard, but when he comes to market he is double weight and double price per pound.

Some of our readers will ask why caponizing has not been more generally practiced in America if it has all these advantages. The answer is easy. Land has been plentiful in America, poultry feed cheap and it is only those who have brought their poultry farms to the best business basis who have realized what a big advantage there was in caponizing. This year, with the increased cost of feed, that advantage becomes greater.

Caponizing is as old as Chinese history and is in broadest use in those parts of Europe where feed prices have ruled high. It is sure to be more broadly adopted in America each year as a means of making small crops of feed turn into large amounts of food for the American population. It is an essential to present conditions. There cannot be too many poultrymen engaged in caponizing, for the increased food value of each pound of capon flesh, as well as its greater delicacy, assures always a high price per pound in the market, to say nothing of the double number of pounds from the same feed. Caponizing is easy to learn. Any woman can do it and the caponized bird is easier to raise and easier to sell at a bigger profit.

The Wisconsin Farmer will be pleased to put its readers in touch with those who sell caponizing instruments. With these instruments will go a full treatise dealing with the practice of caponizing, illustrated in such a way that the novice under this instruction can caponize a large number with practically no losses.

Feeding Baby Chicks.

To the Editor:—We have been quite successful raising chicks not because we are well supplied with coops and other conveniences, but because we are very careful to always keep them warm and dry and to feed as our experience has taught us. We do not feed little chicks until they are thirty-six to forty-eight hours old. We take them from nests or incubator and put in a box, the bottom of which is covered with fine, dry sand. Let them pick at the sand. Then start them on cottage cheese with a little black pepper in it. Give them all they will eat three to five times daily. Always have plenty of clean water before them. We feed after they are four days old cottage cheese once a day and fine chick feed three times daily for two weeks. The cheese is good to feed all the time until the chick matures, as it is a fine growing feed and has an acid that kills white diarrhea. After they are two weeks old we feed some bran, chick feed and have them out on range, and always take care to get them in out of rains.

This is a simple formula, but we find it good. Some who are bothered with losing chicks should try it. Beware of lice and mites and remember cleanliness plays a great part.

A. Breeder.

Appropriation of $10,000,000 for purchase by the government of nitrates for fertilizing purposes and their distribution at cost to farmers of the Atlantic seaboard would be authorized by a bill passed by the United States Senate, 52 to 8. Increase in production of food crops, mostly in South Atlantic states, is the object sought. The bill provides for transportation of nitrates from Chile in government vessels and their sale by federal authorities to farmers. Many southern farmers and agricultural organizations indorsed the measure. Senators Smith, of South Carolina, and Smith, of Georgia, told the senate that the government could buy nitrates now stored in this country, sell them to the farmers and later replace them by bringing in more from Chile. Several senators who expressed fear that nitrate supplies needed for manufacture of powder might be depleted were told that the present supplies are sufficient for two years. The South Carolina senator said that by making nitrates available at reduced prices the corn and cotton crops of the South Atlantic seaboard could be increased from 50 to 100 per cent.

POULTRY AND PET STOCK.

HATCHING EGGS

S. C. RHODE Island Reds; from standard-bred laying stock; $1.50 per 15 or $7.50 per 100; $2.50 per 15 or $10 per 100 eggs; exhibition stock $5 and $10 per 15 eggs. Winnebago Poultry Yards, R. 23, Omro, Wis. A. J. Schloerb, Mgr.

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892; eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

RHODE ISLAND RED HATCHING EGGS—From my heavy winter-laying, money-making strain. Our production double for 1917 season. Quick shipment anywhere. $1.50 per 15. R. E. Daly Poultry Farm, Necedah, Wis.

HATCHING EGGS; prize-winning S.C. Reds. White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W.F., Fond du Lac, Wis.

BABY CHICKS and eggs from trap nested, pedigreed Barred Rocks and S.C. White Leghorns with wonderful egg records. Write for circular to Amos G. Norman, Dept. D, Chatsworth, Illinois.

WRITE for low price on best thoroughbred poultry and pigeons, eggs and baby chix, ducks, incubators, brooders. Address Iowa Poultry Farms, Inc., Box 414, Clinton, Iowa.

HATCHING EGGS; S. C. Reds, prize-winners all leading shows. Eggs 1.50, 15; 8, 100. Order from this ad. Address C. L. Pre-Fontaine, Box 600, Fond du Lac, Wisconsin.

RHODE ISLAND REDS—Setting of 15 eggs from pure-bred prize-winning Rhode Island Reds, $2 per setting; three settings for $5. Hildebrandt & Vea, Stoughton, Wis.

MAMMOTH BRONZE TURKEY EGGS, 25c ea. Mrs. Peter Milfried, Cazenovia, Wis.

BADGER POULTRY FARM—Pure-bred S. C. White Leghorn eggs: $1.25 per 15 or $5, 100. Chas. F. Kreger, R. 3, Box 36, Cambria, Wis.

FIFTY varieties chickens, ducks, geese, turkeys guineas. Low prices to make room. Catalog free. Dell Walrath, Box S, Janesville, Minn.

PURE-BRED White and Barred Rock chicks, 15 cents each. Eggs: $1.00 per 15, $5.00 a hundred. Mrs. J. F. Bloom, Stillwater, Minn.

EGGS—BABY CHICKS: 20 varieties. Safe delivery guaranteed. Catalog free. Miller Poultry Farm, Box E, Lancaster, Missouri.

SINGLE Comb Buff Leghorn eggs from first-class stock at $1.00 per 15, 100, $4.50. Charles Schmit, Hortonville, Wisconsin.

WINTER-LAY ROSE COMB RED eggs: 24, $1.50; 48, $2.50; 120, $5.75. J. M. White, Twin Lakes, Minn.

POULTRY AND PET STOCK.

BABY chicks from standard-bred, Single Comb White and Brown Leghorns, $10 per 100; $90 per 1,000. Bred to lay large white eggs. Safe arrival guaranteed. Catalog free. Wolverine Hatchery, Box 2221, Zeeland, Mich.

WINTER-laying Single Comb White Leghorns. Eggs from high producers mated to pedigree cockerels, certified by University Poultry Department. Certified Egg Farm, Madison, Wisconsin.

BABY chicks from large winter laying S. C. White Leghorns, $12 per 100. Eggs, $5 per 100. 90% fertile. Richard Schwartz, Lomira, Wis.

AIREDALE pups. Imported stock. The best all round dog. Reasonable. Wm. Macaulay, Tremonpleau, Wis.

DARK Single Comb Reds, 15 eggs, $1.25; 30, $2.25, postpaid. Chris Miller, Plainfield, Wis.

FULLBLOOD Scotch Collie pups for sale at farmers' prices. J. V. Northrup, Waupun, Wis.

PURE-Bred White Rocks. Address Kremers', Whitehall, Wisconsin.

ITALIAN bees; Barred Plymouth Rock eggs, 15, $1.00. Elias Fox, Union Center, Wis.

LAND CLEARING.

EXPERT LAND CLEARING contractor, 15 years' experience; has four months open time, June to September. Contracts taken for tracts from 25 to 1,000 acres. Land cleared ready for plow, under guarantee of lowest cost. If you want your land cleared on business basis and at less expense than you could do it in any other way, write at once, giving full particulars. P. R. Cunningham, Mgr., Box 359, Escanaba, Mich.

GUERNSEY CATTLE.

REGISTERED Guernseys, both sexes; also few grade cows; satisfaction guaranteed. Clovernook Farm, Whitefish Bay, Wis.

CHESTER WHITE PIGS.

CHESTER White fall pigs sired by W. B.'s Wonder now ready to ship. Wm. F. Belda, De Forest, Wisconsin.

FARM WANTED.

WOULD like to buy good sized farm direct from owner. Give description. B. Portner, Box 754, Chicago.

SAVE MONEY ON LUMBER.

SAVE money on your lumber bill. Write us. Pacific Coast Sawmill Co., Portland, Oregon

Our Farm Help Column

The Wisconsin Farmer is in receipt of so many applications from employment bureaus for positions on farms that it is not possible to publish them all. Our readers who have not yet been supplied with farm help should write the State Free Employment Bureau either at Milwaukee, Oshkosh, Superior, La Crosse or Madison. This is probably the quickest way to get help and the people in charge of these agencies have had considerable experience in picking out good men for farms. We are listing this week only those who have written to us personally and have not applied through any of the other agencies:

FARM JOBS WANTED.

Man and wife want place to work on shares by the year. Lock Box 605, Monticello, Iowa.

Floyd Lee Martin, P. O. Box 131, Worthington, Iowa. Experienced, $45 per month.

HELP WANTED.

H. P. Olson, Colfax, Wis., R. F. D. 5. General farm hand. Scandinavian preferred. Wages, $30. Six months' work. Small farm.

Man and wife wanted. Mrs. F. Frinnel, Liscomb, Iowa.

POTATOES FOR EVERYBODY.

I hope no reader will miss my Special Potato and Rare Seed Offer on page 8. This trial offer is made to secure thousands of new customers and friends.—A. G. Cook.—Adv.

Ask your neighbor to subscribe for The Wisconsin Farmer.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

FARM LANDS.

NORTH DAKOTA is especially an agricultural state. In the past five years it ranked first in production of wheat twice, twice it was second and once third; always first in production of spring wheat; also flax, equaling production of all other states. Once it was first in barley, never below third; never below seventh in rye and oats. Has made great increase in corn and stock. You can still obtain home there without commission to us, while land is still cheap. Easy terms. Write AT ONCE, for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Building, Minneapolis, Minn.

LOW-PRICED cut-over land from our company, the owners, direct to you and on terms to suit, in this ideal dairy country. You should see Rusk county before you locate, because nowhere else will the same money locate you so favorably, with every advantage, schools, churches, railroads, good markets near, and crops sure. Our company wants you to locate on its lands and will treat you right. Address Flambeau River Lumber Co., Station D, Ladysmith, Wisconsin.

TO HELP INCREASE the country's volume of grains and other food products I am offering to sell about 5,000 acres choice agricultural lands near the cities of Superior and Duluth in 40, 80 and 160-acre tracts at low prices and on five to ten years' time, without any payment whatever on principal for two years, to any one who will clear and cultivate a part of the land at once. For full particulars write to W. H. Webb, Superior, Wis.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, Land Department, Stanley, Wis.

FREE—We are interested in seeing the low-priced farm lands around our home developed. If you are looking for land, just write me and say: "Without any cost to me, tell me how you got your farm home." Address Mrs. Lucy L. Ferguson, B-26, Cedarville, Marinette county, Wis.

SECURE war prices for farm products, buy a farm. Here are a few bargains: 85 acres, 80-acre clearing, buildings, $3,500. 80-acre fine farm, buildings, $3,500. 40-acre, good home, $2,000. 120-acre, good farm, $2,800. The E. L. C. Co., Dept. 10A, Merrill, Wis.

FOR SALE—I have several fine farms, with good buildings, which I can rent or sell very cheap at the present time. If you want a small or large farm in a good location, with good markets, write to or call on Cor. De Keyzer, Holland, Mich., for his free farm catalog.

LAND of clover, Rusk county, Wisconsin. Choice farms in rich, new dairy district, cleared and uncleared. Climate ideal. Rainfall abundant. Grasses luxuriant. Terms easy. Prices low. Folder free. Manning & Swaim, Ladysmith, Wisconsin.

$300 CASH DOWN will handle this 40-acre stock farm, only 2½ miles town, 12 cleared, balance easily cleared; touches small lake, house, barn, chicken house, well. Price only $1,500. Terms. C. M. Melberg, Lewis, Polk county, Wisconsin.

LAND clearing made easy; tells about stump removal by modern machinery. Write for it today, and other facts about cheap upper Wisconsin land. Wisconsin Advancement Association, 1590 First National Bank Bldg., Milwaukee, Wis.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

GOOD corn, clover and grain land; improved, partially improved, or unimproved, at prices ranging from $15 to $100 per acre; best of location and soil. Write us now. W. E. WEBSTER, Hudson, Wis.

A BARGAIN—100 acres fine land, one-half mile from town. Situated in finest farming district in Michigan. Must be sold at once. J. Christiansen, Pontiac, Mich.

FOR SALE—Choice, well-located fruit ranches, Lake Shore drive, Berrien county. Address Schulz, St. Joseph, Mich.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 306-28 W. Jackson Boulevard, Chicago.

SEEDS.

FREE SEED CORN, samples and circular. Northern home grown, hanger dried, heaviest yielding, early varieties. W. C. Bryant, Princeton, Illinois.

GOLDEN GLOW SEED CORN, $3 per bu. Clark's Yellow Dent, $3.50 per bu. Ear or shelled. 98% germination. BURTON Plock, Spring Green, Wisconsin.

BLACK Hills alfalfa seed, $6.00 per bu. For sample seed stamp to Brookside Farm, Buffalo Gap, So. Dak.

EARLY YELLOW DENT SEED CORN; germination 99. Arthur Popp, Jefferson, Wis.

GOVERNMENT JOBS.

FARMERS wanted $75 month; men and women, U. S. government jobs. War means hundreds vacancies. Common sense education sufficient. Write immediately for list positions now obtainable. Franklin Institute, Dept. C176, Rochester, N. Y.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

AGENTS WANTED.

AGENTS WANTED—Wanted, county agents for Oxo Gas Burners. Fit any cook stove. Use kerosene. Superior to coal or gas at fraction of cost. Radle, 20 East Jackson Boulevard, Chicago, Illinois.

HOLSTEIN-FRIESIAN CATTLE.

FINE registered Holsteins, 2 cows, 2 yearlings and 2 calves; 2 of their dams averaged 100 lbs. milk in one day and 30 lbs. butter in seven days, officially. Wisconsin Live Stock Association, Appleton, Wis.

THE HOME

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

Water Glass or Limewater For Preserving Eggs.

Now is the time when the thrifty housewife puts away in water glass or limewater eggs for next autumn and winter. This cannot be carelessly done if success is to be attained.

The first thing of importance is to have the eggs fresh, those not more than two or three days old being best. If possible to obtain them, infertile eggs are desirable. The shells must be clean and should be so when taken from the nest, as washing an egg with a soiled shell lessens its keeping quality, the water removing the gelatinous covering over the shell. Be sure, also, that there is not even the tiniest crack in the shells, for one cracked egg will spoil all other eggs packed in the same receptacle.

Clean, sound earthenware crocks are good containers. Scald them and let them cool completely before use. A crock holding six gallons will accommodate eighteen dozens of eggs and about twenty-two pints of solution. Too large crocks are not desirable, since they increase the liability of breaking some of the eggs and spoiling the entire batch.

It must be remembered that the eggs on the bottom crack first and that those in the bottom of the crocks are the last to be removed for use. Eggs can be put up in smaller crocks and the eggs put in the crock first should be used first in the household.

"Water glass" is known to the chemist as sodium silicate. It can be purchased by the quart from druggists or poultry supply men. It is a pale yellow, odorless, sirupy liquid. It is diluted in the proportion of one part of silicate to nine parts of distilled water, rainwater or other water. In any case, the water should be boiled and then allowed to cool. Half fill the vessel with this solution and place the eggs in it, being careful not to crack them. The eggs can be added a few at a time until the container is filled. Be sure to keep about two inches of water glass above the eggs. Cover the crock and place it in the coolest place available from which the crock will not have to be moved. Inspect the crock from time to time and replace any water that has evaporated with cool boiled water.

When the eggs are to be used, remove them as desired, rinse in clean, cold water and use immediately.

Eggs preserved in water glass can be used for soft boiling or poaching up to November. Before boiling such eggs prick a tiny hole in the large end of the shell with a needle to keep them from cracking. They are satisfactory for frying until about December. From that time until the end of the usual storage period—that is, until March—they can be used for omelettes, scrambled eggs, custards, cakes and general cookery. As the eggs age the white becomes thinner and is harder to beat. The yolk membrane becomes more delicate and it is correspondingly difficult to separate the whites from the yolks. Sometimes the white of the egg is tinged pink after very long keeping in water glass. This is due, probably, to a little iron which is in the sodium silicate, but which apparently does not injure the egg for food purposes.

Limewater is also satisfactory for preserving eggs and is slightly less expensive than water glass. A solution is made by placing two or three pounds of unslaked lime in five gallons of water, which has been boiled and allowed to cool, and allowing the mixture to stand until the lime settles and the liquid is clear. The eggs should be placed in a clean earthenware jar or other suitable vessel and covered to a depth of two inches with the liquid. Remove the eggs as desired, rinse in clean, cold water and use immediately.

Homemade Flytrap.

A cheap but effective flytrap to be set outside of houses and stables may be made in the following manner: Make a circular base about one foot in diameter from a board one-half or one inch thick. With a keyhole or compass saw cut out the main central part of this base, leaving a rim of about two inches in width. Make a top piece with the same outside diameter as the base, leaving it entire. Nail these about two feet apart with four to eight laths or other thin strips of wood, forming a cylindrical frame. Countersink the laths even with the outer edges of both the top and base. This will allow the wire screen to fit snugly around the edges of the top and bottom. Cover the sides of this cylindrical frame with ordinary screen

The cost of this flytrap will not exceed 25 cents and it can be made in an hour's time.

wire. Mosquito netting will do for a temporary trap. Care must be taken to make the edges fly-tight. Then make a cone-shaped inner base of ordinary screen wire to fit the hole cut in the wooden base. A small opening about one-quarter inch in diameter should be left at the top of the cone so that the flies will have easy access to the cage. Tack this wire cone snugly in the hole cut in the wooden base so that it extends up into the cage about eight inches or more. Now fasten from four to eight nails or screws into the bottom board to hold the trap about one-half inch above the surface. This space is sufficient for the entrance of the flies to the bait which is placed underneath the trap.

Use milk, bananas, sugar and vinegar or like materials for bait, and when a considerable number of flies have collected in the trap spray with gasoline or boiling water to destroy them. The trap may be cleaned by removing the inner cone-shaped wire base.

Saves Deep-Cut Potato Eyes.

To the Editor:—I want to give my experience planting potato eyes for the benefit of others. In my home, unless potatoes were very plentiful and cheap we always planted deep eyes in preference to the whole potato. I was much surprised the first time I saw people cutting up whole large potatoes for planting.

When potatoes were scarce or high or if for any reason it seemed best to be saving of them we began early saving the eyes (cut deep) from the finest potatoes when we prepared them for the table. When the regular cutting began the large potatoes were thrown back into the root house after the eyes were taken out, and the wounds dried. We used them for cooking before we used the uncut ones. They do not rot if used soon. I have often begun in February or March to save the eyes. Either dry the surfaces or place them in the cellar with sand sifted over them. In a wet year they come on much ahead of the large cutting, and my experience has been the potatoes do not rot so badly. I put two strong eyes in each hill and have just as fine potatoes as anyone around me.

One thing more I want to mention which has been a help to me. It may be many of the readers already use it, but I will pass it on anyway. To make my yeast I take the potato water when I have been cooking potatoes (about one quart) and add two tablespoonfuls of sugar and let it ferment. If I want to hurry it I add a yeast cake. It takes one or more additions of potato water and sugar to be at its best, but once well started you have such a fine liquid yeast. I simply add the potato water to my starter the day before I bake bread, adding my two tablespoonfuls or more of sugar to each quart of yeast or starter. The next morning it is all bubbly and has foamed up nicely. I set my sponge before breakfast, mix stiff after breakfast and utilize the dinner fire for bread baking. I have no more chilled yeast in winter nor sour in summer. I keep back a cup in a two-quart fruit jar each time, frequently changing to prevent souring. This yeast seems to require less flour in mixing, but we do eat more bread. Mrs. A. D. Hastings.

What Women Can Do.

To the Editor:—Our nation is at war with other nations. We do not know how long this war will continue, nor how many men of our country will be needed before the conflict is ended, but we do know that there will be much food needed by those who are not producing food. The war may reach proportions far beyond present expectations.

There is a scarcity of food, not only in our own country but all the world has come to feel the pressure of the high cost of living. All kinds of foodstuffs are soaring higher and higher.

During the civil war some foods were very expensive, while others were very cheap. This made it possible for one to live cheaply even in those turbulent times. Sugar sold at 25 cents a pound and some of the time coffee could not be bought at any price. But well-browned wheat and rye made a good substitute for coffee, and as sorghum molasses sold at 20 cents a gallon the poor man could have "long sweetening" for his coffee. A fat hen could then be bought at 5 cents per pound, dressed, or 15 cents each alive; this against $1 each for hens now. Eggs sold as low as 3 cents a dozen. Now you are lucky to get them for 3 cents each. Then every farmer raised his own meat and lard in abundance. I knew one family that was in the habit of killing fifteen fat hogs weighing from 300 to 400 pounds each. Think of the price of that man's meat bill now! With a heifer or two and a few sheep at odd times his meat bill alone would be $1,000.

But now, with the shortage of crops and with wheat, corn, oats, rye and potatoes selling at unheard of prices and going higher every day, the thinking men of our nation are advising the farmer to raise all the food products possible.

And here is where the farmer's wife (or any man's wife, for that matter) can do her part. Any woman who has a spot of ground can raise a garden and in so doing be a factor in this war, and gain health in doing it. Raise all the garden truck you can, and can all you raise. Let us put up for next year a sufficient amount for our own families and a surplus for the unfortunate ones who cannot do this.

One authority has said, "Grow a garden this season. Make it produce all the staple foodstuffs possible—potatoes, sweet corn, peas, beans, root crops and all such products as can be canned, dried, preserved or stored to the best advantage." This is excellent advice. Let us act upon it.

There is in my neighborhood, and perhaps in many other places in our broad land, a bountiful supply of wild fruit—thousands of gallons of wild strawberries, raspberries, blackberries, blueberries, gooseberries and plums, that can be canned, preserved or dried for winter use. These health-giving fruits should not be allowed to go to waste in strenuous times like these when the world has need of it.

We well-fed farmers' families can scarcely realize that if in 1917 there should be a shortage of crops we might some of us go hungry. We know, in a detached sort of way, that some of the people in Belgium, for instance, or in India, starve. But in America? Oh, no! we say. And still we know a hen sells for $1, and a pound of flour costs more than 6 cents, and that those who have not the price must go without. What would have been good wages a short time ago only suffices now for the bare necessities of life.

So sisters, let us help along. Let us get out our incubators and raise some of the best meat man ever ate. Let us be up and doing. Let us plant and hoe and garner the harvest. Let us "labor, working with our own hands the thing that is good that we may have to give to him that needeth."

Mrs. Lucy L. Ferguson.

Recipes.

Eggless and Milkless Cookies.—Two cupfuls sugar, one cupful lard, one cupful boiling water, three teaspoonfuls baking soda, one cupful molasses or sirup, two teaspoonfuls ginger, one teaspoonful salt, two tablespoonfuls cocoa. Dissolve soda in boiling water. Use flour enough to roll.—Helen Edenharder.

Easy Cake.—One-half cupful butter, one and one-half cupfuls sugar, four eggs, one-half cupful milk or water, one teaspoonful vanilla, two squares chocolate (melted), five tablespoonfuls boiling water, one and three-fourths cupfuls flour, three tablespoonfuls baking powder. Melt chocolate, add boiling water. Cream butter, add sugar and cream all thoroughly, add yolks and beat hard, then add milk melted chocolate and gradually the flour. Beat vigorously. Fold in stiffly beaten whites of eggs, vanilla and baking powder. Mix quickly and bake in two layers. Put together with caramel or chocolate icing.—M. McFadden.

Gingerbread.—One cupful molasses, one-half cupful boiling water, one and one-third cupfuls fine bread crumbs, two-thirds cupful flour, one teaspoonful baking soda, one and one-half teaspoonfuls ginger, one-half teaspoonful salt, four teaspoonfuls melted lard or other fat. Add water to molasses and combine with the dry ingredients mixed together, then add fat, and beat. Bake about twenty-five minutes in hot oven.

Stew With Dumplings.—Make stew from small pieces of meat and vegetables, cooking it on stove or in fireless cooker. Serve with dumplings made as follows: For a stew using one pound of meat mix a little more than an one-third cup of flour with one teaspoonful of baking powder and a pinch of salt, work in a rounding teaspoonful of butter and mix with enough milk to form a medium stiff dough. Cut into small pieces and cook in a buttered steamer over a kettle of boiling water or remove enough gravy from the stew to expose the meat and vegetables, and place the pieces of dought on these solid materials to cook.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to WISCONSIN FARMER, Madison, Wisconsin.

2086—A dainty dress for mother's girl. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 2⅜ yards of 44-inch material for a 4-year size.

2098—A smart, one-piece model. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3 yards for the guimpe and 5⅝ yards for the dress, of 36-inch material, for a 36-inch size.

2092—A smart, seasonable model. Pattern is cut in 3 sizes: 16, 18 and 20 years. It requires 4 yards for the coat and 3 yards for the skirt, of 36-inch material, for a 16-year size.

2084—A good school dress for mother's girl. Pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires 3¼ yards of 44-inch material for an 8-year size.

in overblouse style. Waist pattern 1826 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 1825 cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It requires 7 yards of 44-inch material to make th entire dress for a medium size. Two separate patterns, 10 cents for each pattern.

1758—Ladies' apron. Pattern is cut in 3 sizes: Small, medium and large. It requires 6¼ yards of 36-inch material for a medium size.

Blouse 1542-Trousers 1543—A comfortable suit. Pattern is cut in 5 sizes: 6, 8, 10, 12 and 14 years. It requires 1¾ yards of 27-inch material for a 12-year size. Two separate patterns, 10 cents for each pattern.

1789—Ladies' negligee or dressing

1664—Ladies' Empire night gown. Pattern is cut in 3 sizes: Small, medium and large. It requires 5½ yards of 36-inch material for a medium size.

2087—A smart coat for the little miss. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 2⅞ yards of 44-inch material for a 4-year size.

Waist 1826-Skirt 1825—A smart dress

sack. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3⅜ yards of 44-inch material for a 36-inch size.

1649—Girls' one-piece dress, with or without added pointed sections, with shield and with sleeve in either of two styles. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. Size 4 years requires 2½ yards of 44-inch material for dress without yoke sections and 3⅛ yards with yoke sections.

2081—Ladies' house dress with sleeve in either of two lengths. Pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6¾ yards of 36-inch material for a 36-inch size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for May 20, 1917.

The Importance of Self-Control—Temperance Lesson.

LESSON TEXT—Isa. 28:1-13.

GOLDEN TEXT—Every man that striveth for the mastery is temperate in all things.—I Cor. 9:25.

Wine in the Scriptures is spoken of under four aspects. First, social, that as illustrated by its use at the marriage in Cana. We must not, however, confuse this wine with the spirituous, strong drink of this present day. Second, medicinal (Prov. 31:6-7; I Tim. 5:23). These passages do not command us to use it as such, and God has very graciously revealed to us in modern medical research the futility of the use of alcohol in the matter of medicine as a remedy. Third, sacrificial wine (Matt. 26:27-29; Luke 22:17-20), and, fourth, wine is spoken about as productive of the woes of men (See Amos 6:1; Heb. 2:15; Prov. 23:20). It is also mentioned by way of contrast (See Eph. 5:18).

The Scriptures speak of drunkards in four different ways: (1) They are to be stoned (Deut. 21:20); (2) Drunkards lead to poverty (Prov. 23:21); (3) Drunkards are to be separated from other men (I Cor. 5:11); (4) they are to be finally separated from God (I Cor. 6:9).

Abstinence from strong drink is enjoined in the Scriptures under three heads: (1) The priest and Nazarite (Num. 6:3; Luke 1:15); (2) the ruler (Prov. 31:4); (3) those who are to worship Jehovah (Lev. 10:3).

This particular lesson is taken from a portion of Isaiah's prophecy where he is anticipating what is about to happen to Samaria, and uttering his warning unto Judah.

I. The Steps of Intemperance. First Disgrace and Dishonor (v. 1). The city of Samaria is compared to a chaplet of flowers on a drunkard's brow, which shall be trodden under foot because of his inebriety. Drunkenness seemed to have been so widespread as to become a national sin. Second, Disease and Degeneracy (v. 2). The pride of beauty spoken of in verse one is to "fall to the earth." This glorious beauty was after all only a "fading flower" (I Pet. 1:24). The coming of the Assyrians upon Samaria is described in a three-fold way: (1) As a "tempest of hail;" (2) as a "destroying storm;" (3) as a "tempest of mighty waters overflowing." The thought contained is that of widespread and overwhelming destruction. Back of this work of devastation and destruction and desolation was the wrath of God against sin (Ch. 2:4-9). All earthly pride shall be trod under foot. Samaria, "a fading flower," was to be greedily eaten up by the oncoming enemy.

II. Those Reached by Intemperance. Strong drink causes men to err in their conduct, in their moral insight, in their judgments. It reaches the beautiful (v. 1); it reaches the learned (v. 7); it reaches those in authority; in fact all classes. It leads men to the depths of degradation and to the loss of their wills (v. 8). It makes men to become beasts, wallowing in their own vomit. Not only Samaria, but "these also" (vv. 7 and 8), that is people of Jerusalem have erred through wine and strong drink. Even the priests and the prophets had and do so now (See Ch. 56:10-12; Micah 2:11). The priests were especially inexcusable because of the plain directness of God's word (Lev. 10:9-10; Ezekiel 44:21). The result of their intemperance was that they utterly failed in their official acts. They reeled in vision and stumbled in judgment. The use of wine and strong drink made their social gatherings filthy and disgusting. Temperance is the habit of abstaining from everything that destroys. It is the control and right use of God's good gifts for service. Intemperance is lack of control or the wrong use of God's gifts in self-indulgence.

III. The Lesson in Contrast. Jerusalem vs. Samaria. Samaria's crown of pride was not the glory of God. Its beauty was a fading flower (v. 4), his wisdom contemned through the ignorance of Samaria (vv. 6, 7, 12), his strength versus their weakness and wickedness (vv. 6, 13). God teaches by contrast as well as by direct precept. Verses nine and ten may be taken as a mocking answer of the people to God's prophet. Isaiah intimates that the time to begin our instruction is in childhood (v. 9), that precept must be upon precept, and line upon line, here a little and there a little. There never is a time when we can let up in this struggle against the mighty evil of intemperance.

Take as a reply (v 9) this would seem to indicate that God took them to be babies just weaned. If the prophet himself, is the speaker, then Jehovah is represented as teaching knowledge to babes and not to the self-efficient. It is these whom he "makes to understand his message" (R. V.), and the method of his teaching is precept upon precept. If we will not hear God's loving and patient call to repentance, he will speak to us through cruel enemies. If we will not teach our children, if we will not keep everlastingly agitating this question, he will use other means (v. 11).

WANTED A Man To Travel For A Profitable Business
YOUNG MAN—21 years or over, with some farming experience preferred. To take charge of a profitable retail business in your county. Good reference required. If interested, samples on request.
A Rare Opportunity
You owe it to yourself to investigate.

$10 for a Name for this Picture
This little girl is calling to her Daddy who is just starting out in his new Saxon Roadster.
What Does She Say?
To the person sending the best answer that can be used as a name for this picture, I will give a prize of $10.00 in gold. Get busy and write me what you think she says. You can win the $10.00 prize if you try.
Saxon Car Given Away
A new auto contest is just starting. At the close of the contest a $395 Saxon Roadster will be given to the winner. In case of a tie a Saxon car will be given to each person so tied. Send at once and you can be entered in this great contest. Full particulars by return mail.
Saxon Editor, 800 Popular Bldg., Des Moines, Ia.

The restriction in England of the output of beer to 10,000,000 barrels will make a great difference in the appearance of the Kent hop fields this year. The hops required for 10,000,000 barrels can be grown on about half the land given up to hops last year. Many growers are using their hop fields for food crops.

Don't Harness Your Rupture

Send For This Appliance ON TRIAL

WHEN you put on a truss you put on a most uncomfortable harness of leather and steel. Often it is ill-fitting, always it is an inconvenience in bed. Few of them are unaffected by water.

The **Brooks Rupture Appliance** has none of the faults of a truss. Being made to your order, it fits perfectly. Resting flat and smooth, it is inconspicuous. And its soft cushion adheres to the flesh, making slipping impossible. Air continually circulates through this cushion.

Endorsed by Physicians

Leading physicians everywhere endorse the **Brooks Rupture Appliance.** Between six and seven thousand voluntary testimonials in our files bespeak the comfort and relief afforded to rupture sufferers by this remarkable device.

The **Brooks Rupture Appliance** is sent on free trial to prove its worth. It is sold on a basis of satisfaction guaranteed or money refunded. Since we are a sanitarium, not a factory, special care and thought are given to your particular case. **Don't suffer longer with rupture.** Write today for further information about the Appliance which has given relief to thousands when all other methods failed.

Use the coupon. Use it now.

BROOKS APPLIANCE CO.
Manufacturers of Orthopedical Appliances
480 State St., Marshall, Mich., U. S. A.

I should like to receive, in a plain wrapper and without obligating myself in any way, full details concerning the **Brooks Rupture Appliance.**

This Horse Nail Head

Sits right down into the crease of the shoe. Experts say "the set of Capewell nail head is faultless." Hoof, shoe and nail head become as one.

No chance for nails to chafe, to wear thin at the head and break, when your shoes uses The Capewell brand. The world's best nail at a fair price. Quality considered—the cheapest.

THIS CHECKED HEAD OUR TRADE MARK

When writing to advertisers kindly mention The Wisconsin Farmer.

Making Agriculture Interesting.

(Continued from page 1.)

and necessarily simple enough in pattern to make this a possibility for all.

In the primary department where the tots learn their first lessons Miss Anna Schroeder has charge. The usual primary courses call for much work. Miss Schroeder has a way about her that makes the hours seem short for restless youngsters and she manages to add a few features. On Friday afternoon Miss Schroeder has the third, fourth and fifth grades in construction work. Raffia and clay construction form chief subjects. The work in this branch is as carefully planned and carried out as in the other courses.

It is no wonder, therefore, that truants are scarce in Sussex and instead of dreading the school work the children enjoy it. They like their teachers for the simple reason that the teachers, out of love for doing a thing well, have worked faithfully in preparing the work and the children realize this. They feel that the teachers have their interests at heart all of the time.

READING CLUB OUT ON AN EXCURSION.

Wisconsin Fair Dates.

The Wisconsin State Fair will be held at Milwaukee, September 10th-15th. O. E. Remey, West Allis, Wisconsin, is secretary. Other fairs in Wisconsin, the name of the secretary and the 1917 dates, follow:

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

Ailing Animals.

Joint Ill.

One of our spring calves is very stiff in his legs. The joints of the front and hind legs seem to be swollen. He can hardly walk or get up.

We would suspect that your calf is a victim of joint ill and, if so, very little can be accomplished by treatment.

Head Sores on Pigs.

We have a few little spring pigs which have weak places on their scalps. Some are as big as a dime and they are red and soft. There seems to be a growth of some kind on them. These pigs are all from young sows.

We are inclined to believe the sore spots come from injury from some source and that the flesh, being irritated, rather pushes up above the wound margin. Wash clean all sores and apply tincture of iodine to the spots every other day for three or four times.

Enlargement on Carpal Joint.

I would like your advice regarding by five-year-old horse. He has had a little ball on his front knee for a year, but it did not grow larger until this spring. Now the ball is the size of a baseball and he is a little lame. He did not work until this spring.

You do not state whether this enlargement is hard or soft; therefore, it is hard to prescribe treatment. However, in either case it would be well to give the parts a stiff blistering while the animal remains idle. The blistering can be repeateed if need be.

Failure to Breed.

I have a Holstein cow (a very valuable animal) that came fresh last October. She cleaned well and seems all right except that she passes quantities of water often and has not come in heat. I have taken her to a veterinarian, but he did not seem to help her at all.

Just why your cow does not breed can only be determined by first having all history connected with the case and also by making an examination of her. There is probably some unnatural condition present in the generative system. Perhaps when grass comes and abundant exercise is furnished the trouble may be overcome.

Bloody Milk.

I have a Guernsey heifer that gives bloody milk. This is her first calf. She came fresh last October and the milk has been bloody all the time.

It is very doubtful if this cow can be helped any because of the long standing of the case. The trouble might come from injury to udder, from acrid foods, or might even come from deposits of tubercles or tumors in the udder. The irritation caused by milking contributes to draw the blood. If the food is too rich or abundant it must be reduced. If the trouble comes from acrid plants they must be removed from food such as hay; if from tubercle or tumors within the udder this cannot be overcome.

Lameness.

I have a four-year-old gelding, weight 1,150 pounds, that went lame on the left front foot about a week ago. He has his winter shoes on, so thinking they were hurting him, we removed them, but he got worse. We called the local veterinarian, but he failed to tell just what was the trouble. He dug around in the foot and the only thing he thought out of the ordinary was that the small end of the frog was reddish. He placed a blistered poultice on him. He is not quite as lame as he was, but is not right. Do you think we should place a shoe on him again?

With your few given symptoms it would be impossible to make a positive diagnosis. If the animal does not improve soon, would advise another examination by a competent man. There may be slight strain of some of the tendons, or there may be some shoulder lameness. These points should not be overlooked. If there should be a pus cavity within the wall of the foot, the lameness would not begin to subside till the puss cavity is freely opened. There may be some injury to the frog and heel, but rest may overcome most of the above lameness.

Warmer Weather Is Needed.

Pastures and Clover Growing Slowly—Too Cool for Corn Planting —Small Grain About Normal—Average Number of Live Stock.

WISCONSIN.

Bayfield County.—Weather is cold and backward. Oats and spring wheat seeding is in progress and there will be more spring wheat and oats this year than last. No potatoes have been planted yet, but prospects are for a larger acreage of this crop than usual. A big acreage of silage corn will be planted. Fruit trees were not injured by the cold weather. Strawberries are slow, but warm weather will bring them out. Stock wintered well, but there is no grass yet to speak of. We need warm rains.—E. C. Stevens.

Burnett County.—Seeding is done and it is two or three weeks earlier than last year. Frosts have been frequent and the weather is not good for crops. However, the grain is ready to peep out of the ground. Cattle are having a hard time, as the grass is growing very slowly. Farmers are out of hay and feed is "war priced." No diseases have been reported among cattle. Winter wheat is very poor. About the same acreage will be put in corn and potatoes this year as last. Rain has not been plentiful.—Fred Larson.

Chippewa County.—Spring work is late on account of cold weather. Pastures and grain are growing very slowly. Corn and potatoes will be planted about the middle of the month. Fruit trees will be later in blossoming this season than usual. The acreage of corn and grain will be increased above normal. Live stock are about normal in numbers. Cases of abortion have been reported in some herds of cattle.—Gustave E. Rheingans.

Clark County.—Farm work is about three weeks late because of the cold, wet weather. Winter grains and meadows are at a standstill. If the weather should warm up clover will be a good crop. The early sown small grain is coming up, but looks thin at this time. No planting of gardens has been done to speak of. Live stock are out on pastures.—F. W. Ackerman.

Douglas County.—More spring wheat is being sown this year than usual and the oat and barley crops will be extra large. Cattle wintered well, but April was a hard month for dairymen, as feed was very scarce and high priced. Pastures are smaller than usual.—J. Otten.

Grant County.—The small grain has been put in in good shape, but the weather is too cold for it to grow. All vegetation is growing very slowly. Live stock are in good health. Young pigs are not very plentiful. No corn has been planted in this locality so far.—P. R. Stoeffel.

Iron County.—Spring is backward and the frost is just about out of the ground. Seeding has been delayed. A considerable acreage of garden truck will be planted this year. All live stock are in good health.—Henry Peterson.

Kewaunee County.—Along the lake shore late seeding has been finished, but farther west it is about half done. Meadows and pastures look well, but are backward. Alfalfa wintered well. Live stock, including cattle are in good condition and more grain has been fed to them even at high prices. There are two cow-testing associations in this county and the prospects are good for another one. More heifer calves will be raised this year than usual. A normal acreage will be put in small grains. Several carloads of tile drains will be laid this summer. Seed potatoes are very scarce.—W. C. Katel.

Monroe County.—Clover, alfalfa, and winter grains wintered well and are doing fine. Oats are coming along fine and some spring wheat has been planted. Some farmers had to reseed oats on account of the heavy rain of April 18th. Corn planting will begin very soon if the weather stays warm. Live stock are in good condition considering the scarcity of feed. A few farmers have sold some of their cows on account of high prices and this may cut down the supply of cream until the young heifers begin producing. Our creamery pays 45 cents to 50 cents for cream. Poultry is profitable at this time. One farmer here got sixty chicks from four hens.—B. F. J.

Oconto County.—Ground is getting in good shape. There will be a large acreage of grain this year, also a large area of potatoes and corn. Cattle are in good shape, but there are no pastures yet. There is an average number of live stock on farms this year. Many farmers are wanting to buy good milk cows. —J. Hinker.

Outagamie County.—The first seeding of clover is very promising—about 95 per cent normal. Alfalfa also is about 95 per cent normal. Clovers on old meadows were hurt by frost, so that they are only about 75 per cent normal. Rye is very good. Winter wheat prospects are not good. Not many farmers put in spring wheat this year. Oat seeding is finished. A good deal of live stock have been shipped out. All stock is rather thin. There has been some trouble with scours in young calves.—Harry Lepplu.

Outagamie County.—Early seeding on cold, heavy soil has rotted to some extent and will be resown. The prospects are still favorable, however, for good crops. Corn planting will be a little late There is no pasturage yet to speak of and feed is now exhausted. A few warm days would change things considerably. Live stock are in good condition, but some are quite thin. Apple trees need pruning and spraying at this time. Pigs are scarce and sell at from $5 to $10 each. Farmers are trying to raise large crops of wheat, corn and potatoes. Seed wheat is worth $3.25 a bushel and potatoes from $4 to $5.—Peter Tubbs.

Oneida County.—Practically all of the wheat is sown and considerable oats and peas. Some of last year's seeding of clover winterkilled.—A. Blumenstein.

Ozaukee County.—Much clover winterkilled and winter wheat and rye suffered as a result of the severe winter and cold, backward spring. More spring wheat was sown this year than for many years past. The acreage of all small grain is unusually large and more land will be planted to corn than has been the custom. Corn and small grain together will show about 15 per cent increase in acreage. There is danger of short pasture, as some farmers are tempted by the high price of grain to use grass land for grain crops. Because of the high price of feed there is a tendncy to reduce the number of calves. Fewer mares will be bred than usual, because horses have not advanced in price relative to other classes of live stock. Many farmers are using tractors. There is no grass yet. Small pigs are scarce and the demand is great. The number of pure-bred bulls is increasing.—C. F. Dineen.

Marinette County.—Season is backward, but better than last year. Most of the oats are planted and some peas have been put in. Few potatoes are left in this section and the acreage of this crop will be smaller than last year. Farmers are pushing their work as much as possible. Good milk cows are worth from $85 upward. There are about the usual number of calves in the county. Hogs are scarce and pigs very high priced. Meadows are looking fine, but pastures seem to grow slowly.—W. B. Sanderson.

Pierce County.—Oat seeding has been delayed a little on account of rain and snow. Soil is in fine shape. Considerable spring wheat was sown, but there was not enough seed to supply the demand. About half the rye winterkilled. The usual acreage of potatoes will be planted. The corn acreage will be increased about 10 per cent. Clover came through the winter in fine shape. Hay is scarce and selling for $12 a ton in the barn. Pastures are starting, but warmer weather is needed.—T. B. Eaton.

Racine County.—Because of cold weather crops are backward. Grain is up, but making no growth. Hay and pasture have made very little growth. Live stock in general are in good condition. On account of the high price of veal young stock is being sold off. The acreage of grain this year is somewhat greater than usual. Many farmers are sowing enough wheat to supply flour for their own use.—Chas. Jeffery.

Sauk County.—Weather continues cool and fair. Oats are all in and much of the plowing for corn is done. Pastures are very short on account of the cold. The acreage of oats and corn will be about normal, there will be a slightly increased acreage of potatoes. Young cattle are not in as good condition as usual at this time of year because feed is scarce and high priced. A good number of pigs will be raised this year.—A. H. Buehler.

Shawano County.—Clover, alfalfa, winter wheat and rye came through the winter in fine shape. The recent clover seeding looks fine. The winter was hard and long and feed high priced; young stock are not in as good condition as a year ago. Because of wet weather for the last two weeks, low land has been difficult to work. Much corn for silage, as well as ear corn, will be planted. Farmers are selecting the cheapest new land and turned under clover land for potatoes. Few potatoes will be planted on poorer land because of the high price of seed. Beans and root crops will be planted extensively. An effort will be made to get crops for the canning factories.—M. J. Wallrich.

Taylor County.—Live stock wintered well. The season is late. Seeding has commenced and warmer weather has encouraged the farmer. There is a good deal of oats and summer rye in this section. Corn will soon be put in. Potatoes are scarce and worth $2.50 a bushel, but a considerable acreage will be planted. Grass and meadows are growing, but the hay crop will be late. Farmers and city people will make big gardens this year.—E. H. Dehne.

Trempealeau County.—Winter grain in this section looks fine, but cold nights are keeping the pastures back. However, they will soon be fit to turn cattle on. Fruit will probably be good this year. A large acreage of potatoes is being planted and considerable truck gardening will be done both in the country and on vacant lots in villages. The corn acreage is good and considerable silage will be made this year. Planting will not begin for about a week. Hay and small fruit are doing well because of the plentiful moisture. —C. G. Kremes.

Walworth County.—Weather is very cold and backward. Small grain is coming up slowly. Clover winterkilled badly. There are no pastures yet. Sheep have been turned out, but the cattle are still being fed. The lamb crop is good, but some farmers have had bad luck with young pigs.—Arthur Ewing.

Washburn County.—Grass has started to grow. Hay is scarce. Oats are practically all sown. Many small patches of spring wheat were sown. Weather is cold and dry with much east and northeast wind. About the usual acreage will be put in potatoes; and there is just enough seed on hand. Labor is very scarce.—John W. McCulloch.

MINNESOTA.

Mower County.—Season is cold and backward although most of the farmers have put in their small grain. Live stock are in good condition, but scarce. Few hogs are being fattened. The young pig crop is better than average. Farmers expect to plant more potatoes than usual. Clover and alfalfa look well. There is no pasture yet for cattle. Hay is selling for $15 a ton. In some cases lawns are being plowed up to make more garden.—Walter H. Martin.

War means more acres tilled -at less cost per acre

The nation is turning to the farm business man.

During the months that are to come, *he* is the one who must solve the problem of bigger and better crops, more intensive and extensive farming, *at less cost per acre.* It is these problems which the

TRACFORD "The Tractor Universal" **$125 F.O.B. DETROIT**

will help to solve to the greatest profit and satisfaction of the man on the average American farm—the man who wants power farming at less than big-tractor expense.

The TRACFORD attachment is converting thousands of farm -owned Fords into *light tractors* with a draw bar pull of 1000 pounds on high gear.

Ample in power—economical in operation as the Ford car itself—able to plow throughout the entire day on high gear—capable of doing any work formerly handled by three good horses—the TRACFORD is one of the most instantly available means of turning the Ford on the Farm into a highly useful and profitable piece of agricultural equipment—a quickly adaptable power unit for either work or pleasure use.

Let us put you in touch at once with the TRACFORD dealer in your district. Then ask him to *prove* to you the wonderful possibilities of this tractor unit on YOUR farm.

"The Tracford Catechism" answers every question you may want to ask. Send for it.

Get Ahead of the Weather

THIS cheaper, better, quicker way of getting in the hay goes into effect on your farm the day you begin to use **International, Keystone,** or **Osborne** hay tools. Hay is properly air dried and cured, and no leaves or blossoms are threshed off by either side-delivery rakes or loaders. The speedy but gentle handling of the hay often saves the crop.

Our side-delivery rakes, built almost entirely of steel, all have left-hand delivery. They follow the mower closely, throwing up the windrow on clean raked stubble. The three bar cylinder can be adjusted at each end for height and the points of the 12-inch teeth can be moved forward or back.

The loaders, of both cylinder and rake types, rake the field clean and elevate the hay to a point where a big load can be put on the wagon. They handle the hay with a gentle, hand pitching movement that makes them especially good for clover or alfalfa.

Look carefully over the rakes, tedders, loaders, sweep rakes, stackers and combined sweep rakes and stackers in these three good **International Harvester** lines. Write us for catalogues now so that you can begin to get acquainted with their many good features.

The Waukesha Holstein-Friesian Sale.

ON pages 12 and 13 of this issue will be found the advertisement of the Waukesha County Holstein-Friesian Breeders' Association announcing the next sale, which will be held at Waukesha on May 31st and June 1st. This will be the biggest sale of high-record animals that the association has ever held. It will include the complete dispersion of two of the best herds in Waukesha county and the drafts made from other herds include only animals of the very best breeding. Fred Pabst, of Oconomowoc, puts in a son of the $12,000 bull, Korndyke Segis Johanna, while Connell Bros., of Colgate, will put in six of the best from their herd, one of them a daughter of a 27-pound cow. The consignment of Dr. David Roberts, of Waukesha, consists of Queen Schillaard, a cow with a seven-day butter record of 27.28 pounds, and the other a son of this great cow. The Mielenz Dairy & Produce Company, of Pewaukee, will put in two cows having records of 18 and 20 pounds respectively. S. S. Cramer, of Hartland, will put in five good ones and J. D. Howell, of Waukesha, has entered three head. S. Baird & Son, of Waukesha, have entered a well-grown young cow out of a dam with a record of 27.35 pounds and also a 23-pound three-year-old cow. H. H. Earle, of Eagle, will disperse his entire herd of 27 head, including 12 cows and heifers with records from 12 to 23 pounds. John J. Reid & Son, of Oconomowoc, will enter three head, and Geo. Carroll, of Waukesha, two head. Mr. S. B. Lowry and Schley Bros., of Waukesha, have entered four head, while Dreyer Bros., Dousman, are putting in three animals, one being a yearling daughter of a 31-pound bull. Baird Bros., of Waukesha, are listing eight head, seven two-year-old heifers by a 31-pound bull. M. W. Downing & Brother will disperse their entire herd of 50 head, including their five-year-old show bull, Downing Pontiac Butterman. The dam of this bull will also be included in this offering, her record being 35.37 pounds, while her sister, with a record of 29.55 pounds will also be in this sale. The Downing entries will include eight sons of Downing Pontiac Butterman. They are nicely grown, well marked, and of splendid individuality. Catalogs for this great Holstein offering are now ready for distribution and may be obtained by writing Waukesha County Holstein-Friesian Association, Waukesha, Wis Please mention The Wisconsin Farmer when you write.—Adv.

The Martiny Durocs.

IN view of the fact that Riley Martiny & Son, Baraboo, Wis., bought some of the best Duroc Jersey sows in Wisconsin last winter, breeders throughout the state are no doubt interested in their outcome. We recently spent the day at the beautiful High Banks Farm, on the banks of the Wisconsin river, and the Martinys have a fine lot of Duroc porkers. The four sows purchased in the Atwater sale and the top sow of the Madison sale, five in all, are raising 40 thrifty, healthy pigs. All of these sows contain the blood of that good sire, Marion's Wonder, and the pigs are sired by Proud's Chief Jr., P. S. Wonder and Illustrator King. At the present time those by P. S. Wonder are the best pigs. The Minnesota sow sired by Chief Invincible with the litter by the champion, Royal King, is doing very nicely and with proper care some future herd boars should come from this litter. The balance of the pigs are by Martiny's Crimson, a son of Lee's Defender, out of a Golden Model 2d dam. There is one good litter by Royal King 2d, he by a son of the noted Royal King out of a Volunteer dam. In all eight sows are raising 62 pigs. Pierce and the slop pail are good "pals" and the pigs are as far along as any we have seen this spring. They expect to have a show herd out this fall and they certainly have a nice lot of material to pick from. At this time they have for sale a real fine yearling sow bred to Royal King 2d for a June litter. They will sell spring boars to any one interested in the good kind. The "tail-enders" will not be sold for breeders. Keep this firm in mind, for you Duroc men will have to figure that they are in the game in the future. Note the advertisement on page 22.—Adv.

Waukesha County Guernsey Sale.

THE tenth annual consignment sale of the Waukesha County Guernsey Breeders' Association will be held at Waukesha, June 7th. Sixty pure-bred males and females will be offered. On the day preceding the sale the annual summer meeting of the Western Guernsey Breeders' Association, and the Waukesha County Guernsey Breeders' Association, will be held at the Geo. McKerrow farm, Pewaukee. Here are two important events where pleasure and business may be combined in a most profitable way. Write to F. E. Fox, secretary, Waukesha, Wis., for a copy of the catalog of the big sale. Successful dairying depends on the cow and it will pay any dairyman to look over the offering at Waukesha June 7th. When writing for catalog please mention The Wisconsin Farmer. See advertisement on page 21.—Adv.

Buys New Herd Boar.

WE have just had a letter from M. H. O'Keefe & Son, Waunakee, Wis., advising that they have just purchased a September 4, 1916, Duroc Jersey boar to head their herd. This boar, named Giant Algo, is sired by Col. Algo, he a son of the noted King the Col. Col. Algo recently sold for $750 and he was one of the best boars in Iowa. Algo's Giant, the junior champion at Omaha last fall, is by Col. Algo, so the O'Keefe boar is a half brother to the junior champion. We hope Messrs. O'Keefe have the best of success with him.—Adv.

How Sam Jones Made Good, Careful Watching Overcome Poor Stock.

WHEN young Sam Jones moved to Center Point and bought out an old white farm that had been rented by diffrent ones for the last five years and given up as a failure, everyone said that it would not be long before he, too, did the same. They could not see how this young man, with very little practical knowledge, could succeed where some of the oldest farmers there had failed. They did not know, however, that Sam Jones intended to run his farm on a different basis than it had ever been run before. The first thing he did was to clean up all the barns and yards and put everything in the best condition possible. Then he went around to the different farmers and bought up a number of hogs and cattle. They were nearly all runts and scrubs, but with the ones already on the farm, they made a good showing in quantity but little in quality. Again all the neighbors shook their heads and said it was a shame to see another man fail, but they did not know Sam Jones. With the first feed, he gave Dr. Hess stock tonic to all alike, for he knew that almost all of them had worms and that it was necessary first to get rid of them and then build up their system. Very soon the neighbors noted the difference in the stock. They were all taking on fat and were better looking every way. A little later he shipped the whole lot to market and obtained the highest prices and his stock weighed as much as any other. When asked how he made such a success, he attributed it to careful watching and feeding Dr. Hess stock tonic. This preparation, he claims, is the only one he would use, for it has always done as claimed and is sold with a guarantee to do all claimed or your money back.—Adv.

Meinking Offering Good Gilts.

WE recently called on R. Meinking, Bangor, Wis., who has one of the oldest Poland China herds in the state. When we were there he had 104 pigs with four more sows to farrow, this was an average of about eight pigs to the litter and his pigs are certainly doing fine. They are sired by Wonder 274611, Double Hadley 4th 256019, Big Price Again 268817 and Select Major 239039. Mr. Meinking has about a dozen very nice fall gilts for sale that he is breeding to Double Hadley 4th for fall litters. These gilts are well grown and in nice condition and he is pricing them well worth the money. The dam of some of these gilts was out of a Big Joe-A Wonder bred sow, the best sow in the Meinking herd. He also has an outstanding boar, litter mate to some of the above gilts. He will weigh about 275 pounds and was farrowed September 2d. A good buy for someone. The spring pigs will be ready to ship about June 10th and if you are going to buy a spring pig of this breeder order early, for he sells many at this age. Investigate the bred gilts at once—they'll cost a great deal more this fall. See page 22.—Adv.

A Baby Herd From Crandall.

HARRY T. CRANDALL, Cass City, Mich., had 100 sows that farrowed in March and April and he is now ready to "do business" with anyone wanting Chester White spring pigs. His pigs are sired by several noted boars, in fact Mr. Crandall has six herd boars of his own, each one a first-prize winner and champion at some state fair. This is a feature not found in any other Chester White herd. He is featuring, at this time, "baby herds" consisting of two spring gilts and a boar not related. Here is an opportunity to get into the pure-bred game without a great outlay of cash, yet you can get in with the very best breeding and good individuals. Mr. Crandall will ship you good pigs, in fact he will ship on approval and he would not do this if he thought his pigs would not give satisfaction. He also furnishes pedigrees with his pigs made out in your name. Write at once for his catalog descriptive of the stock produced on this farm, look this over carefully and send your order so as to get the pick. Please mention The Wisconsin Farmer.—Adv.

Sales to Minnesota.

WE have just been advised by Dennis Shea, Melvina, Wis., that he sold 15 fall gilts to Mr. Farrar, of Minnesota. It will be remembered that Mr. Farrar was one of three men that paid $410 for Defender Queen in Atwater's sow sale. Mr. Farrar also purchased Model King, that good breeding boar that has been used in the Atwater herd, and a half interest in one of the Orion Cherry King boars of Mr. Atwater. Mr. Shea reports over 160 spring pigs "all doing nicely." Remember that he has some very fine fall boars for sale.—Adv.

"Long, Strong Back and Heavy Bone."

THE above is the expression commonly used by H. A. Derenthal, Wykoff, Minn., when you ask him what kind of a Chester White he likes. He has them with the above qualifications too, and just at this time he has some very fine fall boars that are "long and have strong backs and heavy bone." Of course they are well bred, for Hank knows the breeding that is in demand and he does not let his herd get "stale." We are glad to recommend this herd, for he has the goods. Please mention The Wisconsin Farmer.—Adv.

Dispersal of Linscott Jerseys, May 31st.

ANNOUNCEMENT of the dispersal of the register of merit herd of Jerseys of R. J. Linscott, Holton, Kan., is attracting the attention of dairy cattle breeders of all sections of the country, as evidenced by inquiries for the catalog. This sale, to be held May 31st, comprises 125 head of registered Jerseys, including 60 heavy milking cows, 45 heifers and 20 bulls. The offering includes imported cows, prize winners and cows with high official tests. The herd bulls, Jacoba Irene's Premier and Gamboa's Knight, are in the sale. The Linscott herd is the oldest and the first register of merit herd in the state. The herd has been bred up to a high standard by the use of such sires as Jacoba Irene's Premier, imported Oakland's Sultan, Golden Fern's Lad and other great bulls. The catalog reveals the herd is bred for heavy production of milk and butter as well as for type and the entire herd is in fine condition and comprises the greatest offering of Jerseys ever made in this section of the West. Write for the catalog, mentioning this paper.—Adv.

Makes Good Sales.

WE have just received the following letter from McKevitt Bros., Bloomington, Wis., breeders of high-class registered Aberdeen Angus cattle. "We are sending you a list of our bull sales recently made. It has been our best year to sell cattle. As usual we get our best results from The Wisconsin Farmer." They sold the following young bulls: A double Pride to F. M. Meinecke & Son, Forest City, Iowa; Arthur Ariss, Bagley, Wis., a Pride; Thos. Harris, Bagley, Wis.; T. A. Grimsey, Bagley, Wis., an extra good Erica; Matt. J. Zenz, Lancaster, Wis., an Erica; John Zenz, Bloomington, Wis., Arthur and John Fagan, Bridgeport, Wis., an Erica; John McKevitt, Patch Grove, Wis., a double Pride; E. L. Yager, Bloomington, Wis. The McKevitt Bros. have the goods and don't forget them when in need of Angus cattle. We will have more to say about their Durocs later. They have a herd of hogs that will class with the best.—Adv.

"King Orion."

NO boar that we have seen in the state has made the growth since last fall, that King Orion has. With all due respect to other good boars in the state that we have seen, King Orion is the best boar at the present time that we know of. He is owned by E. H. Parker & Son, Janesville. They also have a yearling by The Principal 4th, that is doing well and is a good individual.—Adv.

It Pays.

WE have just received the following from Riley Martiny & Son, Baraboo, Wis. "Please change our advertisement, for we have sold all the Guernsey bulls we care to for the present and it has all been through The Wisconsin Farmer. Thank you for the good work." You furnish good stock and The Wisconsin Farmer will get you the buyers.—Adv.

ALEC S. KNUDSON, Brodhead, Wis., has a very nice lot of Duroc pigs, most of which are of April farrow. Most of them are sired by a Taxpayer-Joe Orion 2d bred boar and he has no reason to complain about this boar as a sire. There are about 80 pigs on the farm from ten sows. He has one litter by King Defender. Knudson has been improving his Guernsey herd, with age, and he now has a herd that will compare with most any of them. Frank Rilma, a son of the noted May Rilma, heads the herd.—Adv.

W. C. SCHIEBE, Burlington, Wis., Chester White breeder and owner of Perfect Prince, one of the best boars in the state, has 60 some pigs from nine sows. Perfect Prince has done well since the fairs lase fall and at the present time looks like a contender for the blue this fall. The pigs by him are the best on the farm and will have a nice bunch to offer his trade this fall.—Adv.

COOK BROS., Burlington, Wis., have just purchased an outstanding yearling boar to head their herd of Chester White sows. He is a son of old Chief Keokuk and is a real boar in every respect. If he continues to do well they expect to show him at the fairs this fall and you breeders that have junior yearlings had better start to feed.—Adv.

J. D. GANT, Delavan, Wis., has some 75 pigs by several different boars. He has a good litter by King Orion, one litter by the champion, King Defender, and a nice litter out of his $290 Pal's Col. sow. This litter is by the Omaha champion, Orion Cherry King Jr. Others are by his Illustrator and Cherry Chief boars.—Adv.

A. E. PURDY, Orfordville, Wis., has about 50 Poland China pigs. Mr. Purdy is a good caretaker and he is with his pigs most of the time and he sure has them doing fine. He is now using a son of Percy Young's Orange Wonder in his herd and he sure has the size combined with quality.—Adv.

WM. F. BUTTS, Evansville, Wis., has about 40 Chester White pigs and they compare with any we have seen of the breed. Most of them are by his good boar, Pay Streak. Remember Mr. Butts has a fall boar sired by Izzy O. K. Wonder that looks like a comer. He will be shown this fall.—Adv.

W. G. BARTHOLF & SON, Burlington, Wis., have 50 Duroc pigs, and they are as good as any we have seen. They were farrowed in March and the owners were fortunate in saving most of the litters. They also have a nice bunch of fall boars and gilts.—Adv.

W. W. VAUGHN & SON, Burlington, Wis., have their usual assortment of Durocs, Chesters and Hampshires. They only kept a few Durocs, but they have a nice lot of Hampshire and Chester White pigs.—Adv.

SALE DATES.

Guernsey Cattle.

June 7, Waukesha County Pure-Bred Guernsey Breeders' Assn. sale, at Waukesha, Wis.

Jersey Cattle.

May 31, J. R. Linscott, Holton, Kan.

Holstein Cattle.

May 31-June 1, Waukesha County Holstein-Friesian Breeders' Association Sale, Waukesha, Wis.

Hereford Cattle.

May 18, Birch & Thompson, Lake Geneva, Wis.

Lake Mills Holstein Sale.

The fifteenth semiannual consignment sale May 8th and 9th was well attended and the bidding was generally good even though there were few sensatonal prices. Lilith King of Rock, a 29-pound son of King Segis Pontiac, consigned by John Hetts, topped the sale at $1,500 and was purchased by Emmons Blaine. It is seldom that as good an individual is led into a sale ring as Lilith King of Rock. When his individuality, breeding, especially on his sire's side, and the high producing qualities of his maternal ancestors are taken into consideration he measures up well to the requirements of an ideal herd sire. There were not as many high-class aged cows as one likes to see at a two days' sale, but on the other hand there were some exceptional yearling and two-year-old heifers consigned. Fred Gurr and John Jones had some of the choicest of these heifers in their consignments. Henry Anthes, Geo. Stroebel and Henry Schimming likewise had some especially well-bred heifers consigned. A two-year-old heifer consigned by Geo. Stroebel brought $360. Canary Fobes Jessie De Kol, consigned by Wm. Everson & Sons, was one of the choicest females of the sale and went to F. W. Rogers, Beaver Dam, Wis., for $500. The following is a list of sales:

Juliana De Kol Lake Side, May 25, 1916; John D. Hetts, Ft. Atkinson, Wis. $500
Hendrika Juliana Walker, Oct. 8, 1916; F. G. Behmke, Arkansaw, Wis. 170
Johanna Juliana Repeater, Oct. 2, 1916; Harold Baker, Renville, Minn. 100
Juliana Segis Johanna, Sept. 28, 1916; John D. Hetts 110
Johanna Pontiac Champion, Aug. 15, 1916; Geo. H. Elwell, Minneapolis, Minn. 165
Juliana Lake Side Johanna, Sept. 2, 1916; Morton Friend, Orland, Ind. 255
Lady Gem Repeater of Rock, July 13, 1916; T. C. Behnke, Arkansaw, Wis. 185
King Juliana De Kol Portia, Nov. 9, 1916; Fred Leonard & Sons, Jefferson, Wis. 85
Colantha Blossom Pontiac, Mar. 8, 1916; Wm. Everson & Sons, Lake Mills, Wis. 305
Belle Longfield 2d, April 17, 1913; R. E. Church, Elkhorn, Wis. 305
Piebe Pride Vale, Nov. 3, 1912; R. C. Church, Elkhorn, Wis. 350
Piebe Pauline Madrigal 2d, Dec. 31, 1910; Lee Bros. & Cook, Harveyville, Kan. 115

Commercial Fertilizers.

To the Editor:—The abnormal price of all food supplies and the great importance of increasing the yields as much as possible this year calls for the use of extreme measures. As a rule, stable manure is the only fertilizer used to any extent in Wisconsin and this ought to be used this year just as far as it is available, but the unusual conditions call for the use of other fertilizers where stable manure is not available.

Such fertilizers should be used on the most valuable crops and those which produce the largest amount of food per acre, such as potatoes, sugar beets, beans, corn and truck crops generally. While it is usually best to apply these fertilizers broadcast, it is better when the object is to get the maximum returns the first year of use to apply them in the hill or drill, the amount when used in the latter way being ordinarily about half the usual rate when applied broadcast and worked in.

The proper kind of fertilizer to use depends largely on the character of the soil, while the amount is determined by the crop. Light-colored soils which are low in vegetable matter, whether they are of a clay or sandy nature, need the element nitrogen chiefly, but usually it is profitable to use some phosphorus with it. Potash will ordinarily be secured from the store already in such soils. Dark-colored upland soils such as are commonly called "prairies" are more apt to be in need of phosphorus, but unless they have been manured recently will need some available nitrogen also. Marsh soils do not ordinarily need nitrogen, but do need phosphorus and potash.

The abnormal conditions this year have led fertilizer manufacturers to use practically all their fertilizing materials in the manufacture of their standard brands so that with the exception of acid phosphate and to a very limited extent of dried blood and ammonium sulphate, the mixed fertilizers are the only ones available. The fertilizer manufacturers indicate the composition of their mixed fertilizers by a series of three figures, the first of which gives the percentage of nitrogen, the second phosphoric acid and the third potash—a 2-8-2 fertilizer being one containing 2 per cent of nitrogen, 8 per cent of phosphoric acid and 2 per cent of potash. For most crops on upland soils a fertilizer containing from 2 to 3 per cent of nitrogen, about 8 per cent of phosphoric acid and no potash should be used and when applied near the hill, as in the case of corn or beans, 150 to 200 pounds per acre is about all that can be used without danger of injuring the germinating seed. When applied in the drill, as for potatoes, sugar beets or other drilled crops, 300 pounds may be used.

These fertilizers can be applied in the case of corn, potatoes, beans or beets by the use of planters having fertilizer attachments. Under these conditions the fertilizer does not come in immediate contact with the seed, but is mixed with a little soil so as to prevent it from burning the germinating seed. If the fertilizer is not applied at the time of planting it can be put on later even after the crops have been up one to two weeks, but as far as possible they should be applied with a machine which will drill the fertilizer in near the hill or drill, but place it from one to three inches below the surface so that it will be in contact with soil moisture. Less benefit is received the first year from applications of fertilizers applied broadcast and cultivated in, though this method would still be profitable under present conditions, since any plant food applied in this way and not absorbed by this year's crop would be available to next year's crop.

Since most of the potash ordinarily used in this country is imported from Germany and there is very little produced here, the price for this element has become abnormally high and only under very unusual conditions will it be profitable to use it. On marsh soils for truck crops, however, a fertilizer containing little or no nitrogen, 8 to 10 per cent of phosphoric acid and 2 to 3 per cent of potash might be used this year, using about the same quantities recommended for use on the different crops when grown on high land.

A. R. Whitson.
College of Agriculture.

POTATOES—LAST CHANCE.

I want everyone to see my great offer of Potatoes and Seeds on page 8. There never was another such valuable Potato as the true Early Six Weeks and now is your chance to get them at little cost. Order quick. This offer will not appear again.—A. G. Cook.—Adv.

Two Guernsey Events

Thursday
June 7, Waukesha, Wis.

TENTH Annual Consignment Sale of the Waukesha County Guernsey Breeders' Association will be held. **Sixty pure-bred males and females will be offered.** Successful dairying depends chiefly upon the cow and it will therefore pay you to come and look over Waukesha county's bred-for-production Guernseys.

Wednesday
June 6, Pewaukee, Wis.

THE annual summer meetings of the **Western Guernsey Breeders' Association** and the **Waukesha County Guernsey Breeders' Association** will be held jointly at the farm of George McKerrow & Sons Co., Pewaukee, Wis. Come and bring your friends with you to these two important events. Send for catalog of our sale.

Waukesha County Guernsey Breeders' Association

Purebred Registered

HOLSTEIN CATTLE

The broad highway to success is persistent and intelligent application to something worth while. A successful 60-year-old dairyman said, "I have made the greater part of my money since I was forty-five. Up to that time I was making mistakes. I corrected a host of mistakes and ideas about cows and have made nearly all the money I have since that time." The difficulty is that some dairymen never wake up. Any farmer who will devote a short time to a study of the supremacy of Holstein-Friesian cattle as profitable milk producers and as dual purpose cattle will be able to turn his dairy operations to a profitable basis. Send for free literature. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklet.

Trust John W. Bate

To Build a Car As You Want It

The latest Mitchells will show you that John W. Bate is a master at building cars.

You have never, at any price, seen a car so complete. You have never seen such luxury, so much over-strength, at anywhere near our price.

How Mr. Bate Works

Mr. Bate, the great efficiency expert, has spent 14 years on Mitchells. The latest Mitchell is his 19th model. It is the final result of 700 improvements.

But he started by building this model plant, which now covers 45 acres. He spent millions of dollars to build and equip it to build this one type economically.

Nowhere else in the world could a car like the Mitchell be built at the Mitchell cost. His methods will save us on this year's output about $4,000,000.

It is that saving which pays for all the Mitchell extras, and gives men these matchless cars.

31 Extra Features

There are 31 features in the Mitchell which nearly all cars omit. Things like a power tire pump, reversible headlights, dashboard engine primer, ball-bearing steering gear.

There is more beauty and luxury than was ever before combined in a modest-priced car. The reason is, we build our own bodies. And all we save goes into this extra luxury.

And no other car has Bate cantilever springs. They make the Mitchell ride like an aeroplane. In two years' use, on many thousand cars, not one of these springs has broken.

100% Over-Strength

But the chief Mitchell extra is double strength in every vital part. In the past three years we have doubled our margins of safety. We are making the Mitchell a lifetime car. Three of these cars have already run over 200,000 miles each. That's 40 years of ordinary service.

Over 440 parts are built of toughened steel. All safety parts are vastly over-size. All parts which get a major strain are built of Chrome-Vanadium.

In these days of high steel prices, any car which is built this way is either rare or costly.

Everything You Want

Mr. Bate has worked 14 years to combine in Mitchells everything you want. He spent one year in Europe, to glean the best ideas from there.

Before designing this year's Mitchells, his artists and experts examined 257 new models. So all the known attractions are combined in these Mitchell cars.

One Size, $1195

The smaller Mitchell—Mitchell Junior—costs only $1195. Yet it is a powerful Six, with a 120-inch wheelbase. You never saw such value in a car around this price.

But the larger Mitchell offers special value. See both sizes. See the extra features, the extra beauty and the extra strength. You will want a Bate-built Mitchell then for the car you buy to keep.

If you don't know the nearest Mitchell dealer, ask us for his name.

THE WISCONSIN FARMER

VOL. XLVI. NO. 21. THURSDAY, MAY 24, 1917. WHOLE NO. 1843

A DAY ON PABST STOCK FARM

ONE of the best proofs of the confidence men have in dairy cows is the extent and size of their investment in buildings and equipment for such stock. This is well demonstrated in the case of the Pabst Stock Farm, of Oconomowoc, which was converted into a Holstein establishment about ten years ago, after it became evident that the automobile had forever taken the place of the light horse in the hearts of the American people. Mr. Fred Pabst began with only a few Holsteins and with considerably less land than the farm now includes. However, the earnings from the herd during the first few years convinced him that dividends would also be forthcoming on a much increased acreage and with a greater number of cows. He purchased adjoining farms and more stock, until today he has 1,400 acres of land all in one tract, and about 300 head of excellently bred Holsteins that yield an annual income of approximately $25,000 by the sale of milk and bull calves.

For convenience, the farm has been divided into smaller units. Each unit has on it such buildings as serve the purpose best. The cattle are divided into two milking herds and one lot of cows under test. The large barn, formerly used for horses has been converted into a test barn. It can accommodate thirty-seven cows, giving each cow plenty of room and freedom of movement, as the box stalls are 12x12 and fitted with automatic drinking fountains and mangers. Plenty of windows on each side of the barn and a complete system of ventilation give the animals abundant light and air on even the darkest days. At first glance one might think that the buildings are rather large and elaborate, but a tour through any of them will convince the visitor that there are no frills about the place. Everything has been built with a view towards future increase and with the idea of permanency uppermost in mind. The buildings will be just as substantial and in as good condition twenty-five years from now as they are today. There is economy in building for permanency. With the exception of several wooden structures, there will be little money expended for upkeep during the next few years. The size of the buildings will permit of enlarging the herd to a maximum of 500 head, and this is what Mr. Pabst is looking forward to. The buildings that are now being completed on the place are a calf barn of hollow tile that will hold 112 calves, and a hospital barn, also nearing completion, where all cows having troubles during calving, or any animals requiring special attention, can be safely kept and properly cared for. A power plant, creamery and ice house and laundry constitute another building where the output of the entire herd can be taken care of in case this is necessary. A large elevator, to which all grain harvested on the farm will be brought, is situated on one of the farm units. From here each herd will be supplied with the necessary grain and ground feed and charged according to market prices. Thus each herd will have a separate account, stating exactly the expenses for the month, from which the profits can be more accurately figured.

There are no cows on the place that have not been tested. Every cow must produce at least twenty pounds of butter in seven days under test in order to hold her place on the farm. No females are sold from the farm except such that have outlived their usefulness. The large size of Pabst-bred Holsteins makes it possible to realize a good price even for cows sold over the scales. Two cows recently sold to the butchers brought $127 and $136, respectively.

TEST BARN, FORMERLY TRAINING STABLE, FRED PABST FARM, WAUKESHA COUNTY, WIS. CONTAINS THIRTY-SIX WELL-LIGHTED AND WELL-VENTILATED BOX STALLS.

The breeding that has been followed on the Pabst farm is along Korndyke lines. The present senior herd sire is King Pontiac Champion, whose daughters have made creditable records in the seven and thirty-day tests. He is by the bull, King of the Pontiacs, which has sixteen daughters above thirty pounds, among which is K. P. Pontiac Lass, with a record of 44.18 pounds of butter in seven days. He has in all nearly 200 A. R. O. daughters. King of the Pontiacs is by Pontiac Korndyke. The junior herd sire was purchased by Mr. Pabst at the famous Dollar sale for $12,500. He is Korndyke Segis Johanna. His sire is Johanna McKinley Segis by the noted King Segis, and out of Johanna DeKol Van Beers, with a record of 40.07 pounds of butter in seven days and 151.39 pounds in thirty days. Korndyke Segis Johanna is also strong on the dam's side, being out of Pontiac Lady Korndyke, with a record of 38.03 pounds of butter in seven days. She is also by Pontiac Korndyke, the grandsire of the senior herd bull. Thus two herd bulls are bred along similar lines and carry the strong blood lines of the Korndyke family.

Some excellent cows on the place that have records to their credit include Pabst Hengerveld Colanthus, with a record of 31.51 pounds of butter in seven days and a yearly record of 873.56 pounds of butter. A bull calf from this cow by King Pontiac Champion has been retained in the herd for a herd sire. Edith De Kol Burke Hengerveld by De Kol 2d Butterboy has a record of 33.86 pounds of butter in seven days. She has just freshened again, giving birth to two bull calves, and is promising to surpass her present records. This would prove her vigor and constitution, producing in a little over eleven months three healthy calves and two splendid records.

The system of raising calves on the Pabst farm and developing in them constitution and hardiness is a novel one. From the ages of five months until about a half year before calving, the young stuff is wintered out in open sheds. Here they remain under the most severe weather conditions on a moderate amount of grain and plenty of roughage. The stock comes through this period of open-air living in excellent shape. They are strong and hardy and have developed properly under natural conditions. They are now fed for the exacting work of record production and calving. Seven of these larger sheds are located on various parts of the farm where, during the past season, 140 head of young stuff did particularly well in the face of one of the most severe winters Wisconsin has experienced. A new calf barn just being finished will hold 115 head, where calves of three months and over will be stabled in like manner. Accord-

ON THE FRED PABST FARM, NEAR OCONOMOWOC, WIS. MILKING HERD OF FIFTY-SIX IS QUARTERED IN BUILDING IN FOREGROUND. THE SECOND IS BARN FOR HORSES NEEDED TO CARRY ON FARM OPERATIONS.

It Takes Punch In the Power To Do Farm Work

TOY tractors have fooled a great many people, makers and buyers alike.

Theory won't plow a stony field or steadily drive a threshing machine. Nothing but strength, weight and power will do this kind of work.

The Nichols & Shepard Co. build *work* engines and build them so that you get *paying results* when they are at work.

Red River Special Line

Two sizes of Oil-Gas Tractors, 25-50 and 35-70 H. P., full power on kerosene.

Your neighbor is running an engine of our make that will exactly fit any need you may have. He bought it because he wanted the best and he has written to us to say that he got it. His letter is published in a little farm paper that our nearest branch house will be glad to send to you free with a complete catalog. Write for them and secure reliable home information before you buy a power outfit of any kind.

Nichols & Shepard Co.
In Continuous Business Since 1848
Builders Exclusively of Red River Special Threshers, Wind Stackers, Feeders, Steam Traction Engines and Oil-Gas Tractors
Battle Creek Michigan

Cushman Light Weight Engines

For silo filling, grinding, sawing, shelling, and all farm work. 8 H. P. 2-cylinder weighs only 320 lbs. May be mounted on Corn Pickers and Hay Balers. 15 H. P. only 780 lbs. 4 H. P. Cushman weighs only 190 lbs.—besides doing all other work, it is the original and successful engine for the binder. Also may be attached to **Corn Binders and Potato Diggers.**

8 H. P. 2-Cylinder Weight Only 320 lbs.

Cushman Engines are all-purpose engines. Easy to move around from job to job. Have Throttling Governor, Schebler Carburetor and Friction Clutch Pulley. Cushman Engines are not cheap, but cheap in the long run. Ask for book on Light Weight Engines.

4 H. P. Handy Truck

Cushman Motor Works
855 North 21st St., Lincoln, Nebr.

PLANS FREE — Build Your Own Batch CONCRETE MIXER

Along with our iron parts we send FREE plans, and permit to build your own concrete mixer under our rights. In that way you secure a practical mixer for all cement work at a cost so low you can not afford to mix concrete by hand.

Save big money and backbreaking labor. Sheldon's Batch Mixer repays its cost ($11.50 up on first small job—lasts for years. Ideal machine for farm jobs—designed by a farmer for farmers. No other like it. Patented. Mixes 2 1-2 cu. ft. a minute—keeps 1 to 6 men busy. Has chain drive, self-tilting dump, easily moved, all parts guaranteed. Does work equal to $200 mixers. Built-up machines, hand or power (1 1-2 h. p.)—or you can buy the iron parts and make your own machine.

Get Catalog and Special Offer

Shows our full line of mixers which are sold direct to you on strong guarantee. 30 days trial privilege. We want ten men in every county to accept our special co-operative offer right now which will help you to secure a machine at little or no cost. Write us today.

SHELDON MFG. CO.
Box 393 Nehawka, Neb.

Mix Your Own Concrete

TRY BEFORE YOU BUY

Select the bicycle you prefer from the **44 styles**, colors and sizes in the famous **"Ranger"** line. We send it on approval and **30 DAYS TRIAL**, *freight paid to your town*. Return it if not pleased and the trial costs you nothing.

Write at once for large illustrated catalog showing *complete line* of bicycles, tires and supplies, and particulars of *most marvelous offer* ever made on a bicycle. You will be astonished at our low prices and *remarkable terms*.

RIDER AGENTS Wanted —Boys, make money taking orders for Bicycles, Tires and Sundries from our big catalog. **Do Business** *direct* with the leading bicycle house in America. Do not buy until you know what we can do.

MEAD CYCLE COMPANY Dept. C-184 Chicago

Questions and Answers.

Lighting From Magneto.

I have a Splitdorf Model A Magneto on my Overland car. Could I light one or more lights from the magneto?

Answer.—It would not be possible.

Moth Balls in Gasoline.

I saw in your paper that moth balls may be used in a gas engine to give it more power. May they be used in a Ford engine without injury to the engine in any way? How many should be used to the gallon of gasoline?

Answer.—We have never heard of injury to an engine from the use of moth balls. Use twelve moth balls to fifteen gallons of gasoline.

Repairing Bicycle Wheel.

Please tell me how to fix a bicycle rim together where it is spliced. Will glue hold? In the first place the rim was warped out of shape. Tell me what will hold best when the bicycle is used in wet weather.

Answer.—Clean all the old glue out of the splice, so as to expose fresh wood all over the surface of the splice. Apply LePage's or other good liquid glue to the surfaces and clamp the splice together in a vise. Leave the rim in the vise for twenty-four hours so that the glue will thoroughly set. Then give the rim two coats of good varnish, which protects it to some extent from the weather. If it is not too badly warped it may be pulled into shape when the spokes are tightened.

Mixing Gasoline and Kerosene.

Would you please tell me whether a mixture of 50 per cent gasoline and 50 per cent kerosene will hurt a motor in any way? I have been told that it thins the oil and causes more friction. Is this correct or not?

Answer.—Kerosene is much harder than gasoline to vaporize and burn. Therefore, some of the kerosene may remain in the cylinder in a liquid state. This unburned kerosene works down past the piston into the crankcase and thins the oil. On this account, the friction increases and there is danger of the bearings burning out. Your carburetor will burn this mixture more successfully if it is water jacketed and provided with a hot air hose on the air inlet. In any case, the oil in the crankcase should be watched and replaced when it begins to become thin.

Dressing a Polishing Wheel.

I would like to know how to get emery dust to stick to a cloth wheel for polishing purposes. I have a cloth wheel that I clamp on an emery wheel shaft for polishing purposes.

Answer.—Grind off the end of a file to a sharp cutting edge, like a wood turning tool. Then place the cloth wheel on the shaft and set the hand rest near it. Start the wheel and true it up, using the old file as a turning tool. With the wheel still on the shaft apply hot common glue, turning the wheel by hand when applying the glue. This causes the fibers of the wheel to lay back. Have the emery dust in a shallow tray. Bring this tray up on the underside of the wheel and lightly press the emery against the wheel, slowly turning the wheel by hand. Then allow the wheel to dry overnight. If the wheel is removed from the machine it should be replaced with the same side out; otherwise the fibers of the wheel will run in the wrong direction.

Generator and Storage Battery.

Please answer the following questions in the Farm Mechanics Department: How thick should storage battery plates be made? How many holes should be bored in them, and how far apart? I have a fifty-volt, four-ampere motor of the upright type. Will this work as a dynamo? Will it supply sufficient current to charge a six-volt, twenty-five-ampere hour storage battery? The motor runs at 1,600 R. P. M. and is rated at one-sixth horse power.

Answer.—Storage battery plates are usually made about three-sixteenths of an inch thick, with as many holes in them as it is possible to have without making the plate too weak. The holes are cast instead of drilled. About one-sixteenth of metal is left between the holes, which are usually rectangular, about one-fourth of an inch wide and five-eighths of an inch long.

Your motor will work as a dynamo. You will need to move the brushes several degrees if the machine sparks at the commutator when used as a dynamo. It will furnish sufficient current to charge the storage battery you mentioned. Connect three fifty-volt sixteen-candle-power carbon lights in parallel between the generator and the battery to prevent the battery from charging too fast.

Steam Turbines.

Are there any locomotives today that are driven by steam turbines? If not, have they ever been tried out? Why do locomotives use air for the brakes, when steam is available?

Answer.—The steam turbine principle has not been applied to locomotive engines principally on account of the difficulty of starting and stopping; also varying the speed. The steam turbine does not work well at a slow speed. On account of the inertia of the wheel it takes some time to start it and also some time to stop it. Some of the larger ones run twenty minutes after the steam is shut off, due to the inertia of the parts. The steam turbine would not have much pulling power at low speed. The locomotive must start and run slowly under a heavy load.

Air is an ideal medium for setting brakes, on account of its elasticity and the ease with which it flows through pipes. Steam could not be used except on very short trains, as it would condense. It might be possible to use steam for the engine brakes, but as air must be used for the train it has been found better to use air on the engine also. The brake on every car on a long train may be set by allowing a small amount of air to escape from the main air pipe, or "train line," as it is called.

Some Steam Engine Questions.

How large a boiler would be required for a steam engine with a cylinder one and one-half-inch bore and three inches stroke? Would it be practical to make a two-cylinder opposed steam engine with the steam working in just one end of each cylinder so that one piston would turn the crank half way and the other piston would turn it the other half? Would it be better to have just one cylinder with the steam working on both sides of the piston? Please publish a diagram of a single-cylinder stationary steam engine with the steam working on both sides of the piston.

Answer.—Figure 1 shows a sectional view of an ordinary slide valve steam engine. D is the slide valve, E the exhaust port, P the piston, R the

FIGURE 1.

piston rod and S the valve stem. In the position shown, steam is just beginning to enter the head end of the cylinder. The crank end of the cylinder is connected with the exhaust port

FIGURE 2.

by the chamber on the under side of the valve. Figure 2 shows the position of the crank and the position of the eccentric when the valve and piston are in the position shown in Figure 1. The direction of rotation is indicated by the arrow.

A two-cylinder opposed engine with steam working only on one side of the piston would not be as efficient as a single-cylinder engine with steam working on both sides of the piston, as there would be more heat lost by radiation, and consequently more condensation of the steam. Your boiler should have about four square feet of heating surface if its working pressure is 100 pounds per square inch.

Horse Power Required For Brick Plant.

I operate a brick plant. I use a twenty-horse-power steam engine connected to a forty-horse-power boiler to run the brick-making machine. Would you please tell me through the Farm Mechanics Department how large a gasoline engine would be required to run the brick machine?

Answer.—If your steam engine is fuly loaded, you should purchase a gasoline engine of not less than thirty horse power, as your load is somewhat variable. If you are making brick from a very hard shale, it might be advisable for you to get a forty horse power engine, as a gasoline engine will not take care of a sudden overload as well as a steam engine.

The Valve-In-Head Motor.

Has a valve-in-head motor more tendency to overheat than other motors? Does the spark plug being over the center of the piston cause the motor to overheat more than if it were on the side? Does a valve-in-head motor have more power than other motors? Do the spark plugs and cylinders suffer more from carbonization?

Answer.—Other things being equal, the valve-in-head motor has slightly more power and no more tendency to heat than other motors. It is no more liable to carbon troubles than the others. Overheating is usually caused by too high compression, due to the accumulation of carbon in the cylinders, to running with the spark retarded, to a poor water circulation, or to a loose fan belt. The location of the spark has little effect on the overheating if the spark is correctly timed.

Save Money on Twine.

To the Editor:—Our club has been organized since last November, starting with eleven members, and we now have ninety-seven. We meet once a month at the homes of the members and have good programs and good social times. Last year the members of the club went in together for binding twine and have done the same this year, at a saving of about $250 on the whole bill. We would like to work into more coöperative buying. Our last meeting was held at the home of Gilbert Gravesdale, ten miles north of Beloit. Mrs. R. C. Murdock, of Beloit, spoke of the Beloit center and the interests of the Lincoln Chautauqua. L. A. Markham, of Janesville, talked to us concerning the seed potato problem. Mrs. Carl Reimer gave a short report of a visit to the Harlan consolidated school and suggested some benefits which the community northwest of Beloit would derive of such a school. Earl Pallett told us of the financial problem of establishing a consolidated school here. Mrs. O. D. Antisdell, our Rock county superintendent, told us how to handle the legal phases of the problem. Luncheon was served to about 100 who were present. The next meeting will be at R. A. Barry Farm, June 13th.

Mrs. Dean Van Camp, Sec.

MODERN GAS TRACTOR

New Volume Describes All Types and Sizes.

A book of 480 pages entitled "The Modern Gas Tractor," written by Victor W. Page, has just come from the press. Mr. Page is recognized as an authority on self-propelled vehicles and internal combustion motors. In this book he explains everything so as to make it intelligible to one who is not an expert along mechanical lines. This book contains several chapters on driving the tractor on field and road, goes into the question of cost of operation, and gives many valuable hints on repairs. Ignition systems are described as well as all types of gasoline and kerosene vaporizers and carburetors. The book contains over 200 illustrations. It sells for $2 and The Wisconsin Farmer is in a position to supply it to its readers at this price.

The Wisconsin Farmer

FAMILY CIRCLE TALKS BY THE PUBLISHER

WELCOME OUR EMERGENCY FIELD MEN.

NEVER in the history of Wisconsin, in my judgment, have the leaders of agricultural thought had such splendid opportunity as now to become leaders in agricultural practice. Good patriotic men from our experiment station have been engaged in important research work, and this work has been carried out to the people of our state in book, circular and pamphlet form. But when May 1st arrived this year there was a general exodus from Madison on the part of young men who had been filling the classes at the college of agriculture. These young men, honor to their patriotic purposes, felt that they could be of greater good to their state and their country in this hour of need by getting out into the fields. I am very much gratified that the heads of our state institutions have taken this view of things and that they have gladly arranged to relieve the young men from class duties and let them go to the fields as well as to the front. When I see young men loitering around the city streets these days I look upon them as "slackers." While I am a fervent believer in study, and support with all my heart and soul the work of our agricultural college and our county agricultural schools, I cannot but believe that the classroom is no place for these young men until after our next harvest. So it has pleased me very much to see our young men and the heads of our schools coöperating along these lines.

My readers who have known of this general exodus to the fields may have wondered what there would be left for the college "professor" to do. But they have certainly made a mistake if they imagined for one minute that these aggressive men would be content to sit idly by, draw their salary and wait for the students to come back to Madison after the harvest next fall. Our college of agriculture faculty is not made up of that kind of men. The instructors in our county agricultural schools are not that kind of men. These men have spent a big part of a lifetime preparing for their work in the classroom, and I think we often forget that they are in reality much more in the student than the teacher class. Take our good friend R. A. Moore, for instance. Some of us may be prone to look upon him as a "professor," but the fact is he is just an exceptionally bright student, plodding along day after day trying to bring some new truths to light which will be a help to the farmers of our state. He stops long enough now and then to give us the results of his work, and then digs in again, proving over and over what he has previously discovered, experimenting along new lines—always and forever a student. Our beloved Dr. Babcock has been a student for half a century or over—a master of many principles, to be sure—but always a student, never failing in his efforts to more firmly establish truth, and to present his discoveries in such form that they will accomplish the largest good. I might go ahead and mention the names of several score of our experiment station workers, practically every one of whom devotes more time each day to studying than the students they meet in their classrooms.

I regard it as a strong indication of our intention here in Wisconsin to make our defense work practical, that many good men from our college of agriculture will be found out in the field work all this summer and until late in the fall. Coöperating with the Wisconsin State Council of Defense, and working more directly under the county councils, a number of members of the experiment station workers have accepted the duties of temporary county agents. In my judgment both the counties which employ these men and the men themselves will be greatly benefited by this arrangement. Several counties have been able to secure the services of men who would not be available for such work in ordinary times. And I feel that the men themselves will be greatly benefited by their close touch with the farmers. If any prejudice exists among the farmers of Wisconsin against the "county agent" system, let us do away with it at once. Let us give the field men coming in from the experiment station staff a hearty welcome, and we may be assured that all of these men will return to Madison in the fall or winter much better equipped to proceed with their studies along experimental lines. I bespeak for all the county agents of our state, all the emergency field men, and others who have temporarily rearranged their plans in order to help Wisconsin make a splendid showing in food production, a hearty welcome among the farmers with whom they will be colaborers. These emergency field men should be just as much interested in, and enthused concerning their work as they would be if they were made officers of a regiment.

SOME HEALTH HINTS.

I WONDER if a few timely health hints might not be appropriate just now? Summer is fairly upon us. We who live in the country should enjoy the best health of all people, but such is not always the case. Typhoid, malaria, dysentery and many other dread diseases are common to farmers. Often it is the water supply which is to blame. I do not lay any claim to being a medical authority, but I want to pass on for your guidance a few health hints I found in a newspaper the other evening, hints which are quite simple, but which may mean life or death in the end. Here they are:

A good water supply in the spring may save an undertaker's bill in the fall.

It's the spring fly which makes the summer pest.

A mosquito breeding pool may mean malaria later on.

Spring gardening has lengthened many lives.

Fresh air is the best tonic.

Today is the best time to begin to build for health.

Nothing is more important than that we guard against disease. Let me urge upon all my readers the importance of seeing if their water supply is of the best, if their houses are well ventilated and screened and if mosquito-breeding ponds are dried up and a constant source of infection thus removed.

EXEMPTING THE FARMER FROM THE DRAFT.

I AM FIRMLY convinced that when the army-draft law is put into effect the authorities will see that it is wisdom to exempt from conscription all men engaged in farming. The fact (and I believe it is realized by those who have studied the situation carefully) is that it is fully as important to raise crops, so as to sustain both the fighting forces of the nation and the stay-at-homes, as it is to take up arms and follow the flag across the shot-riddled field between the opposing trenches.

The farmer is a patriot. It was he who fired the shot which was heard around the world at Lexington, the shot which started the war to free the American colonies. Forth from the farms sallied the boys and men, in the civil war, to fight for the unity of the nation. Forth from the fields and feed lots went the boys and men in '98 to free Cuba and to advance the progress of civilization, shutting an iron door in the face of barbarism on the western continent. Forth from the farms would go many and many a boy and man should the president call for volunteers now to enter the lists against militarism and tyranny. But when it comes to looking over the nation and saying, with the force of law behind the edict, "You must leave your pursuit, take up arms and march against the foe," I believe that it is the course of wisdom to exempt the farmer from such service. Many a farm boy, fired with patriotism, yearning to take up arms and touch shoulders with comrades in khaki, will disagree with me. But I am looking at the matter in the larger light of the greater service to our nation and to humanity in general.

No army can win battles unless it is properly clothed and nourished. No army can long continue to be so sustained if the farmers, as a whole, are called from their tasks and made to bear arms instead of operating the implements of their useful and honorable calling. If we send the farmers of America—and particularly of the grain belt—to the front, our own nation must go hungry before the year is out; likewise those who are dependent upon our fields and herds, even though they live far away across the seas, must also go hungry. It is fully as necessary, fully as patriotic, to till the fields and care for the herds this year as it is to fire the machine gun, charge across "No Man's Land" into the enemy's trenches or otherwise take an active part in the battle of the bullets.

Congress realizes this. The president realizes this. That is why they insisted on an exemption clause in the war-draft bill, providing for the excuse from compulsory service in the army of "persons engaged in industries, including agriculture, found to be necessary to the maintenance of the military establishment or the effective operation of the military forces or the maintenance of national interest during the emergency"—I am quoting the exact words of the law. If it were not for this, the arm of conscription would reach out and take from our fertile grain-belt fields every boy and man between the ages of 21 and 30 and send them out to be cannon fodder, leaving fields untilled, herds uncared for and production virtually at a standstill.

The grain belt will be called upon to send a large number of men to the front. It has over 2,000,000 men between the ages of 21 and 30. One out of every twenty of these men will be called to the colors within the next few months; another quota within a year. In the next two or three years one out of every eight or ten will have been conscripted. But there are a dozen young men in the city to be spared for every one in the country that can be surrendered from the fields of production for the fields of destruction.

I am going to give you a table showing the number of eligible young men in the grain belt, according to the last federal census and the most authentic estimates. It is as follows:

State	Males between 21-30, both incl., April 15, 1910 (actual)	July 1, '17 (estimated)
Illinois	578,402	539,500
Iowa	199,490	199,000
Kansas	160,657	175,900
Minnesota	219,688	244,700
Missouri	303,132	315,600
Nebraska	119,408	129,400
North Dakota	67,112	89,000
South Dakota	65,563	80,500
Wisconsin	211,977	229,500
Total	1,925,429	2,003,100

Those who will go first will be determined by lot, their names drawn from a box just as men's names are drawn for jury service. Boards will be established in every county (one for every 30,000 population in cities) to determine who shall be excused, after their names are drawn. Higher boards, one for each judicial district, will review the decision of these county boards, and so by the first of September we shall have an army of a half million men ready to drill, preparing to defend the stars and stripes wherever they shall lead, in the name of justice and honor and righteousness.

I am opposed to war. I abhor war. Yet if war must come, I believe congress has done the right thing in passing this conscription bill, placing the burden of service upon the many, instead of upon the few. But it is right to exempt the farmer, for he is needed in the field; he will fight there even more determinedly and effectively than in the trench and redoubt. And fight he must, without thought just now of the pay he shall receive or the orders he may be given which he does not at once see the use for. The farmer in the field this year is a soldier under orders; he must obey or be a traitor. Only to this extent will he deserve the exemption which has been granted him and which is his by every right.

TWO WAR STORIES AND A VISION OF PEACE.

OUT of the murky blackness of war there flashes, from time to time, a ray of light which carries the message that human love and sympathy—the very warp and woof of civilization's fabric—are not altogether forgotten.

The other day I read a war correspondent's story of how a baby suddenly appeared, crawling across that narrow strip of hell, known as "No Man's Land," between the French and German trenches. How it had gotten there, in the midst of earth's inferno of death and destruction, no soldier knew. Perhaps it was some orphan left by fleeing families. At all events, there it was—the one human figure on the desolate landscape. The soldiers in the opposing trenches were stunned. For a moment they could not grasp what they saw, it was so foreign to everything that the day's work meant to them. All firing stopped, heads began to pop up over the trenches on both sides, and then a German soldier leaped from cover and, running out, picked up the little armful of humanity and carried it tenderly and laughingly back to safety. Not a shot was fired, and when he reached the German line the French troops stood above their earthworks, waving their caps and cheering. It was some time before the fighting was renewed and then the firing was desultory and half-hearted. Thus, for a few moments, "grim-visaged war had smoothed its wrinkled front," and the prophecy was fulfilled, which was written: "The lion shall lie down with the lamb and a little child shall lead them."

There is another touching story from the firing line which shows that the finest human sentiments

(Concluded on page 5.)

THE WISCONSIN FARMER, Madison, Wisconsin

Put Up a Good Silo This Year.

Just because Wisconsin has a silo to every third farm is no reason why we should let up on the campaign for more silos this year. We believe that every farmer who has one silo should have another one this year and every farmer who has none—well, it is difficult to conceive of a real up-to-date Wisconsin farmer having no silo at all. If such there be, let them get busy just as soon as possible. It is just as important to wage a campaign for saving every ounce of feed possible as it is important to campaign for bigger crops either through more intensive cultivation or greater acreage.

For half a century it has been well known that silage is one of the most economical feeds for the dairy cow and yet we haven't a tenth the number of silos we ought to have on our dairy farms. That silage is just as economical for the man with a beef-breeding herd who raises calves for the market or for him who fattens steers in the dry lot is a fact equally well, though more recently, established; yet there ought to be a hundred times as many silos on our beef farms as there are. Farmers are altogether too slow about building silos. It is time that they awake to the importance of saving the whole instead of two-thirds of the corn and other forage crops of that nature. Let the farmer show his patriotism this year by building more silos. This would not only help solve the food problem but it would also be of financial benefit to the farmer himself.

There never was a better time to build silos than right now. If you need money, tell your banker that you want to do your "bit" in helping to conserve the food supply of the country by building a silo and the chances are that you will have no difficulty in getting the money. Get your neighbors to do the same thing. Organize silo clubs and buy a cutter coöperatively. If it is impracticable to hire an engine to run it get a tractor and use it for other work on the side. The expense will not be heavy if three or four farmers club together. A silo will pay for itself in a single season. If corn is worth $1 a bushel next year, a forty-bushel crop will have a value of $40 an acre and that, as is well known, is only two-thirds its food value. The whole crop, if put in a silo, would have a value of $60. A forty-bushel crop will produce eight tons of silage, hence a 160-ton silo would hold twenty acres of that kind of corn and instead of having a market value of $800 it would have a feeding value of $1,200, and thus effect a saving of $400 and possibly a good deal more. If beef prices remain high, and there are no indications of materially lower prices prevailing next year, a much larger saving than the amount mentioned would be effected.

Not only should thousands of silos be built in every state this spring and summer but each silo should be filled more than once. The best silage is secured if the corn is cut after the kernels are glazed and the leaves are still green. Earlier cutting means loss of organic matter and later cutting means the loss of some of the leaves and the production of more fiber. The ideal time to cut corn for the silo, therefore, is as soon as it has reached maturity or within a few days of that time. The same applies to other silage crops. This, however, does not mean that good silage cannot be made from cured shock corn that was cut and shocked at the time it was in the best condition for the silo. To get the most out of our corn and the greatest use out of our silos it is highly desirable, especially when a man has more than one silo, to fill them more than once a season. Fill your silos in the fall when the corn is ready and then cut and shock as much more of the corn or other crop as can be utilized in the form of silage during the winter season and the following summer, and put this in the silos as soon as they have been emptied. First, empty one silo and refill it with cured shock corn; while this second filling is fermenting feed out the silage from the second silo and when that is gone refill this silo with cured corn. In this way a maximum of corn can be stored in a minimum of silo space.

The same thing can be done even if only one silo is available, but not with as satisfactory results because the dry cut corn should undergo some fermentation before it is fed. When filling a silo with dry corn arrangements must be made for adding a large quantity of water to the cut corn while it is being put into the silo. This is not a new method, but one that has been practiced by many farmers for a number of years with satisfactory results. It requires about one ton of water for each ton of dry, cured shock corn, and the water should be well mixed with the corn while it is being cut up and blown into the silo.

A Year of Work.

Never was it more important than now that the subscriber and the editor of a farm paper like The Wisconsin Farmer keep in close touch and harmonious copartnership. To this end we wish to urge upon all the subscribers to this paper that they attend to the important matter of their subscription without delay. This bids fair to be the biggest crop year America has ever known. Every farmer must keep in close touch with every practical authority, so that there may not be a minute, a grain of seed or an ounce of energy lost. You cannot afford to miss a single issue of The Wisconsin Farmer. Therefore, renew your subscription promptly.

If you are bothered with anything about your farming operations, write to the editor of The Wisconsin Farmer and he will either give your letter his own attention, promptly, or will turn it over to a department editor chosen for his task because of his practical efficiency. Subscribe to The Wisconsin Farmer, use its columns and its editorial staff and realize the immense possibilities open to the farmers of this section this year as never before.

Serious Shortage of Farm Implements.

A condition exists in the implement trade that will vitally affect production this year unless a greater attempt is made than ever before to work in a coöperative way. On account of shortage in the steel supply, implement manufacturers have had difficulty in producing even 75 per cent of their regular output, and as a result there will be an exceedingly great reduction in the number of planters, cultivators, plows and harvesters sold this year. The exact condition of affairs has recently been set forth by a special committee of the National Implement and Vehicle Association. According to this committee, all new factories making tractor plows are unable to meet the requirements of their trade. The corn acreage has been decreased by the shortage of listers, the tool necessary to plant corn in fall wheat fields. A shortage of regular corn planters is also imminent. All this is occasioned not by lack of capacity in implement factories but by inability to secure raw material, particularly iron and steel products.

The production of implements has been less than normal since 1913. Tools in the hands of farmers are more nearly worn out than ever before. Dealers' and manufacturers' stocks are reduced to a low ebb. The increased food requirements mean increased acreage and more than the normal supply of implements is necessary if the situation is met. This condition is accentuated by a shortage of labor on the farms and the necessity for increasing the proportion done with machinery.

Steel companies, after a conference with officials at Washington, at first allotted to the implement industry only 50 per cent of their requirements of sheet steel for 1916. After serious objection, this allotment has been increased 25 per cent. This means that the implement manufacturers are only able in the future to make 75 per cent of the normal production of machines in which sheet steel is a considerable item, such as harvesters, binders, corn planters, grain elevators, etc.

There are sold to farmers in this country yearly approximately 100,000 harvesters and binders. This decrease in supply would result in decreasing the farmers' harvesting ability 1,250,000 acres. Allowing for the acreage production indicated by the government in 1915 crop analysis of 16.9 bushels per acre, we would have a loss of 21,125,000 bushels.

In addition to this, binders are used for the harvesting of oats, barley and rye, of which there are 50,000,000 acres planted per year and a corresponding loss would be experienced in these crops.

There are 80,000 corn planters a year sold to farmers of the United States. Reducing this output 25 per cent means a reduction of 800,000 acres planted, which, according to government report of production for 1915 of 28.2 bushels per acre, would mean a loss of 22,560,000 bushels of corn.

The conclusion to be drawn is simply this, that wherever it is possible those who are fortunate enough to own good implements should make it a special point this year to accommodate a neighbor who is not. This applies particularly to planters and to harvesting machinery. Sometimes makeshift methods can be employed in preparing the seed bed. For example, fall plowed land which would ordinarily be put in shape with the disk can in emergency be prepared with a six-shovel corn cultivator. In the matter of planting, however, it is entirely different and nothing will take the place of the check row planter or lister. On the average, there are not more than three or four days actual planting on any one farm, whereas if worked in proper rotation it would be possible to put in 200 or 300 acres of corn with the one planter. In no way can men serve their country better this year than to make it a special point to aid neighbors by loaning or exchanging implements wherever it is possible to do so.

War Against Wisconsin Weeds.

A. L. Stone, of the Wisconsin Station, reminds us through a Wisconsin Bankers' Farm Bulletin that weeds should not be allowed to go to seed. He gives reasons which are not new to most of us, but which will bear repeating. They are as follows:

1. Because they reduce crop yields, by using moisture and plant food which crops should have. Most weeds use more moisture than do crops because they grow larger and have greater leaf surface. They stand drouth better and in dry seasons may entirely kill the crop.
2. Because they shade, crowd and dwarf grain crops. They help to keep alive many plant diseases and ailments. In a weedy field, the plants stay wet longer in the morning and rusts and smuts have a better chance to grow. They also suck life from crop plants, as in the case of dodder on clover and broom rape on hemp.
3. Because they increase the cost of harvesting, by causing extra wear and tear on teams and machinery. By twining about the corn and grain, choking the binder, causing bundles to stick together, and making shocking difficult, weeds make themselves very troublesome and costly.
4. Because they lower the selling prices of farm products. Weeds cause dockage on the grain market, injure hay, give offensive flavors to dairy products where cattle are pastured in fields with weeds with strong odors and injure wool and furs.
5. Because they reduce the net profit on the farm by poisoning live stock (poisonous weeds are numerous), by requiring payment of taxes for weed control, and by requiring an immense amount of labor to help in their control.
6. Because they lower the selling price of farms. No farmer will pay the best price for weed-infested land.

Now the question is, what are we going to do to prevent weeds from seeding? Mr. Stone states the case in the following language:

By rotating the crops—For the dairy farmer, the following rotation is a good one: First year, corn in which no weeds go to seed; second year, oats or barley, seeding at the same time to clover and timothy, using eight pounds of red clover and six pounds of timothy seed to the acre; third year, two crops of clover hay or one crop of hay and one of seed; fourth year, a crop of timothy hay or pasture. In the fall of the fourth year, manure the sod and plow ready for corn the next spring. If the corn is kept clean this rotation will keep annuals from going to seed.

By carefully plowing, cultivating and harrowing fields before seeding. By the time the soil is ready to work in the spring, millions of young seed plants have begun to grow. Careful cultivation with a disk or spring-tooth harrow will kill them. The cultivation, however, brings more weed seeds up, and, if the weather is warm, in twenty-four hours another crop will have started. A weed killed at this time means one weed less in the grain or corn crop. At no time in their lives can weeds be killed more easily than when they first begin to grow. A little more time and labor than farmers usually give to the preparation of the seed bed will pay good dividends in the crop.

By using weeder, spike-tooth harrow and cultivator freely in all cultivated crops such as corn and potatoes. The weeder and harrow will do little harm to the crop if used in the afternoon after the plants have wilted. In the morning, when the plants are fresh, they break off easily and some damage will de done.

Don't wait too long before cultivating, cutting, or digging. Many weeds are very deceiving in appearance, and while seeming to be perfectly green and still in bloom, will be found to have ripened their seed. Red root, lamb's-quarters, chickweed, purslane and pigeon grasses are good examples of such weeds. There are many others having the same habit, so begin early and let none of them get to the seeding stage.

These suggestions are important if we would have maximum yields this year and also clean up the soil for better crops in 1918.

Wisconsin Legislature.

After long weeks of debate in the committee the tuberculosis bills have finally reached the floor of the assembly and three of them have been engrossed and ordered to the third reading. One has been voted to be indefinitely postponed, which, in plainer words, means that the bill is killed. The bills passed deal with the appraisement and payment of indemnity, the control of tuberculosis and other diseases and the eradication of tuberculosis.

The first bill relating to the payment of indemnities for slaughtered animals places the maximum appraisement at $200, the owner to be paid on the basis of 50 per cent of the appraised value of the animal.

The second bill on the control of tuberculosis prevents the transportation of animals afflicted with any contagious or infectious disease within the state and places a penalty on those who knowingly transport diseased animals for any purpose whatsoever without the sanction of the live stock sanitary board or the commissioner of agriculture. An amendment was added which specifically states that no animals known to be diseased by the owner should be exhibited at state fairs or county fairs.

The third bill which was ordered engrossed by the assembly aims at the eradication of tuberculosis through the testing of cattle by areas and provides for disseminating information regarding the disease, its effects and its control. This is all to be preparatory to a state clean-up that is to follow in future years. In case 50 per cent of the residents of any area in a petition ask for an inspection and testing of the cattle in that area the department is authorized to do so.

These bills have still to pass the assembly at the third reading and they will then go to the senate for concurrence. However, there is every indication that the bills will be favorably treated.

The senate committee on corporations recommended that the bill introduced by J. C. Hanson for the erection of warehouses on railroad sidings be put to death. Mr. Hanson is determined to make a strong fight for the bill which is backed by the Wisconsin Society of Equity. The bill gives the railroad commission power to supervise the granting of private leases by railroads. It is said that under present conditions railroads have refused

FAMILY CIRCLE TALKS—By The Publisher.

(Continued on page 3.)

are remembered even amid the crash of cannon and the rain of shells that mark the fall of empires and of thrones.

A young English airman had brought to earth a German airplane. A young German lay dead amid the wreckage of his machine. As the English boy descended towards his victim, the dead lad's eyes, still open, looked up at him without malice from a face that was frank and fearless. The Englishman, feeling of his lifeless heart, found a picture of a woman with gray hair and a kindly, motherly look, though her face was seamed with the lines of patient suffering. Beneath the portrait was scrawled, in a boyish hand, the words, "Meine Mutter."

The English boy bore the body to safety. Then, taking a pencil and paper from his pocket, he hastily scribbled some lines. Mounting in his machine, he flew over the German lines and dropped his message, while the German soldiers greeted him with cheers instead of bullets, for his brave deed in bearing their comrade's body to safety.

This is the letter which found its way to the bereaved German mother, written by the foeman who had killed her son:

It's your son. I know you can't forgive me, for I killed him. But I want you to know he didn't suffer. The end came quickly. He was very brave. He must also have been very good. He had your picture in his pocket. I am sending it back, though I should like to keep it. I suppose I am his enemy, yet I don't feel so at all. I'd give my life to have him back. I didn't think of him or you when I shot at his machine. He was an enemy spying out our men. I couldn't let him get back to tell his news. It meant death to our men. It was a plucky deed. We were covered up with brush. He had to come quite low to see us and he came bravely. He nearly escaped me. He handled his machine magnificently. I thought how I should like to fly with him. But he was the enemy and had to be destroyed. I fired. It was over in a second. Just a blow on the head as the machine crashed to earth. His face showed no suffering, only excitement. His eyes are bright and fearless. I know you must have loved him. My mother died when I was quite a little boy. But I know what she would have felt if I had been killed. War isn't fair to women. God! how I wish it were over. It is a nightmare. I feel if I just touched your boy he'd wake and we'd be friends. I know his body must be dear to you. I will take care of it and mark his grave with a little cross. After the war you may want to take him home. For the first time, I'm almost glad my mother isn't living. She could not have borne what I have done. My own heart is heavy. I felt it was my duty. Yet now when I see your son lifeless before me and hold your picture in my hand, it all seems wrong. The world is dark. O Mother, be my mother just a little too, and tell me what to do. HUGH.

Far back behind the battle lines, beyond the Rhine, the German mother read the note. Her boy was dead—her baby boy—the pride of her mother's heart! Her mind could not grasp the meaning, the reason, the significance of it all. What was this terrible monster that was crushing out the lives of her children and other mothers' children? Her boy and this English lad—they were the same kind. No hate against each other was in their hearts. What was it that was driving them forward into this torturing, all-consuming furnace? Vainly she tried to answer the questions and, then, with trembling hands and tear-dimmed eyes, she wrote laboriously, the following:

Dear Lad:—There is nothing to forgive. I see you as you are—your troubled goodness. I feel you coming to me like a little boy astounded at having done ill when you meant well. You seem my son. I am glad your hands cared for my other boy. I had rather you than any other touched his earthly body. He was my youngest. I think you saw his fineness. I know the torture of your heart since you have slain him. To women brotherhood is a reality. For all men are our sons. That makes war a monster that brother must slay brother. Yet perhaps women more than men have been to blame for this world war. We did not think of the world's children, our children. The baby hands that clutched our breasts were so sweet, we forgot the hundred other baby hands stretched out to us. But the earth does not forget; she mothers all. And now my heart aches with repentance. I long to take you in my arms and lay your head upon my breast to make you feel through me your kinship with all the earth. Help me, son, I need you. Spread the dream of oneness and love throughout the world. When the war is over come to me. I am waiting for you. DEINE MUTTER.

Such is the story of an English boy and a German mother, which is vouched for by one who claims to know. And what a story it is of the mothers and children of men, who are the ones that suffer most from war—always the ones who suffer most! But along with the pity and anguish which it brings is another feeling akin to hope and cheer—a dream of the day when such as they shall rule the earth, a vision of the time "when the war drum throbs no longer and the battle flags are furled, in the parliament of man, the federation of the world."

I hope that all my readers will hold the fulfillment of this vision before them as America's part in this mad nightmare we call war, and that whenever the spirit of hate and bitterness threatens them, they will recall this story of two of those who have suffered most.

James M. Pierce

certain coöperative bodies the right to erect warehouses on railroad sidings. If this were allowed farmers' elevators could come in direct competition with elevators now on railroads.

The bill to give the state council of defense power to seize foodstuffs in Wisconsin and sell them at a price to be fixed by the state was advanced. The bill is not likely to meet with much opposition when it comes up for final passage, as it has the backing of the administration and the finance committee.

Buy a Liberty Bond.

The farmer (and town man, too, as well) who wishes to show his loyalty and patriotism cannot do better just at present than to subscribe for a Liberty bond. These are the bonds which the United States government is issuing in order to raise $2,000,000,000 (to begin with) to carry on its share of the war against Germany. The bonds are to bear 3½ per cent interest and have every resource of the national government back of them, so that they are absolutely safe investments. They are to be issued in denominations of $50, $100, $500, $1,000, and so on, interest to be payable June 15th and December 15th of each year. If the government should, at any time during the war, issue bonds bearing a higher rate of interest than 3½ per cent, these Liberty bonds may be exchanged for the new bonds and the advantage of the higher interest rate thus be taken.

The national government needs money for war purposes, needs it badly and needs it at once. A large percentage of this $2,000,000,000 bond issue is to be loaned to the European nations which are our allies in the war against Germany. Practically all of this money will be spent here in the United States, largely for foodstuffs and clothing. Hardly any of it will go abroad. The Liberty bond issue is, therefore, releasing for general circulation a vast sum which would otherwise be kept out of general circulation—that is, much of it. Good times can hardly fail to result from this action. The farmer will prosper by the bond issue. He should be a large customer for the bonds.

The Wisconsin Farmer urges upon every patriotic farmer that he investigate this issue of Liberty bonds, consult his local banker and loan his surplus funds to Uncle Sam, who is fighting our battles for us and giving to us all a prosperity and security the like of which we have never known before.

Freight Costs on Wisconsin Potatoes.

The Wisconsin Farmer is in receipt of the following communication:

In your issue of March 22d I noticed an interesting cartoon entitled "Where Producer and Consumer Both Lose." The drawing showed on one side a farmer receiving $1.25 a bushel for his potatoes and at the other end the consumer paying $3.75 a bushel. In between were three very corpulent figures representing the commission merchant, the railroads, and the wholesale dealer. The inference naturally to be drawn from this picture is that these three interests divide the amount of $2.50, which represents the difference between the price paid by the consumer and the price received by the producer.

It may be that the cartoon is entirely accurate and that the commission merchant, the railroads and the wholesale dealer do in fact receive this amount. I have not looked into the question of profits of the commission merchant or the wholesale handler of potatoes, but I have been interested in looking up the rates received by the railroads on potato shipments and I wish to suggest that in the interests of accuracy the figure representing the railroads should have been not more than one-tenth the size of the figure representing the producer, which would have made it of microscopic proportions in comparison to the size in which it was actually drawn.

I suppose that Chicago is the principal market for potatoes grown in Wisconsin. I find that the rates per 100 pounds from various Wisconsin points to Chicago are as follows:

From	Rates in cents per 100 pounds
Waupaca	13.5
Green Bay	12.5
Wausau	13.5
Prentice	19.0
Chippewa Falls	14.5
Stevens Point	13.5

As you will see by the above the rate from Green Bay to Chicago figures out 7½ cents a bushel, while the rate from Prentice, which is the highest of the points named, amounts to about 12½ cents a bushel. If the consumer in Chicago is paying $3.75 a bushel for potatoes shipped from Wisconsin, the railroads receive from 2 to a little more than 3 per cent of this amount. It hardly seems to me that this is an excessive ratio for the service they are called upon to perform.

If these Wisconsin potatoes were to continue their journey to New York, they would pay an average rate of 31½ cents a hundred pounds or approximately 19 cents a bushel; so that even in such a case the freight charge would be a relatively small proportion of the total price.

The idea conveyed by your cartoon has been presented to the public so repeatedly that it has resulted in a very exaggerated idea as to the part played by transportation charges in the cost of living, when as a matter of fact if you will look into the rates charged on most articles of ordinary use, you will find that the transportation charge is a negligible factor in the final cost. I realize, of course, that you did not publish the cartoon with any desire to create an impression unfair to the transportation lines, but I thought that you might be interested in seeing these figures just as I have been interested in looking them up and for that reason I am taking the liberty of calling them to your attention.

E. W. MAYO.

Mr. Mayo's statement is interesting and we are glad to give it space. It is not difficult for us to remember back to the time when the producer was getting 20 to 30 cents a bushel for good potatoes in Wisconsin, and if this producer happened to reside near Prentice it cost half what the potatoes brought per bushel to get them on to Chicago. Of course, railroad rates look very small just now in comparison with the high prices of farm products. At the time Wisconsin growers were getting 25 or 30 cents a bushel for good table stock, such stock was selling at retail in Chicago in many grocery stores at 80 cents to $1 per bushel. Figured on the basis of 80 cents a bushel the railroads got a fair slice of the cost of potatoes to the consumer. We are not prepared to say, however, that they got any more than they actually earned. But under normal conditions, and with the normal prices for Wisconsin potatoes (we refer to what the grower gets) the railroad figure for a cartoon would scarcely be so small that it could not be seen. The price of potatoes is viewed from two standpoints—that of the money the grower gets out of the stock and the cost to the man who uses the potatoes for food. There is a wider difference between these two prices, many believe, than is necessary. Much of this is, however, chargeable to the expensive systems of distribution, including deliveries and store credits. However, it is not easy to convince the grower that he gets absolutely a square deal when he sells nice, clean potatoes for 25 or 30 cents a bushel, and these same potatoes bring 80 cents a bushel in Milwaukee and $1 a bushel in Chicago. The Wisconsin Farmer, however, in the interest of fairness to the railroads, is glad to publish the figures on potato tariffs given by Mr. Mayo.

Intensifying Farm Work.

The increase in Wisconsin's production of food is not likely to be accomplished so much by increasing acreage of any one or all of the food crops as it is by better farming of the usual number of acres. The following paragraph seems to express the situation:

Here is one point I think we do not consider as we should, and that is that a man who is so disposed can intensify his operations on his farm to almost an unlimited extent. If you will keep, we will say, twenty cows on forty acres of land, that does not mean that you cannot keep right on and increase the number, and in doing so you get more fertility into the soil and raise bigger crops and more nutritious crops because you do grow bigger crops, and so you can keep right on growing more feed and keeping more cows. If any of us are ambitious to be big farmers, I believe there is a much better way of going about it than to get more land. It is not alone better for the individual, it is better also for the community. Roads and schools could be made much better and be had for less taxes in a community of small farms than in a community of large farms. Besides, there are numberless ways in which the farmers of a thickly settled neighborhood can operate to their mutual profit and advantage that are not practical in a locality where each farmer owns 160 or more acres of land.—Edw. Nordman, chairman of the Agricultural Committee of the State Council of Defense.

By the time another year rolls around Wisconsin will be able to increase the acreage of crops along many lines. There will be some increase, of course, this year, but it may not be so large as many will expect. No one suggests that we should plow up any considerable amount of our meadows and pastures in order to get grain. One of Wisconsin's chief responsibilities at this time is to increase the production of dairy products which are essential to feeding the world the same as grains and meats are essential. Butter and cheese have a great deal of food value. They will go a long ways toward sustaining our people.

Not More But Better Horses.

In the following communication Mr. Wayne Dinsmore, secretary of the Percheron Society of America, gives some facts and figures relating to the horse and mule situation in the United States:

The actual exports of horses during the thirty months ending March 1, 1917, amounted to 853,116 head of horses, valued at $182,994.406, and 289,062 mules, valued at $58,051,914. These figures are the most accurate that it is possible to obtain anywhere, as they are the figures given out officially by the department of commerce and labor and cover all exports from the United States to all countries. The great bulk of these have gone for war purposes, although there have been a few exports to northwestern Canada for farm use.

It has not been possible to obtain from any source whatever the number of horses sent out from this country by states.

The department of agriculture estimates for January 1, 1917, credited the United States with little over 21,000,000 horses and a fraction over 4,500,000 mules. The census for 1910 gave us 1,731,000 head of horses and mules foaled in 1909. This was taken April 15, 1910, so that we had about a million and three-quarters of yearling horses and mules.

In spite of the slackening in horse breeding in the last seven years, the best informed authorities are agreed that we are producing at least one and a half million horses and mules annually which come to yearling age, and the mortality thereafter is slight. We do not need an increase in mere number of horses. We do need an increase in specific kinds, to wit, heavy draft horses and good thick farm chunks of draft type, weighing from 1,300 to 1,600 pounds. Aside from these two sorts which are salable and of real value, we do not need an increase in any other kinds except first-class saddle horses, and these cost so much to produce and sell so low that there is no inducement whatever to the average farmer to raise them.

We would like to emphasize what Secretary Dinsmore says in regard to the kind of horses that we should produce in the future, namely, heavy draft horses and good, thick farm chunks weighing from 1,300 to 1,600 pounds.

Wisconsin Farm Boys in 1861.

Madison Veteran Gives Interesting Reminiscences of Civil War Days in Connection With Memorial Day Annual for Schools.

THE Wisconsin Memorial Day Annual, compiled by O. S. Rice, supervisor of school libraries, in collaboration with H. W. Rood, patriotic instructor of the Grand Army of the Republic for Wisconsin, has recently been issued. It is a splendid book, giving valuable information for the pupils of the public schools and suggestions for programs. One of the most interesting articles in the book is that by Mr. Rood, entitled, "Patriotism in the Civil War." Mr. Rood recalls the part which Wisconsin took in that noble conflict. The young men of Wisconsin began to enlist immediately after President Lincoln made the first call for 75,000 volunteers. There were in the cities of Wisconsin at that time about twenty organized militia companies. None of them had the required number of men. Boys from the farm were among those most anxious to join the volunteers. Mr. Rood says:

I knew three farm boys, John, Edgar and Henry, who thus enlisted in the First Wisconsin Infantry for three months. When they came home that night and it was told around the neighborhood what they had done, they became at once in our estimation three young heroes. After serving out their term of three months, all became officers in later regiments. So it was with hundreds of Wisconsin farm boys.

A comrade of my own company told me that while he was in school, on the 23d day of September, 1861, the boys and girls were somewhat excited by the sound of a fife and drum on the street. At recess time he, with others, ran—as all boys are still apt to do—down to hear the music and see what it was all about. When the bell rang to call them back to school, Charley was an enlisted soldier. He was the first boy in our company to be hit with a confederate bullet, and was so wounded that he had to be discharged. Hundreds of thousands of our soldier boys came into the army directly from the schoolroom. I can myself name many of them. The recruiting officer robbed the teacher of nearly all of the big boys.

It is a fact that the average age of our soldiers at enlistment was less than nineteen years. Not nearly half of them were yet nineteen years old. Some boys got into the service at thirteen—thousands of them when only fourteen or fifteen or sixteen years old made the very best of soldiers. They were likely to be healthier than the older men, for they could the more easily adapt themselves to all sorts of conditions of army life. They were generally more cheerful and hopeful than those who had dependent families at home. Such boys made army life a kind of play spell. They got all the fun out of it they could, and they found ever so much of it.

General Arthur McArthur entered the army as adjutant of the 24th Wisconsin Infantry when he was only seventeen years old. He came home at twenty as colonel of his regiment.

Now and then when a captain needed more men for his company he would arrange for a "war meeting" at a neighboring schoolhouse. Some neighbors would volunteer to take their teams and convey loads of the enlisted boys out to this meeting. The fife and drum and flag were in the wagon in front, and there was lively music all the way out and much other noise. Having arrived, there was some lively martial music, and then a patriotic speech. My captain was gifted with a sturdy eloquence, and on such an occasion was sure to arrive at a lofty degree of oratory. We boys would cheer him with all our might, and so, take it all together, we could make a great stir among the country people at the meeting. Then when the speech was done and there was more music, we were pretty apt to get one or more new names on our company roll.

During the civil war there were camps for military instruction in, or near, Madison, Milwaukee, Racine, Fond du Lac, Oshkosh, Ripon, Janesville, La Crosse and Prairie du Chien. The chief camp was that known as Camp Randall, near Madison. Mr. Rood says that most of the boys at Camp Randall lived in circular tents, about twenty in a tent. They slept upon straw and rolled up in blankets, all with their feet pointing to the center. When there were twenty in a tent they were packed in pretty close, as Mr. Rood says, "spoon fashion." At sunrise the drum corps beat a reveille, which meant for everyone to get out for roll call. Those who did not get out in time to answer to their names would be punished by having to do extra duty. As Mr. Rood remarks, some boys at home nowadays need some such system to get them out of bed in the morning. After roll call the boys washed up for breakfast and then to give them a good appetite went through a half hour of company drill, much of it on the "double quick." Then came breakfast, with about 2,300 eating at one time on long tables in a large room. Mr. Rood says the food was good. At half-past eight came the guard mount. Then the non-commission officers, sergeants and corporals were put on drill for an hour. Then came the hour of company drill until dinner time. At two o'clock there was battalion or regimental drill. At five o'clock came dress parade, and on pleasant afternoons there was a large crowd from the city to witness this sight. Quoting again from Mr. Rood's article:

At sunset the band came to the foot of the flag staff to play "retreat." This consisted of three or four pieces of their best music, and there would be an acre of us boys sitting on the ground round about to enjoy the concert. As the last tune of the last piece died away, boom! went the nearby cannon, when Old Glory came fluttering down to be carefully folded and taken in for the night. Then we all went to our tents, when we told stories, sang songs and spent a pleasant evening. Sometimes we went calling on the boys in other tents. At nine o'clock the drums beat "tattoo," which called us to fall in for evening roll call. Half an hour later a single drummer beat "taps," which meant that all lights must be out and no talking. I sometimes wish that our young people now might be brought to lead the regular life we lived in camp. They would in many ways be the better for it.

About once a week we had to go on guard. A line of guards paced back and forth all the time just inside the high board fence around the camp. If we wished to go down town we had first to get a pass. If caught out without a pass we were liable to be arrested and shut up in the guardhouse.

Mr. Rood goes on to describe the days in the field and on the march.

The Wisconsin Farmer has been previously indebted to Mr. Rood for many interesting facts which have been given in articles which have appeared in this paper with reference to the activities of Wisconsin regiments during the civil war.

Applying Fertilizers and Lime.

Ordinary Broadcast Methods Will Not Give Satisfactory Results —Drill and Cultivator Attachments Most Practicable.

—By J. W. Henceroth.

SINCE efficiency and success with the use of fertilizers depends very largely on the methods of application, let us see how they are being applied—and discuss the relative merits of the different methods. Some men spread them broadcast on top of the ground after the seed bed is prepared. Unless the fertilizers are thoroughly worked into the soil, broadcasting will not give the best results, as the fertilizers do not get down into the area where there is available moisture to dissolve the plant food, so that the tiny plant roots can pick it up. Some farmers apply fertilizers on top of the ground and plow them under, like manure. Ordinarily, this is not best, as the fertilizers are applied too deep. In using fertilizers and manure, one thing should be kept in mind, namely, that all plants absorb their plant food through their root hairs, and most of these are on the smallest roots. The largest percentage of roots and root hairs are in the second, third and fourth inches of soil. For this reason the fertilizer, and manure as well, should be placed in that part of the seed bed where there is the greatest moisture and bacterial action.

FERTILIZER BOXES ON CULTIVATOR.

The fertilizer attachment of whatever drill or planter is being used offers the best means of properly doing the work. It is not practical to apply fertilizers through drills or planters without fertilizer attachments. Some men endeavor to sow the fertilizer through the grain box, but this is seldom very satisfactory. Grain and seed compartments of most drills do not have force feeds that will drill the fertilizer regularly while the fertilizer compartments do have such force feeds. All grain drills, corn planters, potato planters, seed drills, etc., are made with attachments by means of which fertilizers ma[illegible] in the soil or in the rows at the time of planting. The fertilizer attachments for the different machines may be used for other special purposes than those for which the drill was specifically intended. For instance, the fertilizer attachment of the grain drill may be used for applying fertilizer on all ground put to corn, potatoes and garden crops before the particular crop in question is planted. The lime and fertilizer distributor is indispensable to the proper application of lime, and for top-dressing wheat and grass with fertilizer, it is without a rival.

It often happens that a person does not have the best tool for the application of fertilizer on particular crops. In this case some other tool may be substituted. For example, on corn, potatoes and all truck crops, all the fertilizer may be applied through the fertilizer attachment of the grain drill before the crop is put in. A potato planter with a fertilizer attachment may be used for marking out the land and applying the fertilizer in the rows for such transplanted crops as tomatoes, cabbage, celery, etc. A fertilizer attachment may now be purchased for most cultivators, for side-dressing rowed crops at the same time that the crop is being cultivated.

Practically all applications on all crops are best made by regular machinery, though fertilizers may be scattered by hand if necessary. When top-dressing by hand on rowed crops, or spreading fertilizer in rows before planting, a fertilizer funnel or "bugle" is a great back-saver and places the fertilizer just where needed without loss from wind. This handy device is like an ordinary funnel, but has a spout two inches in diameter and long enough to make it forty-two inches long over all. The fertilizer is carried in a bag slung over the shoulder. One hand guides the fertilizer into the funnel, while the other guides it along the row.

Anyone wishing to use fertilizer, but who does not have a fertilizer attachment for the drill, can apply the fertilizer broadcast through any one of the broadcasters that should happen to be available, and thoroughly disk it or harrow it into the soil. The fertilizer "bugle" may be used.

In many cases it is possible to buy a fertilizer attachment for the drill already on hand. It is not too late, if fertilizers were not used when the crop was put out, to use them as a top or side dressing when cultivating the crops. Anyone wishing to use fertilizers can secure a fertilizer attachment for his cultivator. No extra lime is required except what is needed to fill the box. The fertilizer is applied and cultivated into the soil, where the growing crop will make immediate use of it.

Careful directions are furnished with all machines, telling exactly how to regulate them to sow various amounts of fertilizer. Fertilizers are so manufactured in the modern fertilizer factory that they are ground, screened, mixed and cured for several months. Finally, when the shipping season arrives, they are taken out, reground, screened, bagged, and shipped immediately to the farmer, so that it comes to him in good, mechanical, drillable condition. If care is taken to see that the fertilizers do not get wet after arriving, there is usually little trouble experienced in their application. It is always advisable, when getting the machinery ready to drill any crop, to jack it up, throw both fertilizer and seed hoppers in gear, turn the wheels a certain number of revolutions and see that the desired amount of both grain and fertilizer is applied.

It is impossible to secure a 100-bushel crop of corn from a 60 per cent stand. On the other hand, it is entirely a waste of money to allow high-priced seed to "run through like water." The same thing applies to fertilizers. One thing should always be remembered in using fertilizers, and that is not to get too much close to the plant or in the hill. For instance, it is better to allow the fertilizer, even when applied in the row on corn, to run continuously and not drop it in the hill, even if the corn is hilled. Dropping too much fertilizer in the hill causes the corn roots to remain in one place. When dry weather comes the corn roots bunch and do not go out through the soil in search of water and plant food. For this reason it is better to apply two-thirds of the fertilizer on corn broadcast through the fertilizer attachment of a grain drill and the other third continuously down the row when the corn is planted. It is seldom advisable to apply more than 125 or 150 pounds to the acre in the corn row. Up to 600 or 800 pounds of fertilizer may be applied in the row to potatoes. All amounts above these should be applied broadcast before the crop is put in. Finally, all fertilizers should be cleaned out of the machine at the end of the season, in order that it may be in good working condition when the next seeding time arrives.

FERTILIZERS ON PLANTER.

Everyone using fertilizers should leave a test strip, and at harvest time should measure and weigh the crop from an equal area of fertilized and unfertilized land to see how well the particular analysis suits your land and crops. Fertilizers contain three plant foods likely to be deficient on most soils, viz.: Ammonia, which gives plants a quick start, a deep green color and promotes stalk growth; phosphoric acid, which increases the yield of all grains, hastens maturity and improves quality; and potash, which strengthens straw and plumps grains. Each farmer should study his crops and buy such an analysis of fertilizer as will supply the plant food most needed by his particular crop on his farm.

St. Paul

In and Around Wisconsin

County Agent C. P. West, Sawyer county, recently bought a carload of fine grade Holstein cows and heifers at Black River Falls. This stock was shipped to Seeley. Mr. West found considerable difficulty in getting hold of good stock, owing to the big demand on the part of buyers from outside states.

J. W. Brann, field inspector for the State Seed Potato Service, has volunteered as special agent for Waushara county. Mr. Brann will devote his energies toward improving the potato crop. Reports from Wautoma indicate an increased acreage. Mr. Brann expects also to interest a number of farmers in putting out beans and soy beans.

E. R. Jones, secretary of the drainage association and drainage engineer for the college of agriculture, has been secured for emergency agent in Dodge county. It is expected that Mr. Jones will be able to reclaim a number of acres and to put many farms in better condition by means of surface drainage operations, including emergency plowing and shallow ditching.

ON ANTON SAVERDA'S PLACE, SOUTHERN JACKSON COUNTY, WIS.

D. H. Otis, who has had charge of the farm management work at the college of agriculture for several seasons, has been engaged as emergency field man for Jefferson county. Mr. R. V. Gunn, of the experiment station staff, has been assigned to Fond du Lac county. Henry Lunz, another experiment station worker, has volunteer for the same work in Columbia county.

Owners on a number of farms in Christiana township, Dane county, have organized the Christiana Soil Improvement Club with seventeen members. The club will coöperate in the purchase of limestone pulverizer and fifteen of the members will proportion the cost of same. They will also purchase a carload of phosphate fertilizer. Farmers in any community of the state who are interested in forming soil improvement clubs can get full particulars by writing to W. J. Geib, care of the experiment station, Madison, Wisconsin.

TWO ENGLISH SHIRE COLTS, THREE MONTHS OLD, TAKEN ON ANTON SEVERDA'S FARM, JACKSON COUNTY, WISCONSIN.

Mr. A. H. Karnahan, Black River Falls, an officer of the American Society of Equity, undertook to supply farmers with seed for sorghum and found the job a bigger one than he could handle and was obliged to come to Madison to get an extra supply. The seed for planting an acre for sorghum is very inexpensive. Mr. Karnahan says that he bought some of the seed at 12 cents a quart and not to exceed two quarts plant an acre. He recommends that the seed be planted eighteen inches apart in rows with three-foot space between. The seed from sorghum is valuable as a poultry feed.

The first issue of the Journal of Soil Improvement has come to the editor of The Wisconsin Farmer. This publication is to be issued by members of the soil department of the Wisconsin Experiment Association. The paper is the official organ of the Wisconsin Soil Improvement Association. W. J. Geib is editor-in-chief. Associate editors are H. W. Ullsperger, W. W. Weir and L. P. Hanson.

The Wisconsin Highway Commission has estimated that 1,245 miles of road will be constructed in the state this year and that 350 bridges will be built. This work is to be done under state aid and is separate from the trunk line work which is to be done by state and federal aid. The estimated expenditure for road construction alone is $3,700,000. The bridges will cost about $540,000 additional. In addition to this there will be county aid bridge work which will total over $500,000.

Wisconsin boys and girls who are interested in getting into poultry may secure a copy of the circular, "Start a Flock," by writing to the Wisconsin College of Agriculture, Madison, Wisconsin.

The Wisconsin Department of Agriculture has taken up the matter of selling beans for seed. The price announced May 17th was $10.50 per bushel, in whole sacks and $11 in parts of sacks. Previous to the May 1st quotation the department had sold two carloads at $10 a bushel.

The saving of fat, feed and fuel was the object of the first of a series of distinct war conferences of Wisconsin creamery operators and managers held at the commercial club at La Crosse recently.

About thirty different creameries in the La Crosse region were represented at the meeting, which was called by G. H. Benkendorf, of the dairy school, University of Wisconsin, and secretary of the State Buttermakers' Association.

Under the head of "fat economy," which has been found to play such an important role in the welfare of the central powers of Europe, the Wisconsin buttermakers discussed such points as the frequent delivery of well-cared-for cream during the summer, and the steps which must be taken at the factory to reduce the enormous annual losses from moldy butter.

Skim milk, now worth 75 cents a hundred pounds, instead of 30 cents as in the past, must be carefully economized, the discussion brought out. By skimming a thicker cream, having a higher fat content, more skim milk is left for the live stock on the farm.

Ways of adjusting the steam fittings and boilers of a creamery, in order to make use of every ounce of fuel energy, was also talked. The importance of thorough control of the moisture and salt in butter was another topic of interest.

"We hope to make these conferences of great patriotic service," declared G. H. Benkendorf, chairman, in his opening address. "You are helping your community directly, because one point learned may be the means of saving your creamery and its farmer-patrons a large amount of money, time and labor. Other meetings will be held at central places in the state at different times this season."

Representatives of creameries from the following towns were included in the conferences: La Crosse, Stoddard, Viroqua, Sparta, Westby, Cassville, Roadstown, Patch Grove, Arcadia, Bangor, Holmen, Bagley, West Salem, Melvina, Pigeon Falls, Ettrick, Galesville, Coon Valley, Leon, Prairie du Chien, Blair, Oakdale, Warrens, Mt. Tabor, DeSoto, Kendall, Mindoro and Waumandee.

The Wisconsin Department of Agriculture has taken up the matter of selling beans for seed. The price announced May 17th was $10,50 per bushel, in whole sacks, and $11 in parts of sacks. Previous to the May 1st quotation the department has sold two carloads at $10 a bushel.

In Sheboygan County.

To the Editor:—I recently made a forty-mile trip through the northern part of Sheboygan county, May 2d. I found in many cases that seeding had hardly been started, due to the wet, cold weather. Near Cleveland, Wisconsin, seeding had been finished a week, but farther west it will take until the middle of May. Nowhere were pastures beginning to brighten up, so that farmers must figure on three more weeks of barn feeding.

One of the most serious conditions I found was the absolute scarcity of spring pigs. The extremely cold winter was hard on brood sows, so that litters were small and weak, many pigs being born dead or dying soon. Early spring pigs, six to eight weeks old, are selling at $6.50 to $8 each, and are a scarce article at that. Late litters will relieve this shortage somewhat.

We have just received a letter from Prof. A. C. Osterhuis, Wisconsin College of Agriculture, telling us of the safe arrival of our registered Guernsey bull at the experiment station. He writes: "We have already made good use of him. Professor Humphrey and Mr. Markey are both well pleased with his type."

This bull, that we have loaned to the department of animal husbandry, was our senior herd sire, Raymond of Wayland 20339. His dam is Fillmore 26864, A. R. 1857 reëntry. She produced 521 pounds of fat with first calf, and at five years, eight months, 696 pounds of fat in 10,953 pounds of milk. She is a daughter of Charmante's Rose King 11746, A. R., that has eight A. R. daughters. Among these are (1) Gold Dust's Elite, 29776, with a reëntry of 15,619 pounds of milk, 871 pounds fat (2,058.5 pounds fat in three years); (2) King's Alberta 33788 with 785.6 pounds fat at four and one-half years old as her third yearly record; (3) Fillmore's Happy New Year 34495 with a reëntry of 690 pounds fat.

Raymond of Wayland, on his sire's side, is a grandson of Imp. Raymond of the Preel 11353, that has fifteen A. R. daughters. M. J. Hoppert.

Sheboygan Co., Wisconsin.

Wisconsin Rural Carriers.

Wisconsin rural letter carriers will meet May 30th and May 31st in their annual association meeting at Sturgeon Bay, Door county. Just as June is ready to be ushered in the Door county country looks its best and we have no doubt the rural carriers will enjoy every hour of their meeting at Sturgeon Bay. The officers of the association are president, A. D. Larson, of Sheridan; vice president, T. T. Pyburn, of Marshall; secretary, E. L. Demarest, Waupaca; treasurer, G. C. Granger, of Sheboygan Falls; organizer, Henry Gallenback, Beaver Dam.

CURRENT EVENTS

HOME rule for Ireland is nearer today than ever before, one of the results of the European war. Last week the British premier, Lloyd George, sent a letter to John Redmond, leader of the Irish nationalist party, outlining the government's project for the settlement of this vexatious question, which has given England more trouble than almost any other problem. The government, the letter set forth, has been desirous of effecting an immediate settlement which will concede the largest possible measure of home rule that can be secured by agreement at this moment, without prejudice to the undertaking by parliament of a further and final settlement of the most disputed questions after the war. The government's proposals provide for the introduction of a bill for the immediate application of the home rule act to Ireland, but excluding the six counties of northeast Ulster, such exclusion to be subject to reconsideration by parliament at the end of five years; a council of Ireland, to be composed of two delegations, representing the excluded area as well as the new Irish parliament; consideration of the bill after its second reading by a special conference under the chairmanship of some one commanding general confidence. As an alternative, it is suggested by the premier that a convention of Irishmen of all parties be assembled for the purpose of arranging a scheme of Irish self-government. It is known that the need of Irish home rule has been impressed upon the British commission, now in the United States, by prominent Americans and perhaps the entrance of this country into the war may prove to be one of the determining factors in giving the people of Ireland the self-government they have long been denied.

ONE of the big, tangible results of the European war has been to hasten the progress of prohibition in many of the nations engaged in the titanic struggle. That the United States may find a similar result coming from its participation in the war now seems probable. The first legislative step toward a dry nation and the conservation of our food supply was taken last week when the United States senate, by a vote of thirty-eight to thirty-two, passed a bill prohibiting the use, during the war and for one year afterwards, of cereals or grain in the manufacture of intoxicating liquors. The prohibition clause, as introduced by Senator Cummins, of Iowa, reads as follows: "That on and after September 1, 1917, during the period of the war with the imperial German government, it shall be unlawful to use or employ, directly or indirectly, any cereal, grain, sugar or sirup in the production of intoxicating liquor in any form or of any kind; provided that nothing in this section shall prevent the use of sugar or sirup in the manufacture of wines as now authorized by existing law; provided further, that this section shall not be construed to make unlawful the manufacture of alcohol or intoxicating liquor for industrial, mechanical, medicinal, sacramental or scientific purposes under rules and regulations to be established by the secretary of the treasury. A violation of this section shall be punished by a fine of not more than $5,000 or imprisonment for not more than three years or both."

A SQUADRON of American torpedo boat destroyers has safely crossed the Atlantic ocean and is assisting British craft in patroling European waters. The American navy's actual entry into the war zone has already been productive of a brush between a destroyer and a German submarine, with what results has not yet been made public. After the news was given out in London of the arrival of the American vessels, Secretary Daniels, of the navy department, issued a public statement in which he said: "United States naval vessels have been operating with the allied naval forces in European waters since May 4th. A number of destroyers sailed from American ports in the latter part of April, and all arrived at their destination without accident or delay of any kind. They were ready for operations when they arrived and went into service immediately. It has been the purpose of the United States navy to give the largest measure of assistance to the other countries at war with Germany that is consistent with the full and complete protection of our own coasts and territorial waters." The navy has thus become our first line of defense and offense, leaving the army to follow later on.

BROAD presidential authority over transportation, including power to determine what commodities shall be given preference in the movement of freight, was asked of congress by President Wilson with the plea that "the exercise of much authority has become imperatively necessary." In submitting a resolution authorizing him to exercise these powers for the duration of the war, or to delegate them to a transportation commissioner, the president wrote the house judiciary and commerce committees that while the railroads had shown a patriotic spirit, creation of some central authority should be authorized at once to guide in determining the priority of shipments. As a result a bill was introduced, giving the president authority to stipulate what commodities shall have preference in movement of freight. One provision added to the preferential shipments section would make it a misdemeanor, punishable by a fine of $10,000 and five years imprisonment, for any carrier or its employes to fail to comply promptly with the preferential shipment order. Another would give the interstate commerce commission authority to fix a just compensation for any extraordinary service rendered by a carrier in complying with such an order.

FINAL action was taken by congress Friday of last week on the war army bill and it has already been signed by President Wilson and become a law. This bill provides for the conscription of men between the ages of twenty-one and thirty, exempting the physically unfit, those with dependents and men who are needed on the farms and in other industries. The bill, as finally passed authorizes the president to raise volunteer forces, which Colonel Roosevelt desires to lead to France, but does not make it obligatory upon him to do this. It also raises the pay of practically all classes of soldiers. The bill, backed by the administration, was introduced in the senate April 19th, was passed April 28th in the senate by a vote of eighty-one to eight, and in the house, 397 to twenty-four, and since has been tied up in conference, returned there twice by the house to include the Roosevelt volunteer provision and further pay increases for enlisted men. Its chief provisions are: Raising of armed forces by the selective draft system, imposed upon all males between the ages of twenty-one and thirty years, inclusive, subject to registration and certain exemptions from service. Increasing the regular army to maximum war strength. Drafting into the federal service of national guard units. Raising of an initial force by conscription of 500,000 men, with addition of 500,000 if deemed necessary. Raising, if the president sees fit, of four divisions of volunteer infantry (the Roosevelt amendment). Increasing the pay of all enlisted men.

THE problem of the high cost of living can be solved by increasing the cultivation of the tillable land of the country through the taxation of unimproved land and untaxing improvements and other products of labor, according to a brief filed with the federal trade commission by the committee on the high cost of living. The brief urges the commission to recommend that some such action be taken by the legislatures of twenty-eight states, which possess a total farm acreage of 430,815,650 acres, it is stated, with only 250,875,588 acres improved. In all other states, the brief states, the change should be made possible by constitutional amendments.

FOUR HUNDRED THOUSAND pounds of Montana wool were sold in Chicago one day last week for 52 cents a pound, the highest price in the history of the western wool industry. The purchaser was the Union Mill Company, of Boston, and the trade was consummated in New York. This deal came on the heels of information that hardly enough wool exists to fill government contracts—including blankets, socks and underwear for the army. Talk of the substitute of cotton has forced that staple upward in the last few days until 25 cents a pound is predicted for October cotton.

GREAT BRITAIN has received a third installment of $25,000,000 of the $100,000,000 which the United States has agreed to lend to meet British purchases in this country during May. It is understood Great Britain is purchasing supplies on behalf of Russia in this country.

THE unsettled state of governmental affairs in Russia is causing the anti-German allies much concern. The new government is not holding the reins with the tight hands which are needed. The laboring element in Russia is extremely dissatisfied and the soldiers are taking practically no part in the European war just at present, enabling the Germans to withdraw soldiers from the Russian front and use them to strengthen the lines against the British and French. Notwithstanding this condition, the United States made an initial loan of $100,000,000 to Russia last week and is sending a commission, headed by Senator Elihu Root, of New York, to Russia, to arrange for the coöperation of the two governments in the further conduct of the war. Russia remains an uncertain factor, with almost anything possible there in the near future.

KING EIGHT
60 HORSE POWER

You "make hay" when you buy a King

IT is an automobile sufficiently reliable under severe official road tests to have its chassis adopted by the United States Government for armored cars, though it shares this honor with several other good makes of cars, some of higher price.

Its four bodies were designed for unusual grace of line and elegance of finish, and one of them may appeal to you as being more beautiful than any other car among the many attractive models now on the market.

The King is built by a long-established company with a reputation for good cars and fair dealing, ranking high among a number of worthy competitors.

It is a car which may be conservatively described as economical, considering its high power and bigness, and one that "handles" easily,—its all-round road competence, especially on hills, has surprised and delighted many.

In all, we believe the King Eight does offer a quite remarkable combination of power, economy, reliability, comfort and style, which, considered with the price, makes it a purchase absolutely safe for anybody and one thoroughly consistent with our slogan "The Car of No Regrets."

Foursome (shown above), $1700; 7-passenger Touring model, $1650; Sedan, $2300; Roadster, $1585. Prices F. O. B. Detroit and subject to increase at any time. A catalog in color will be sent on request together with the name of a near-by King dealer.

KING MOTOR CAR COMPANY, DETROIT, MICHIGAN

Will Put Up His Third Silo.

Ed G. Race, of Omro Farms, Winnebago County, Sees the Importance of Increasing Silage for the Benefit of His Herds.

ED G. RACE, of Omro, farms each year 400 acres. Most of the farm's output goes to the dairy herd in the form of silage and grain and hay. Silage is the basis for live stock feeding, in the estimation of Mr. Race. Over 100 Holstein cattle, pure bred and grade, have convinced him of the wisdom of depending on silage.

BARN ON THE ED G. RACE PLACE, OMRO, WISCONSIN.

The first silo on Mr. Race's place was erected some seven years ago. The second soon followed and a third will be put up this year to prevent possible shortage next season when the herd will be enlarged. Looking back to the years when silage was unknown to Wisconsin farmers Mr. Race remarked that he was still wondering how they ever got along without this useful form of feed. It is impossible for him to get along without silage now. He has had to do so for a period of a few months during the past summers when his silage gave out, but the trouble experienced even in this short time in the feeding of proper rations for dairy production emphasized the need of another silo for reserve.

In proof of his statement as to the value of silage Mr. Race points with pride to his present herd sire, a Holstein bull which up to six weeks ago had not received any silage in his ration. Mr. Race claims that the bull since he was brought on the place has made the most wonderful gain on his ration of corn silage, alfalfa and a little grain that he has ever witnessed. The animal today shows up smooth and sleek, while prior to this silage ration he was in very poor condition.

SIX WEEKS SILAGE AND ALFALFA ADDED 100 POUNDS TO THIS BULL'S WEIGHT AND MADE HIM SMOOTH AND STRAIGHT.

About 100 acres of the farm are devoted to clover and alfalfa and the rest planted to corn, oats, barley, sugar beets and spring wheat. Mr. Race figures that cows make full use of the pasture for four weeks only and at the end of that time the addition of silage is absolutely necessary in order to insure continued large yields of milk. He never pastures the clover during the first year, but allows a stubble of six to eight inches of the nurse crop in order to give the field every opportunity to hold the snow in the winter and prevent freezing out. Results so far have always shown this method to give excellent stands the following year. This year's stand is another proof of the success of the practice.

NOW ADDING ANOTHER SILO TO THESE TWO.

To accommodate any future enlargements in this herd Mr. Race built a barn several years ago which he figured would take care of the increase of a lifetime. The barn is 50x120, giving room for twelve rows of box stalls on one side and two rows of stanchions with a wide alleyway on the other. The loft above holds 300 tons of straw and hay. This is enough to supply the demand for the herd for the entire year. Another barn 70x86 feet is for horses and young stock. Both barns have a stone basement and are well lighted.

Mr. Race has been farming twelve years, beginning like thousands of other Wisconsin dairymen with the stock left them by their fathers, just ordinary cows. Not long after, however, the first Holstein bull was purchased, followed shortly after by a further investment in the form of two pure-bred Holstein cows. The results of the influence of the sire gave so much promise that the herd has been continually added to and improved since that day. Most of the stock is home bred, and, though there are a considerable number of grades still in the herd, they are decidedly high class. One grade Holstein produced in one month's time 1,735 pounds of milk, testing 3.2 after being on test for a considerable period. She was the best in the testing association for March.

Senator Johanna White, out of a 31.07-pound cow, Johanna Piebe White, with yearly record of 1,146.78 pounds of butter and 26,497.6 pounds of milk.

Mr. Race is president of the Fox River Valley Holstein Breeders' Association. No better year has ever been experienced by the farmers of the Fox river valley than the season just passed. Though the prices for feed were high, butter fat also brought good prices and cattle were in especially heavy demand. The sales from this district were particularly large, the biggest shipment of the season being made on April 2d, when 300 animals started from Appleton for Texas. As fast as the stock is available buyers from all over the country eagerly snatch them up at good prices. R. J. Schaefer, formerly president of the Fox River Valley Breeders' Association, has been acting as agent for all surplus stock in the county. No better man could be found to direct buyers, according to Mr. Race, for no animal for sale goes begging very long before a buyer is found if Mr. Schaefer knows about it. One of the purposes of the breeders' associations is to aid in disposing of surplus stock, but during the last year the trouble has not been to dispose of stock, but to supply the demand.

Senator Johanna White, senior herd sire on the farm for four years and with excellent heifers to testify to his ability to reproduce, was recently sold by Mr. Race for $1,200.

DELEGATION OF TEXANS VISITED FOX RIVER VALLEY RECENTLY TO BUY DAIRY CATTLE.

GET THIS TRACTOR

For medium sized farms. Not only prepares the ground for crops, but does your harvesting, road grading, silo filling, threshing and other belt work. A combined tractor and power engine of the famous Eagle two-cylinder type, with large belt pulleys. Every part made in our own factory, representing the best in farm motor and tractor building. Operates perfectly on kerosene as well as gasoline.

Three Sizes: 8-16 H. P., 12-22 H. P., 16-30 H. P.

Sold under an absolute guarantee. For further facts write for our catalogue today.

Calamus Holstein Association.

To the Editor:—Our Calamus Holstein-Friesian Association was established four years ago when there were no pure breds in this section. Now we have about fifty, and two-thirds of them are bulls heading the different herds. At our last meeting Mr. J. R. Wheeler, of Columbus, gave a fine report of the year's work of the cow-testing association at Columbus, proving to us that cow-testing brings big returns. Our new officers for the coming year are: President, William Haase, Beaver Dam; vice president, Joseph R. Rake, Columbus; secretary, E. A. Schiller, Beaver Dam; treasurer, D. Hughes, Columbus; director, F. Bilke, Beaver Dam.

E. A. Schiller, Sec.

Handling Seed Potatoes.

WISCONSIN'S yearly potato output, according to the latest crop reports, is from 25,000,000 to 36,000,000 bushels. With favorable weather conditions the indications are that this amount will be somewhat greater in 1917 because of the high prices prevailing during the past year and the strenuous efforts made by numerous agencies throughout the state for increasing this year's acreage of potatoes. Normally Wisconsin devotes about 300,000 acres to this crop each year.

A very timely bulletin on potato growing in Wisconsin by J. G. Milward has just been released by the agricultural experiment station. It deals with every phase of potato growing from planting to marketing and is worthy of close study by every farmer of the state that is planning on a potato crop this year.

TYPES OF WHOLE AND CUT SEED.

Seed cut in blocky pieces like Nos. 3, 4, 6, and 8 is preferred. Small to medium-sized tubers from healthy fields are satisfactory. No. 5 shows damage from shriveling and sprouting and should not be used.

The planting season for northern counties ranges from May 20th to June 1st for the late varieties. Early varieties for the southern seed trade may be planted as late as June 20th. Mr. Milward does not consider of value the practice of seeding late varieties later than the dates mentioned in order to avoid bugs.

Treatment for seed by the corrosive sublimate method or with formalin for scab and scurf should be done from three to four weeks before planting date. The treatments cannot safely be made if the sprouting has started. With the corrosive sublimate four ounces to thirty gallons of water is the proper proportion. The seed should be soaked one and one-half hours. The formalin treatment consists of soaking seed for two hours in solution of one pint of formalin to thirty gallons of water. The seed stock should be kept under moderate light and temperature condition after treatment to encourage sprouting before the tubers are cut. Within two weeks after treatment active sprouting will begin under proper conditions and by the time the planting is to be done the dead and weak seed can be sorted out. Strong, sound tubers will show evidence of growth.

The proper method of cutting seed tubers is shown in the picture. Blocky seed pieces are preferable. Each tuber has a bud end or seed end on which are located the quickest and strongest growing eyes. The proper method advised by Mr. Milward is to cut the tubers so that this end is divided. Smaller sized tubers can be cut in halves, cutting lengthwise. A strong early growth necessitates a good-sized piece of seed tuber. Whole seed can also be used whenever the tubers are known to come from clean, healthy fields. Seed plots can be planted late to insure a large percentage of small to medium-sized tubers. Planting culls from loading stations is a poor practice, because a large percentage of small seed may be due to disease, weak vines or unfavorable conditions. Seed tubers should not be cut too long before planting, as they are often damaged by long exposure to the sun or other unfavorable conditions. When delay occurs the cut seed should be housed under cool, dry conditions.

Under average conditions with seed twelve to sixteen inches apart in the row and rows thirty inches to three feet apart, ten to twelve bushels of potatoes are all that is necessary to plant an acre of potaoes.

Machine planters which drill the seed from four to six inches deep are in common use where the acreage is large. Where only a few acres are planted hand planters are commonly used and do excellent work. One man can plant from one-half to two acres a day where land is well marked, fitted, the seed cut and delivered to him on the field.

Commercial fertilizers are not as commonly used in Wisconsin as in the eastern states. Much work is to be done on this in the future. Planter attachments are available for applying fertilizer. On small areas fertilizer can be spread over the row and dragged in just before the potatoes come up.

Cultivation should begin before the crop can be seen. A spike-tooth harrow can be run over the fields to kill young weeds. As soon as the rows appear cultivation must take place to prevent weeds from gaining a foothold. As the season advances cultivation should become more shallow in order to prevent cutting of the tubers with the heavy shovel cultivators.

MACHINE PLANTER WITH SINGLE OPERATOR.

On the sandy soil growers claim spring plowing to be better for fitting the land. Plowing is postponed to the latest possible date preceding planting time, as these growers maintain a better seed bed can be prepared under favorable weather conditions. On a heavier soil fall plowing is preferred. Mr. Milward, however, emphasizes that intensive fitting, providing a good seed bed, is of more importance than the question of fall or spring plowing.

Potatoes easily wear out the soil if grown oftener than every third year on the same land. Green manuring and barnyard manure prevent this. Poor drainage causes disease of the vines and rotting of the seed tuber at the time of planting or of the crop prior to harvest.

For Home Grinding Limestone.

Farmers remote from the railroad or from a satisfactory lime supply will doubtless find it more economical to grind their own limestone where a good rack is available. Various companies are now putting small portable limestone grinders on the market. The cost of these grinders depends principally upon their size, but it can be said in general that those suitable for the use of individual farmers, or of groups of farmers coöperating in grinding stone will cost from $500 to $1,400. Such grinders have a capacity of from one to five tons an hour, depending upon the size of the machine, the kind and dryness of the rock, and the fineness of grinding. They require engines varying from eight to twenty-five horse power. Smaller sizes are on the market, but they have a correspondingly lessened capacity. A fair size for community work is a machine having a capacity of around two or three tons an hour, costing 750 to $1,000 and requiring an eighteen to twenty horse-power engine. A somewhat larger machine will often be more advantageous where many farmers are coöperating and where a large acreage is to be limed.

In selecting a grinder, care should be taken to see that it will handle pieces of stone at least four inches in thickness. Some grinders will not handle rock that has not first been crushed by another machine or broken by hand. The best of these large-sized portable machines will take, in stone measuring, five to seven inches thick and eight to twelve inches wide.—M. F. Miller, Missouri station.

Foxtail millet, which makes up approximately nine-tenths of all the millet grown in the United States, is declared by specialists in the United States Department of Agriculture to be valuable chiefly as a catch crop. The plant is adapted to a wide range of soils and climates. Although large yields are not obtained under favorable circumstances, millet does better on poor soil and in a dry climate than most other hay crops. Compared with Sudan grass, its chief competitor, millet is deficient both in quality and yield of hay, but the growing season of the Sudan grass is somewhat longer, and this provides greater opportunity in the latter for injury from drouth. In its feeding value the hay of foxtail millet has been found to be approximately the same as timothy hay.

Giving the Calves a Chance.

Dairy calves are deserving such care as will enable them to become better cows than their mothers have been. The young calf requires care and attention if this is to be accomplished. A stunted calf cannot mature at as early an age as one well fed from the start and she can never become as large an animal and it is more than probable that her production will never reach the point in quantity or profit unless she is fed reasonably well from the start.

During the first season there are many temptations to slight the calf. Grass sometimes becomes short, farm pigs make demand for the skim milk and the farm help becomes too busy to look after the youngster as to watering and protecting from flies. All these things are to be guarded against with as simple and satisfactory arrangements as possible.

For grass to be short need no longer be a handicap, because silage may be used in place of it. Calves like silage and do well when it is fed liberally. Should silage not be available, alfalfa, oats or any other green crop may be cut and fed in the green state to very good advantage. Skim milk may be reduced and even removed entirely if grain and other feeds are plentiful. However, it is probable that with good, well-bred calves it will give as good returns as when fed to pigs. Calves must have water and no arrangement is satisfactory unless a supply is provided to which they may run at will. Lack of water is one of the chief causes of unthriftiness in calves and since water can be so cheaply and easily provided it is always well to do so. No one knows better than a dairyman how necessary it is to protect against flies and no one knows better how much damage may be done by the little pests. Clean feeding places, clean yards and clean surroundings are the sure preventives of fly troubles.

Each calf deserves protection against its pasture mates if it is to do its best. An inexpensive row of stanchions in which all calves may be fastened at feeding time will insure that the small calf will get the milk or grain measured out to him just as surely as will the larger one. Such small stanchions prevent absolutely the larger ones crowding the smaller ones from the trough. To leave the calves in the stanchions for a few minutes after milk is fed will cause the youngsters to lose their desire to suck each others' ears, which is a very annoying habit and which may result harmfully. Care and thoughtful attention always reveal different ways or means by which the thrift of the youngsters may be increased and the progressive man or boy will invariably give his calves that extra care and attention. The old Scottish adage, "The eyes of the master fatten his stock," has a thousand applications and not the least among them is in calf feeding.

Efficient Feeding of Dairy Cows.

Dairymen are seeking the greatest production possible with the least amount and the cheapest feed with which it may be produced. In doing this they are considering the individual cow more and more. Formerly each cow was fed a measured amount of feed regardless of whether or not she was a heavy or a light producer. In this day of high-priced feed and close figuring and thinking it has occurred that there might be a close relationship between the amount of milk produced and the amount of feed required to maintain that production. Accordingly, men have set about to determine the correct proportion of feed. Experience showed that a cow giving milk rich in fat required a heavier feeding of grain than one giving milk low in butter fat. Also the character of the roughage made a difference. Silage containing a generous quantity of corn naturally cuts down the amount of concentrates. A cow thin in condition or one carrying a calf might well be fed a little extra.

However, a very satisfactory proportion has been determined which, when fed with care and judgment, has given very satisfactory results. The rule, if it may be called a rule, is to feed one pound of grain for each three to four and one-half pounds of milk that the cow is producing daily. This insures that the heavy producer shall have her just proportion and it provides that the low producer or the one far advanced in lactation shall not be fed any more than she deserves. This is an economical and a practical way of feeding.

Hundreds of dairymen have proven the value of this method of feeding. Experiment stations have tried it and colleges have advocated this as the correct practice in feeding. On one of Iowa's best dairy farms, notable for its good cows and its successful management, the feed is measured out for each cow before the feeding hour. A sheet showing the production of each cow for the preceding day hangs in the feed room and each cow is fed in exact proportion as shown upon that record. One of Iowa's progressive farmers has shown the merits of this plan. He had kept records when he fed in the old-fashioned hit-or-miss method. Now he has one year's record obtained under the new method. He gives his results as having decreased the cost of feeding. He also increased the production and, best of all, the profit was increased 200 per cent. Certainly this method of feeding which, according to every line of reasoning, is correct and which upon an ordinary dairy farm has demonstrated its value by increasing profit so markedly, is worthy of universal adoption.

System on Dairy Farm.

System and organization are two great watchwords in successful dairy management. They enable work to be done more quickly, more thoroughly and more surely, and with less expenditure of money and effort. They have transformed many a farm from a place of hurry and bustle for many long hours to a place smooth in its running and organized in every effort wherever required labor is performed at a specific time and in a definite manner. System and organization are just as important on a dairy farm as they are in any other business. They constitute main lines that are necessary if the greatest success is to be secured.

At the head of the list in systematic management stands the plan of the day's work. This is really the backbone of the dairy business. We may have land and barns and cows and a splendid market, yet without hard every-day labor they would be as naught. A systematic plan enables a man or set of men to accomplish more in a day. A place for everything and everything in its place, a time for everything and everything at that time constitute a very good motto under which work may be planned and executed. A regular routine of milking, feeding and cleaning the barn saves steps and time and adds to the effi-

PREVENT DEATH AMONG CALVES

Caffatone—the Dairyman's preventative and remedy for scours, positively stops scours in calves and colts inside of 3 hours without binding. Caffatone is harmless—given to weak and delicate animals. Many calves are born with scours. Protect yourself now—have Caffatone on hand—often there is no time to get Caffatone after scours is discovered although we send immediately by parcel post. Caffatone keeps indefinitely—packed in gelatine capsules—15 tablets to box together with full directions. Results are guaranteed—Caffatone given widest endorsement by many users. Money back guarantee card accompanies all orders—tear out advertisement, use name of druggist—Pin $1.00 bill to letter. Protect your calves by mailing order today.
CAFFATONE REMEDY CO.
02 E. Main St., Platteville, Wis.

Flies rob farmers of over $90,000,000.
You are losing money every day you neglect spraying your stock with SHOO FLY. Guaranteed to KEEP OFF flies and many other insects. Aids in healing sores, allaying itching and preventing infection. Excellent for galls, also lice and mites in poultry houses. Used and endorsed since 1885. Costs less than ½c per animal per day.
Shoo-Fly
$1 TRIAL OFFER If your dealer can't supply you we'll send enough to protect 6 cows 30 days, also 3-tube sprayer. Name exp. office. Special terms to agents.

COWS GIVE 1/3 MORE MILK WHEN NOT DISTURBED BY FLIES

ciency and to the profit. Under a system well planned no part of the work is likely to be neglected or forgotten as often happens where there is no plan or organization.

Judgment and reason constitute the best guide in revising the work of the dairy and farm. Many of the most prominent and successful dairymen prefer to do the milking in the morning before the feeding is done or before the stalls are cleaned. Under this method the cows are more quiet and there is less dust than if the grain and hay had been fed before milking. Furthermore, the possibility of the odor of silage or other succulent feed getting into the milk is entirely prevented. For the same reason there will usually be less dust and cont mination if the litter is not disturbed until after the milking has been done.

System has its place in herd improvement. The greatest breeders and improvers of live stock have planned their work and have everlastingly followed methods which they had carefully outlined. Persistent use of the Babcock tester is necessary if a dairyman is to determine with accuracy which cows are to be retained in the herd and if he is to determine which cows are most desirable as breeders. Systematic work in this will eliminate the unprofitable cows and will enable a man to retain only the ones that are profitable. Herds have doubled their production as a result of testing for a few years. In one community production was increased 100 pounds of butterfat per year by the application of the results secured through a cow-testing association.

In feeding operations splendid results are secured from systematic practices. The most carefully planned farms are carrying more cows for a given area than are the farms where there is no regular plan followed. By careful planning a man is enabled to have a perfect balance of everything.

Rice Lake-Cedar Lake Association

To the Editor:—In March there were 670 cows under test in our association of which twenty-three produced more than forty pounds of fat, eleven produced more than fifty pounds, four produced over sixty pounds and one produced 88.75 pounds. A registered Guernsey owned by F. D. Stout, of Long Pine Farm, produced 1,742.2 pounds of milk and 88.75 pounds of butter fat. The high-grade cow was also a Guernsey owned by Stout's Cedarlake Farm. She produced 1,144.6 pounds of milk of 5.9 of test, making 67.5 pounds of butter fat. The March forty-five-pound list is as follows:

Owner, name and breed	Age	When fresh	Pounds milk	Percent of fat	Pounds B. fat

Westby Association.

To the Editor:—The Westby Cow-Testing Association had thirty-five cows on its list which produced forty pounds of butter fat or 850 pounds milk for the month of March. Many of the farmers ran short of feed the latter part of the month. Following is the forty-five-pound list for the month:

Owner and breed	Age	When fresh	Lbs. milk	Lbs. B. fat
Melvin Staplien				
Gr. Guern.....	3	2-28-17	968	46.5

Reg. Jersey...	4	2-27-17	1010	47.5

Ross N. Root, Tester.

Geneva Association.

To the Editor:—My experience with feed shortage the past winter has been quite extended. A number of members of the Geneva Cow-Testing Association bought feed last July to last them, but some of them did not buy quite enough and a few of them did not buy at all. Some of our members did not feel that they could afford to feed grain at the present high prices, and consequently the profits of some of our members is small. I bought six carloads last July, but have not made any purchases since. We got two cars of bran, two of oil meal and one each of brewers' grain and middlings. Those who have realized that it is necessary to feed have since been buying anything they could get hold of. Feed prices change so that I am not personally very favorably impressed with prepared rations. We cannot always tell by what we get in one shipment what we are going to get in the next batch. The following is our forty-five-pound list for the month ending March 31st:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat

Finds Cream Separator Profitable

Letter From J. W. Barclay, Wamego, Kansas.

When four cream separators all of the same make are sold in a family it is pretty good evidence that this kind of a machine is giving satisfaction, is built from the best kind of material and designed right and sold at the right price. Here is what Mr. Barclay says:

"Dear Sirs:—I received the No. 9 Galloway Sanitary separator a week ago today. Everything in good condition except the tank has two small dents in it, but they are so small it would not pay to return it at all. I like the machine just fine so far.

"I have good reason to know why the Galloway separator is all right, this being the fourth machine in the Barclay family, so you see I knew just what I was doing when I ordered a machine from you.

"If I had ordered my machine a little sooner and had got the coöperation cards, as I already have now, then I might have sold one of your machines to a neighbor of mine. He went to a dealer and purchased a 750 lb. capacity called (Mr. Barclay mentions high-priced machine not widely advertised) and paid $85 for it.

"Well I guess I have told you enough for once, so I will close.

Your friend, J. W. Barclay."

The manufacturer of this fine separator, William Galloway, Waterloo, Iowa, president of the William Galloway Company, will be glad to send you one of his 1917 books about cream separators if you will drop him a postal card asking for it and mentioning this paper. He builds the Galloway sanitary cream separator in his own chain of factories at Waterloo and sells them direct from factory to farm at one small profit. That is why so many of his customers say they saved from $25 to $50 and sometimes even more in buying a high-class cream separator.

Has self-centering bowl; detached spindle

Every De Laval equipped with Bell Speed-Indicator

NEW DE LAVAL
CREAM SEPARATOR

THESE are the days when you are getting *more milk in the pail,* and with butter-fat at its present high price you want to be dead sure that you are getting *all the cream out of the pail.*

You certainly can't afford to feed butter-fat to the calves and pigs at from 30 to 40 cents a pound.

All sorts of *"claims"* are made for various cream separators, but what you are looking for is *"proof."*

Here is the most convincing kind of proof that the De Laval is the cleanest skimming machine:

Fifteen years ago there were a dozen different makes of creamery or factory separators in use.

Today the creamerymen and large milk plants the world over use the De Laval almost exclusively. In fact, it's hard to find a large cream producer or creameryman who will allow any separator other than a De Laval in his plant, no matter what the price.

Why? Because they have found that it makes a difference of several thousand dollars a year to them whether a De Laval or some other make of machine is used. They simply can't afford to use any other machine.

This is proof of De Laval closer skimming that you can't afford to ignore. Even if you don't separate as much cream as the creameryman, you can't afford to waste it any more than he can.

Your local De Laval agent will be glad to let you try out a New De Laval on your own place. If you don't know the local agent, write to our nearest office for catalog or other information.

Weather Continues Favorable.

Farm Work Well Advanced, but Crops Growing Slowly—Pastures Are Short—Prospect for Fruit Is Favorable.

MINNESOTA.

Brown County.—Last week was dry and the farmers were able to finish seeding. Early potatoes and gardens are planted, but the weather continues cool with frosts every night. Pastures are bare and a number of farmers are out of feed. Considerable baled hay has been shipped out of this county and it is selling at $16 a ton. If the weather is favorable a larger acreage of corn and potatoes will be put in this year than last. Considerable building is under way; many silos are being put up and a number of farms are being remodeled. Labor is very scarce.—S. J. Shannon.

Crawford County.—Weather has been very cold and crops are not growing well. Oats and other spring grains are up. Rye looks fairly well, but seems to be shooting up rather straight and not stooling as it should. Meadows and pastures look well, but are late. However, some farmers already have cattle on pasture. Vegetables are coming up and fruit trees are beginning to shoot leaves. Strawberries are beginning to bud. The hay crop is about normal. Everybody seems to bear in mind that it is their duty to raise as large crops as possible.—H. H. Stuckey.

Door County.—Farmers are practically through seeding oats, peas and barley. The season is backward. Farmers are trying to increase the acreage of grain. The acreage of corn and beans will be increased as much as possible. Prospects for fruit are very good, especially for cherries. Fruit growers are applying the lime sulphur spray at this time.—L. E. Birmingham.

Douglas County.—This section needs rain badly. Pastures are slow and there will be an increase in the acreage of small grain and potatoes. Because of the cold spring not much corn has been planted. The county has agreed to guarantee the expenditure of $5,000 to buy seed for farmers who are not able to buy their own. Everyone seems awake to the present crisis and with true American spirit are trying to do their share.—B. N. Stone.

Dunn County.—Small grains are coming up. Wheat and rye look fine. Pastures are fair, but late. Potatoes and corn are being planted, but because of scarcity of feed, the potato acreage will not be as large as usual. Hay crops look well, but are still short We have had a long dry spell, but there has been no serious damage so far. Cattle still show the effects of winter; colts are making a good record. Pigs are fine.—James A. Smith.

Florence County.—The farmers are just beginning to do their seeding. Very little winter wheat was raised in this part of the county. Farmers are putting in oats and barley mostly. Farmers are figuring on raising a lot of potatoes this year if the weather permits. The season is very backward. Pasture is short.—Phil Kelmes.

Iowa County.—The season is ten days late. Heavy frosts at night and cold raw winds in the daytime have delayed vegetation. Some grain is up. Pastures are far below normal, but a rain with warmer weather following it would put them in good shape. The hog crop is about 90 per cent normal since a number of small pigs were lost on account of cold weather. Cattle are in fine shape and the milk flow is good. Iowa county has increased the acreage of wheat about 200 per cent, while other grains, potatoes, and gardens show an increase of at least 10 per cent over the general average.—Art. G. Hoskins.

Jackson County.—Grain crops, clover and meadows are in good condition, but need rain and warmer weather. Most of the live stock have been turned out to pasture, but they are getting short picking. It is too cold for meadows to grow very much. The corn and small grain area will be greater in our section this year than last and the increase estimated is about 15 or 20 per cent.—C. S. Ristow.

Juneau County.—Weather is cold and dry. However, some small grain has drowned out in the low places. Farmers are getting ready for corn and potatoes, but because of the cold weather they are slow in planting. Pastures and meadows are making slow progress on account of the weather. Most of the stock have been turned out on pasture. Hay is very short. The pig crop looks rather light.—O. W. Hale.

Lafayette County.—Small grains are at a standstill because of cold weather. Pastures are poor. Farmers are short of dry feed and have turned cattle on to the new seeding to give the pastures a chance. Some ground has been planted, but considerable plowing is yet to be done and several farmers are waiting for warmer weather. The acreage of small grain and corn will be about normal. About the usual number of live stock are being saved except that there will be fewer calves. The high price of provisions and scarcity of foodstuffs are causing an increased number of gardens this year. Because of the scarcity of help it is impossible for the farmers to increase their acreage much.—W. F. Pease.

Langlade County.—Weather is still cold, but most of seeding has been done. More spring wheat was sown than usual. The acreage of potatoes will not be greater than normal because seed is very hard to get. Many farmers are planning on plowing up old pasture and putting in rutabagas. The season was very cold for young stock and what is saved is below normal. Live stock are still eating dry feed. Pastures have not turned green yet.—Chas. Parsons.

Marquette County.—Weather is dry and windy with slight frosts nearly every night. Rye wintered fine, but has made very little growth lately and it is not stooling on account of dry weather. Rain is needed. Oats are backward. Clover and timothy have a fine stand, but no growth yet. Wild pasture is short and hay very scarce and high priced. Calves and lambs are doing unusually well, but brood sows are not doing well and the percentage of pigs is small. Live stock are healthy. Cows are scarce and there is not much young stock. Everyone is trying to put in as large a crop as possible, but help is very scarce. The potato acreage will be about as usual. Corn ground is nearly ready for planting; some farmers have planted already.—J. M. Williams.

Oneida County.—Dry weather last week enabled the farmers to make rapid progress with seeding, which is now practically completed. Most farmers are sowing from one to four acres of wheat and some barley and buckwheat are being sown besides the usual acreage of oats. Farmers are getting their potato ground in shape. As much corn will be planted as it is possible to care for. Warm rain is needed to bring up the pastures. Live stock are on dry feed but look well. Farmers are planning to plant a large area of vegetables. The clover seeding came through the winter in fine shape Butter fat is worth 40 cents; milk, 8 cents a quart; eggs, 30 cents a dozen, and hay, from $13 to $17 a ton.—F. S. Campbell.

Pierce County.—Weather has been cold and dry with only a few warm days. Pastures are short. Clover and rye are good. Fruit blossoms have not started yet, so they will probably be free from frost. Spring grain is growing slowly. Corn planting is about half done. Hay is scarce and selling at about $18 a ton. The farmer can always be depended upon to do his full share towards feeding the world and he will be equal to the task this year if the weather conditions are favorable. He will keep right on working sixteen hours a day. He never was known to go on a strike, no matter what the hours or the pay, and there is no need to fear that he will quit now.—G. K. Moore.

Price County.—Season is late, cool, and dry. The seeding of small grain has commenced. Meadows are in fair condition, but need warmer weather and rain. Pastures are short. Live stock are in fair condition. The percentage of young stock saved is about normal. There will be an increase in the acreage of potatoes. Some forest fires have started up within the last few days.—C. F. Glisendorf.

Rock County.—Weather is still cool and dry. Grain is very backward. Meadows look good, but are slow. Small grain is coming up nicely. The ground is too cool to plant corn. Potato planting is progressing, but the scarcity of seed is keeping down the acreage. Seed is selling at from $2.50 to $4 a bushel. Cattle are thin because of the extremely hard winter and backward spring. Horses came through the spring work in good shape.—P. F. Amery.

Rusk County.—Spring is backward and seeding is progressing slowly. Although some farmers have turned stock out to pasture, the grass is still short and backward. The new seeding looks very well and very little of it winter-killed. Cattle are in average condition for this time of year, but the hard winter and high price of feed show their effect on some herds. From all indications a large acreage of potatoes will be planted.—T. M. Thomas.

Taylor County.—Rye and clover came through the winter in good shape, but are not making much headway on account of cold weather. A warm rain is needed badly. Seeding of small grains is nearly done and the acreage will be about the same as last year. People in this vicinity will plant more potatoes than usual if they can secure the seed. Seed potatoes are worth from $2.50 to $3 a bushel. Live stock are rather thin on account of the shortage of hay. Not many cattle are being sold except calves and they are being picked up in this vicinity by buyers for the Chicago market. Hogs are scarce and pigs are selling at from $12 to $15 a pair. It is reported that a farmer west of Medford lost about eighteen head of cattle on account of tuberculosis.—J. C. Hoffman.

Washburn County.—Spring is backward and nights are cold. Vegetation has made little growth. Oats have been sown and some are coming up. Farmers are plowing for corn and potatoes. The ground is in excellent condition, but rain is needed. Winter rye is thin in some cases because it was frozen out. The acreage of spring wheat has been increased this year. Hay and grain are scarce and high in price. The percentage of spring pigs saved is below average. Many new settlers are coming into the county and improving wild land.—L. D. Garnhart.

Washington County.—Clover and fall grains came through the winter in good shape. Some of the early seeding is backward. The stand is missing on about one-third of the wet places. The weather has been too cool up to the present, which makes meadows very poor. About half of the late potatoes are planted. There is no corn in this section. Most of the live stock wintered well, but many farmers are now getting short of feed. Farmers in this vicinity are trying to produce the largest amount of foodstuffs possible. Fully a third more spring wheat was sown this year than usual.—M. P. Salter.

Wood County.—Weather is dry and crops are growing slowly. Rye looks fine. Farmers are planting corn. Pastures and meadows are very backward. Apple trees are beginning to bloom. All live stock are doing well and their number is about normal. A case of contagious abortion has been reported recently. Corn and small grain will be normal. The farmers are planting as many potatoes as possible.—Fred E. Weber.

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her **FREE Homestead lands of 160 acres each** or secure some of the low priced lands in **Manitoba, Saskatchewan and Alberta.** This year **wheat is higher** but **Canadian land just as cheap,** so the opportunity is more attractive than ever. Canada wants you to help **feed the world** by tilling some of her fertile soil **—land similar to that** which during many years **has averaged 20 to 45 bushels of wheat to the acre.** Think of the **money you can make** with wheat **at over $2 a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed farming** in Western Canada is as **profitable an industry as grain growing.**

The Government this year is asking farmers to put increased acreage into grain. There is now a great demand for farm laborers to replace the many young men who have volunteered for service in the war. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or to

123 Second St., Milwaukee, Wis.
Canadian Government Agent.

Upper Wisconsin.

How to Handle Soy Beans.

Soy beans may be planted from one to two or even three weeks after corn planting. Prof. R. A. Moore and Prof. E. J. Delwiche in their exhaustive bulletin on the subject of soy beans say that good crops of hay can be grown from planting as late as June 15th to July 1st. Soy beans are valuable as a legume crop for the light, sandy soils of Wisconsin, especially the Jack Pine lands and the scrub oak plains. On account of its resistance to drouth and heat the soy bean may be grown on soils and in seasons in which clover might fail. In 1910 soy beans planted on freshly broken lands at the Spooner branch station, June 8th, gave a yield per acre of 2,500 pounds of hay of the Ito San variety and 1,600 pounds of hay of the Early Brown variety. In another experiment at the Crivitz station Early Black soy beans produced a ton and a half of hay on newly broken Jack Pine land. In addition there was 15.5 bushels of seed per acre. Soy beans may be grown profitably for seed in sections of the state where there is a long growing season. To secure the best results on ground where soy beans have not been grown the soil should be inoculated with the proper bacteria. Professor Moore says:

From experiments conducted throughout the state it has been found that when soy beans are grown on land for the first time, unless the seed or soil has been properly inoculated with nitrogen-fixing bacteria, few if any nodules wll develop on the roots. There seems to be a limited number of bacteria in the soil, however, and if soy beans are grown a second year on the same field a few plants will be found with nodules on the roots. The third year the bacteria will have increased to such an extent and be so well distributed throughout the field that nodules will develop plentifully and without artificial inoculation. On rich soils no difference has been shown between inoculated and uninoculated plots. It is evident, however, that even though the plants grown on uninoculated soils may be vigorous, they do not secure the nitrogen from the air, thus enriching the soil, but draw it from the soil, just as do non-leguminous crops, such as corn, oats, etc. On poor, sandy soil inoculation produces the better crop.

Several cultures for inoculating soy bean seed, previous to seeding, are on the market. Experiments carried on at the station during the past ten years show that soil inoculation is more certain in its results than the use of commercial cultures. If the grower desires to try such cultures, they may be obtained free of charge from the United States Department of Agriculture, Washington, D. C.

The best results have been secured when bacteria-laden soil was used for inoculation. It may be distributed by various methods. The seed may be merely dampened and mixed with the soy bean soil, and the mixture sown with a drill. A sack of soil is sufficient to inoculate two acres or more of land. A better method is to distribute at the time of planting, the inoculated soil in the rows as the soy beans are planted. This is done by means of a fertilizer attachment on the drill. Provided much inoculated soil is available, results can be hastened by broadcasting from 500 to 1,000 pounds of the soil per acre.

It should be remembered that sunlight kills the legume bacteria. The soil for inoculation, therefore, should not be exposed to bright sunlight, and if it is broadcasted on the field, it should be harrowed in immediately, and a cloudy day or early morning should be chosen for the operation.

The ground for soy beans should be prepared in the same manner as for corn or other cultivated crops. The soy bean, like other crops, responds to barnyard manure, but the addition of manure is not so essential, since the plant is able to get its nitrogen largely from the air. The clay lands should be plowed in the fall and in the spring disked, harrowed and made smooth by the drag and planker. For light, sandy soils spring plowing is preferable. If the soil is loose, it is advisable to compact with the roller. On clay and sandy loam soils both spring and fall plowing are equally satisfactory.

Soy beans may be planted with drills, the ordinary garden drill being sufficient for the small patch. For the large fields use the machine drill. One-third to a half bushel of seed per acre is required. When planted in drills for hay one-half to two-thirds of a bushel should be used per acre. Place the rows eighteen to twenty-four inches apart. Plant one to two inches on heavy soils and somewhat deeper on lighter soils.

In Sawyer County.

To the Editor:—We expect to have plenty of help to operate the farms in this county this year, but there will not be any to spare to send outside. We will do a considerable amount of land clearing in this county this year. We are working hard on the food preparedness campaign and featuring the garden project among the town people and we will undoubtedly have an increased acreage of potatoes among the farmers of this county. C. P. West,
County Agent, Sawyer County.

WANTED CANADA LAND

WOULD like to correspond with parties who own good Canadian land, 320 acres or more, clear or nearly clear, to exchange for Iowa or Southern Minnesota corn belt farms.
WILLIAM GALLOWAY Waterloo, Iowa.

ARE YOU GOING TO BUY LAND?

IF so, get a copy of our journal first. It has lands, city property and stocks of goods advertised in its columns from nearly every state, so that you can find just what you're looking for in its columns. Established 19 years and reaches 76,200 readers. Send 25c for one year's subscription or $1.00 for five years. Department F. Farm and Real Estate Journal, Traer, Iowa.

OREGON & CALIFORNIA RAILROAD CO grant lands. Title to same revested in United States by act of Congress dated June 9, 1916. Two million three hundred thousand acres to be opened for homesteads and sale. Timber and agricultural lands. Containing some of best land left in United States. Now is the opportune time. Large sectional map showing lands and description of soil, climate, rainfall, elevations, etc. Postpaid one dollar. Grant Lands Locating Co., Box 610, Portland, Oregon.

A SMALL farm in California will make you more money with less work. You will live longer and better. Delightful climate. Rich soil. Low prices. Easy terms. Sure profits. Hospitable neighbors. Good roads, schools, churches. Write for our San Joaquin Valley illus. folders, free. C. L. Seagraves. Ind.Com'r, A.T.& S.F.Ry., 1959 Ry. Ex.,Chicago.

FARM WANTED. Wanted to hear from owner of farm or fruit ranch for sale. O. O. Mattson, 2954 Cedar Ave., Minneapolis, Minn.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Increasing Poultry Products in the United States.

The statement made at the recent agricultural conference at St. Louis that the poultry products of the United States could be doubled within a year means that if everybody in a position to help did their part 600 million dollars' worth of food would be added to our supply this year.

This includes both meat for the table and eggs. Very few farmers practice a systematic plan of disposing of their fowls after they have ceased to be productive, although it is well known that fowls of the heavier breeds, such as the Plymouth Rocks, cease to produce a profitable number of eggs at the end of their second laying year, and that this holds true of the lighter breeds, such as the Leghorns, at the end of their third laying year. Consequently, if efforts were made to dispose of all females when their best laying days were over a large quantity of poultry meat would be placed on the market. All poorly developed chickens should likewise be culled out and used as meat. This way of disposing of unprofitable fowls would allow the farmer to feed his grain to younger and more productive fowls.

Caponizing the cockerels that are not intended for breeding purposes will not only increase their size but will place a more desirable poultry meat on the market. Another practice that should be adopted more widely is that of fattening all chickens that are to be marketed before they leave the farm. This can be done easily by confining the birds for a week or ten days and feeding them a good fattening ration. They will come to market then in better condition and the farmer will receive a profit for their added weight.

The greater production of turkeys, ducks, geese and guineas, all of which can be profitably raised and a ready market found in most sections, would increase the supply of poultry meat considerably. The production of ducks especially should be emphasized at this time, because of the rapidity with which they grow. Ducks of most of the meat breeds, properly fed and managed, frequently weigh from five to six pounds at ten weeks of age. It is estimated by poultrymen making a specialty of growing ducks that the feed cost per pound of producing duck meat ranges from 8 cents to 12 cents, depending upon the current prices of grain and other feeds.

The number of marketable eggs can be increased by following a few practical suggestions. Among the most important of these are the production of the infertile egg after the breeding season is over, and the proper handling of eggs by the farmer before sending them to market. The infertile egg is obtained when all male birds are removed from the flock. This does not decrease the number of eggs produced, but it does increase greatly their keeping qualities. The production of the infertile egg and the proper handling and marketing of eggs by the producer would increase tremendously the number of marketable eggs each year by diminishing the quantity that are rendered unfit for food. An increased production of duck eggs is advisable where available markets are found.

The poultry house should be clean and sanitary and the fowls free from insect pests, thereby preventing disease and mortality. It is estimated that nearly $9,000,000 worth of poultry is lost each year through disease alone. Special attention should be given to the feeding and housing of laying fowls at seasons of the year when their natural source of food supply is cut off.

The maturity of fowls hatched late can be greatly increased if the mother hens are confined until the chicks are weaned. In this way feed that is furnished the chicks produces growth, instead of energy to follow the mother. Extra precautions should be taken in the late spring and early summer to keep the young birds free from lice and disease, both of which cause thousands to die every year. More general use of the incubator and brooder will increase considerably the output of chickens, and consequently the number of layers the following year.

The United States Department of Agriculture and the several state agricultural colleges will be glad to supply helpful information to anyone interested in raising poultry on a large or small scale.

Breed Them True in Color.

To the Editor:—I have been criticised to a certain extent for the way I expressed myself in my previous article, "Don'ts and Whys." Regardless of your criticism, I am still ready to argue the good of producing color improvements in all varieties of pure-bred poultry. What would you think of a pure-bred Duroc Jersey that had black or white spots, or a Chester White with red spots? You might say hogs are different. But that is a poor argument for a poultryman to make. If we can't breed pure-bred varieties true to standard colors we might just as well go back to the ever-setting, non-laying dunghills that are losing their popularity steadily.

Wise people are beginning to realize the difference between pure-bred stock and scrubs.

As I promised in my previous article to write on parti-colored breeds, I will do so now. First, I will write of the Silver Laced Wyandotte, supposed to be the oldest of Wyandottes. Don't breed from birds that are single combed, or from males that are extremely brassy on top or that have white under color—slate is right. The hackle and saddle should be of silver color, each feather having a distinct black center. Breast should be very well laced and free from frosting on tips of feathers. The tail should be black and not carried too high, the legs yellow and free from stubs. Earlobes should be red. The females should not be too dark, neck laced same as male, balance of body well laced throughout, legs and earlobes same as male.

The Golden Laced Wyandotte is the same as the Silver Laced except where the Silver have white or silver the Golden have a dark golden color. The type is the same as all other Wyandottes.

The Partridge Wyandotte is the beauty breed. Don't breed from males with white undercolor in hackle or saddle or from those that have white feathers in any section. Look out for purple barring on black feathers in wings and breast. Keep centers of feathers in males' back and neck a nice black edged all the way around with a rich cherry color. Breed females with mossy backs or irregular penciling to males that are very clearly laced in black. This is a great improvement. The legs should be yellow or dusky yellow. The earlobes should be red.

Partridge Rocks are the same as Wyandottes except that they are single combed, a little higher on legs and longer in the body.

Silver penciled varieties are the same as Partridge only silver where mahogany and cherry in Partridge. Keep undercolor slate and backs distinctly penciled.

In black varieties don't breed from birds with purple barring or slate colored. The rich greenish black is standard. They should be absolutely free from white, red or buff undercolor, always the darkest. Keep the flock uniform—you will profit by it.

Poultry Judge.

CHESTER WHITE PIGS.

CHESTER White fall pigs sired by W. B.'s Wonder now ready to ship. Wm. F. Belda, De Forest, Wisconsin.

FARM LANDS.

NORTH DAKOTA is essentially an agricultural state. In the past five years it ranked first in production of wheat twice, twice it was second and once third; always first in production of spring wheat; also flax, equaling production of all other states. Once it was first in barley, never below third; never below seventh in rye and oats. Has made great increase in corn and stock. You can still obtain home there without commission to us, while land is still cheap. Easy terms. Write AT ONCE, for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Building, Minneapolis, Minn.

TO HELP INCREASE the country's volume of grains and other food products I am offering to sell about 5,000 acres choice agricultural lands near the cities of Superior and Duluth in 40, 80 and 160-acre tracts at low prices and on five to ten years' time, without any payment whatever on principal for two years, to any one who will clear and cultivate a part of the land at once. For full particulars write to W. H. Webb, Superior, Wis.

640-ACRE FARM—"PAY AS YOU MAKE IT" NORTH DAKOTA SECTION, fenced, near market. Splendid for grain, alfalfa and stock. Strong demand for farm products; unusual opening. Will sell on "Half Earnings" plan, and help reliable farmers secure live stock loans. Only small cash payment required. HACKNEY LAND CREDIT CO., Hackney Bldg., St. Paul, Minn.

HARDWOOD cut-over land, silt loam, clay subsoil. Not sandy or gravelly. Close to towns. Good roads. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 9. North Western Lumber Company, Land Department, Stanley, Wis.

"AN EMPIRE OF HARDWOOD LAND"—We own 20,000 acres and four townsites, traversed by three railroads. Send for map. Wonderful opportunities for saw mills, box and woodworking factories. Free factory sites. Ask for information. UPPER WISCONSIN LAND CO., Ladysmith, Wis.

DON'T POSTPONE THAT TRIP to the cheap land districts of upper Wisconsin—it is important if you want some of the best cheap land in America. Write us for names of owners. Wisconsin Advancement Assn., 1590 First Nat. Bank Bldg., Milwaukee, Wis.

$300 CASH DOWN will handle this 40-acre stock farm, only 2½ miles town, 12 cleared, balance easily cleared; touches small lake, house, barn, chicken house, well. Price only $1,500. Terms. C. M. Melberg, Lewis, Polk county, Wisconsin.

LAND of clover, Rusk county, Wisconsin. Choice farms in rich, new dairy district, cleared and uncleared. Climate ideal. Rainfall abundant. Grasses luxuriant. Terms easy. Prices low. Folder free. Manning & Swaim, Ladysmith, Wisconsin.

UPPER WISCONSIN—40 to 80-acre tracts, well located; small buildings, clearings; $20-$30 acre. Terms, one-fourth down, balance easy. Wisconsin has no crop failures. R. J. Russell, La Crosse, Wis.

WISCONSIN—65 farms, 15,000 acres, wild land. Corn, dairy, clover belt. Counties: Barron, Polk. Easy terms. Lowest prices. List free. L. Rivard, Turtle Lake, Wis.

FOR SALE—Choice, well-located fruit ranches. Lake Shore drive, Berrien county. Address Schulz, St. Joseph, Mich.

IMPROVED FARMS, best of location, priced reasonable, easy terms. W. F. Ryan, New Richmond, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

LAND CLEARING.

EXPERT LAND CLEARING contractor, 15 years' experience; has four months open time, June to September. Contracts taken for tracts from 25 to 1,000 acres. Land cleared ready for plow, under guarantee of lowest cost. If you want your land cleared on business basis and at less expense than you could do it in any other way, write at once, giving full particulars. P. R. Cunningham, Mgr., Box 359, Escanaba, Mich.

SEEDS.

SEED POTATOES—Fancy Northern Minnesota rural stock, free from scab and rot, sound and firm, about 100 bushels. For sale by Leonard Frank Company, St. Paul, Minn.

GOLDEN GLOW SEED CORN, $3 per bu. Clark's Yellow Dent, $3.50 per bu. Ear or shelled. 98% germination. BURTON PECK, Spring Green, Wisconsin.

GOLDEN Glow seed corn, kiln dried, 98% germination; $3 per bu. Order from producer. Get descriptions. Riley Martiny & Son, Baraboo, Wis.

BLACK Hills alfalfa seed, $6.00 per bu. For sample send stamp to Brookside Farm, Buffalo Gap, So. Dak.

GOVERNMENT JOBS.

FARMERS wanted, $75 month; men and women; U. S. government jobs. War means hundreds vacancies. Common sense education sufficient. Write immediately for list positions now obtainable. Franklin Institute, Dept. C176, Rochester, N. Y.

THE HOME

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

Waste.

The women of the United States are being asked as a patriotic duty to avoid waste in their kitchens and to do their part toward conserving the food supply. They are being asked to use more whole wheat and more corn meal, to grow and can more vegetables and fruits than they have ever grown and canned before. The great majority are ready and willing to do this and Uncle Sam will find that the women are only too glad to do their share.

But do they all keep their eye on that conscienceless waster, the garbage pail? He is forever on hand, ready to receive the slice of bread that has become dry, the glass of milk or bit of meat or potato or butter that has been left from dinner, and the amount of food it takes to support that garbage pail is astounding.

There are 20,000,000 homes in this country of ours. Let us count the waste of those 20,000,000 home garbage pails. Suppose into each one of those pails just for one day went one good-sized slice of bread. That slice of bread contains about three-fourths of an ounce of flour, which makes for the 20,000,000 homes a total of over 14,000,000 ounces of flour—over 875,000 pounds, or enough flour for over a million one-pound loaves of bread a day—365,000,000 loaves in a year.

Suppose the cook in each of these 20,000,000 homes allows only half a cup of milk to go to waste for one day. What would that mean? It would mean 2,500,000 quarts of milk a day thrown in the garbage pail, and in a year it would mean a waste of 912,500,000 quarts—the product of more than 400,000 cows.

Again, suppose that each household wastes for a day only one ounce of edible meat or fat. That means a daily waste of 1,250,000 pounds of animal food. A year of such waste would mean the loss of 456,000,000 pounds of valuable animal food.

And butter? One quarter of an ounce a day scraped off into the garbage pail in each of these 20,000,000 homes would mean the loss of 312,500 pounds. In a year it would mean a loss of 114,062,500 pounds.

Of course, this amount of food may not be wasted in all these homes every day, but even if we count one small slice of bread a week, one-half cup of milk, one ounce of meat or butter a week for each home, still the waste is appalling. The world is short of food, prices in our own country are high and millions across the seas are hungry. The government is asking the women to help and here is their chance. What could be done with a million loaves of bread, 2,500,000 quarts of milk, 1,250,000 pounds of meat and 312,500 pounds of butter in one day? Does it pay to watch the garbage pail?

Best Ways of Treating Old Soft Wood Floors.

Old floors of soft wood should receive special treatment. Dressing used for hard wood should not be applied, points out W. H. Ball, assistant in woodwork in the Kansas State Agricultural College.

"Raw linseed oil is the most satisfactory dressing for kitchen, bath and dining room floors," said Mr. Ball. "It has no affinity for water and is more nearly waterproof than any other oil.

"Clean the floor thoroughly. If it has been painted, a good paint remover should be used. Heat the oil to not to exceed 180 degrees, and after removing from the fire add a little turpentine—not more than 5 per cent. This will cause the oil to penetrate into the wood more readily and will improve the wearing qualities. A coat of good floor wax may be applied over the oil if a polish is desired, and rubbed with a woolen cloth or weighted floor mop. This makes it easier to dust or sweep the floor."

If a dark color is desired Van Dyke brown, burnt umber, or some other dark color may be added to the oil, although the oil itself tends to darken the floor. A common paint brush may be used to apply the oil, care being taken to spread it smoothly. Do not allow the oil to puddle, as it will dry on the surface and will peel off or produce glossy spots on the floor. One gallon of oil will cover from 500 to 700 square feet with one coat, depending upon the condition of the floor and the amount of wear. It is well to apply two coats in the beginning and renew with a coat once a year.

A common method of treating old floors in bad condition is to use a good floor paint after the floor has been cleaned. A dark color such as a brown, produced by burnt umber or such neutral colors as will harmonize with the color scheme of the room, should be used, in the opinion of Mr. Ball. It is not advisable to use a cheap varnish, as it is not permanent and will not pay in the long run.

If it is desired to bring out the grain of the wood the floor is stained the color chosen and then from two to three coats of good floor varnish is applied. Shellac is sometimes used for the first or priming coat, as the cost is from one-third to one-half that of varnish, but is not to be recommended for permanent results. In no case should shellac be used exclusively on the floor, as it has a tendency to scar and peel off.

Dandelions Fresh and Canned.

Now is the time to gather dandelions while they are young and tender. They are an important food plant because they contain mineral salts that are valuable to the body.

With a knife cut the dandelions close to the ground. The outside leaves, if old, may be discarded. Wash thoroughly but tenderly between the hands in three or four waters. Then drain either in wire basket or cheesecloth. Plunge them into boiling water and allow them to parboil about five minutes, then plunge into cold water. Remove and finish cooking in boiling water. This method will remove much of the bitter flavor.

If the dandelions are to be canned tie them in a large piece of cheesecloth, parboil and cold dip as for cooking. Then pack solidly into jars. If to be used for "greens" cut or chop, but if used for salad the leaves are not broken. Add one teaspoonful of salt to a quart jar, fill to overflowing with hot water, being careful not to break the glass. Adjust the rubber on the jar. If screw top jars are used fasten down the lids tightly, then turn back one-half turn to allow the steam to escape while cooking. If the E. Z. seal type of jar is used, adjust the top and wire, but do not snap the wire in place.

Put the jars in a boiler to which a false bottom has been fitted and fill the boiler up to the top of the shoulders of the jars with hot water, being careful not to break the glass. Cover the boiler, allow the dandelions to cook one hour from the time the water boils. Then remove, screw or clamp down the tops and cool quickly. As the jar cools it will be necessary to screw down the lid of the Mason jars.

The process must be repeated two days in succession. When recooking the lid of the jars must be loosened as on the first day.

The dandelions will keep if cooked for one and one-half hours on the first day, but this makes the flavor and color less agreeable.

If a steam pressure cooker is used the time required is one hour for one day at five pounds pressure.

When cooking for "greens" a slice of salt pork or bacon, or even bacon or ham rind may be added to the dandelions, and with pepper and salt, we have a delicious dish.

The light green color of the young, tender, fresh leaves makes them an attractive garnish and they may be used in any salad combination where lettuce is suitable. A combination of lettuce and dandelions and either boiled or oil dressing served with salted wafers, makes a delicious addition to any luncheon or dinner.

A good wilted dandelion salad is made as follows: Pour over the fresh, tender leaves a dressing made from one slice of bacon, one-fourth cup vinegar, one-fourth teaspoonful salt and one-eighth teaspoonful pepper.

Cut the bacon in small pieces, fry until crisp, add vinegar, pepper and salt to the hot fat and pour this over the dandelions. If vinegar is too strong a little water may be added.

Recipes.

Spice Cake.—One cupful sugar, one cupful sweet cream, two eggs, one teaspoonful each cloves, allspice, ginger and cinnamon, one teaspoonful baking powder, two cupfuls flour. Bake in a rather hot oven.—M. L.

Salmon Croquettes.—Drain one can of salmon as much as possible and then turn out on tissue paper to drain more thoroughly. Separate the fish into flakes. Make one cupful of white sauce with three tablespoonfuls butter, one-fourth cupful sifted flour, one-fourth teaspoonful each of salt and paprika and one teaspoonful lemon juice. Add the fish, spread on a plate and mix, breaking the fish as little as possible. When cold form into croquettes, roll in egg and bread crumbs, fry in deep fat.

Swiss Eggs.—Four eggs, one-half cupful milk, one-fourth cupful grated cheese, one teaspoonful fat, one teaspoonful salt, pepper. Heat milk and fat in baking dish, break in the eggs, sprinkle with salt and pepper. When nearly done add the cheese. Serve on toast. Strain the milk over the toast.

Apple Pudding.—Two cupfuls bread crumbs, one cupful sugar, two cupfuls chopped apples, one-half cupful butter, and a little nutmeg. Into a well-buttered pudding dish put a layer of the bread crumbs; then a layer of apples; sprinkle with sugar, bits of butter, and a grating of nutmeg; repeat until dish is full, having last layer buttered crumbs. Pour over all one cup water. Bake slowly forty-five minutes. Serve with cream.

Sirup Cake.—One-half cupful sugar, one-half cupful lard, one egg, one-half cupful sirup, one-half cupful sour or buttermilk, one-half teaspoonful cloves, one teaspoonful each cinnamon, nutmeg, salt and vanilla, one tablespoonful cocoa. This can be baked in loaf or layer.—Helen Edenharder.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

What Mother Does.

Dear Young Folks:—Here is a little story we wrote in school. It is about "Little Things My Mother Does for Me."

My mother washes and irons for me, mends my stockings and sews for me. My mother makes good things to eat and sings to me. She buys me lots of nice things and I love my mother more than anyone else in the world.

—Martha.

Picks Lots of Wild Flowers and Fruit.

Dear Young Folks:—I always like to read the letters which the little girls and boys write. This is my first letter.

I live in the country on a farm of 199 acres. My father also owns another farm up in South Dakota. I am fourteen years old and am in the seventh grade at school.

Now we have spring and we have lots of rain, so everything looks fresh and green. We have forty acres of wild forest. In the summer time I go out there and pick a lot of pretty flowers and ferns. I also pick raspberries, plums, grapes and chokecherries.

We have two dogs. One is a shepherd dog and the other a little pet dog whose name is Tricks. He can do many tricks, such as roll around, sit up on his hind legs, bark when he wants anything, and shake hands. He is brown and curly. He is getting old now. When he hears the thunder he is afraid and goes under the bed.

I can tat and crochet and cook, wash and bake and sew. I have four sisters and four brothers. Two of my sisters are married. I am the youngest of our family. I have four nieces and two nephews. We have a car and a piano and an organ.

I send my love to all the young folks and hope they will make our page better every week. —Lillian.

Saw Mother Coon With Six Little Babies

Dear Young Folks:—I have been reading your letters for a long time and enjoy them very much. I am twelve years old and in the eighth grade. I have been neither absent nor tardy this year and received a certificate and also a book from my teacher for getting the most head marks in spelling.

Our school was out the 24th of April and our teacher had a picnic in our neighbor's grove where there is a mother coon and her six little babies. They were the first I ever saw. I wonder if any of the other readers have ever seen a coon.

I live on a farm of 4,000 acres and I go three miles to school. I have one sister going to school, two sisters at home and one brother. I would rather live on the farm than in the city.

—Helen.

Would Fight With Grandpa.

Dear Young Folks:—I am a little boy three and a half years old, with brown eyes and hair. Mamma and I live with my grandpa. He is seventy-five years old and he has taught me all my letters. He tells me lots about the war, for he was a soldier. My Uncle Frank, is a soldier, too, and I have my flag, so if grandpa goes again he says I can go.

I like so much to hear your stories.

—Donald.

A real furnace. Heats whole house comfortably, dependably, cleanly and economically *from one register.* Exactly same construction as the old reliable *Mueller* line, but without pipes or flues. Ideal for old or new homes and buildings with small or partial cellars. Saves 35% in fuel. Burns hard or soft coal, coke or wood.

Made of solid cast iron, has triple jacket, substantial firepot and radiator, best type grate. Designed right, built right. 60 years of experience and the *Mueller Guarantee* behind it.

Tear out this ad, write your name and address on margin and mail to us for valuable free book on pipeless heating, and name of nearest Mueller dealer.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number an d size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also som e points for the needle. Address all orders for patterns and catalogs to WISCONSIN FARMER, Madison, Wisconsin.

Waist 2095-Skirt 2096—Just the thing for summer fabrics. Waist pattern 2095 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 2⅞ yards of 36-inch material for a 36-inch size. Skirt Pattern 2096 is also cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure, and requires 5¼ yards of 36-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

9821—Ladies' one-piece corset cover in round, square or "V" neck edge. Pattern is cut in 6 sizes: 32, 34, 36, 38, 40 and 42 inches bust measure. It requires 1⅜ yards of 36-inch material for a medium size.

2082—One-piece dress for misses and small women. Pattern is cut in 3 sizes: 16, 18 and 20 years. It requires 5¾ yards of 44-inch material for an 18-year size.

1689—Ladies' dress, with sleeve in either of two lengths. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 6 yards of 44-inch material for a 36-inch size.

2080—A pretty "party" or "best" dress. Pattern is cut in 4 sizes: 1, 2, 3 and 4 years. It requires 2⅞ yards of 27-inch material for a 4-year size.

2085—A smart and popular model. Pattern is cut in 4 sizes; 6, 8, 10 and 12 years. It requires 2 yards for the guimpe and 3 yards for the dress, for a 6-year size, in 27-inch material.

1727—A smart suit for the little boy. With sleeve in wrist or short length. Pattern is cut in 4 sizes: 2, 3, 4 and 5 years. It requires 2⅝ yards of 44-inch material for a 4-year size.

1772—A simple attractive dress for home and porch. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 5½ yards of 44-inch material for a 36-inch size.

1724—A smart and simple model. Pattern is cut in 4 sizes; 2, 4, 6 and 8 years. It requires 2¾ yards of 36-inch material for the dress, and 1¼ yards for the bloomers, for a 4-year size.

2089—A charming negligee. Pattern is cut in 4 sizes: Small, for 32 and 34 inches bust measure, medium for 36 and 38 inches bust measure, large for 40 and 42 inches bust measure, and extra large for 44 and 46 inches bust measure. It requires 6¼ yards of 44-inch material for a medium size.

2074—Ladies' "coverall" apron. Pattern is cut in 4 sizes: Small for 32 and 34 inches bust measure, medium for 36 and 38 inches bust measure, large for 40 and 42 inches bust measure, and extra large for 44 and 46 inches bust measure. It requires 5½ yards of 36-inch material for a medium size.

1801—Girls' apron and cap. Pattern for this combination is cut in 5 sizes: 6, 8, 10, 12 and 14 years. It requires 2½ yards of 36-inch material for a 10-year size for the apron, and ¾ yard for the cap.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for May 27, 1917.

The Holy Spirit and His Work—(Pentecostal Lesson).

LESSON TEXT—John 15:26-27; 16: 7-14.

GOLDEN TEXT—He shall teach you all things.—John 14-26.

This lesson follows chapter 15:1-4. The emphasis Jesus placed upon the new and deeper intimacy into which the disciples were about to enter, and which involved a participation in persecutions (v. 20). However, as a garrison and helper when this persecution should come, the believers are to have in their lives the Holy Spirit.

I. The Believer and the Spirit (vv. 26-27). The "paraclete" (helper) was to proceed from the Father, but Jesus was to send him. He is called the "Spirit of Truth" because it is his work to reveal the truth, and it is through his teachings only that anyone may know the truth. Jesus is the truth (ch. 14:6), and the Spirit of Truth is to enable believers to testify concerning Jesus. It qualifies them for such testimony. The disciples also had the added qualification of experience for "ye have been with me from the beginning." The disciples were eye witnesses of what he did and what he was, and heard and knew all that he claimed for himself and what his life proved itself to be.

II. The Believer and Persecution (16:1-6). This section has not been selected by the committee, but as a part of the lesson we cannot overlook it. In it the Master enumerates specifically things that were to come to the disciples and that they might "remember." He also mentions the fact that these things are to come after he has gone away. As a relief from sorrow (v.6), the Master goes on to show the relation of the Spirit to the world.

III. The Holy Spirit in the World (vv. 7-11). It was profitable for the disciples that Jesus should go, that another Divine friend was to take his place. This is the best section in all the Bible to teach the personality of the Holy Spirit. The personal pronouns in this section are very significant, there being seven in the thirteenth verse alone. The word "Comforter" here used means that and much more. It is the same word translated "advocate." In I John 2:1, it means one who is called upon to stand beside another as a helper, counselor, guide and friend. Jesus had been this to his disciples thus far, but he was going away, and another Friend was coming, who should not only be with them, but should dwell in them (Ch. 14:16, 17). The Comforter has come, and without him we can do nothing. He is the one who convicts the world "of sin, of righteousness and of judgment." Of sin, not because they have broken the moral code, but because they do not accept Jesus Christ as the Messiah (Hebrews 10.28. See ch. 3-18-20). In the second place, he is to convict the world of righteousness. The Holy Spirit has no other channel through which he can get at the world except through those who are already saved. He shows the world its error about righteousness; also that Jesus is the only righteous one, and righteousness is only possible to us in him (Phil. 3:9 R. V.) Because he has lived the right life, having fulfilled all righteousness, and gone on high, he, therefore convicts men, but the Spirit does his work through the agency of the world. Man needs to know first of all that he is a sinner; second, that Jesus "the righteousness of God," has provided for us, and it is the Holy Spirit who alone can show these two things to men. In the third place, he convicts the world of judgment because "the prince of this world is judged." This judgment is past (see John 12:31), for Jesus has conquered Satan. Certainly this is a truth that needs to be emphasized in this day. The judgment of sin and punishment for sin, due to unbelief or rejection of Jesus Christ, is seldom preached in our day.

IV. The Spirit and Truth. (vv. 12-15). There was much more that the Master might say to the disciples, but they were not ready to bear it (v. 12). He, however, looks forward to the day when the Spirit shall come, and they will be ready to receive these things. The Spirit will guide them into truth, all truth, for he shall not speak of himself, he will not bear witness unto or speak "from" himself, but the things that he will speak of will be concerning Jesus. The real evidence of the presence of the Holy Spirit in a believer or in a congregation is the degree of exaltation given to Jesus Christ.

There is a progressive intimacy in John. Jesus first calls those who are at his side, servants (Ch. 13:13). He next calls them friends (Ch. 15:15) and lastly he calls them brethren (Ch. 20: 17). This is the law of Christian experience.

Sunday school teachers should certainly take advantage of this lesson to bring out the work of the Spirit (vv. 8, 9, 10); the gifts of the Spirit (I Cor. 12); and the fruits of the Spirit (Gal. 5:22, 23). Let us be sure that our scholars know what it means to have a definite, intimate, personal relation with the all powerful one.

Ask your neighbor to subscribe for **The Wisconsin Farmer.**

The Men's Koverkote is shown above. It is one of the many dressy Raynsters for men.

SLIP on your Raynster and be off to town. Whether sunshiny or cloudy, a Raynster is the logical coat. Sundown might bring drizzle or downpour and then your Raynster will keep you snug and dry.

Raynster
Reg. U. S. Pat. Off.

That's the name of a whole line of storm-coats. They are made for men, women, boys and girls in all sizes, styles and prices.

There are double-texture Raynsters—sewed, cemented and strapped seams; lighter single-texture coats with rubber linings and also rubber-surface coats. Every Raynster is made carefully and thoroughly—each seam sealed and inspected.

Look for this Label on your Coat

Reg. U. S. Pat. Off.

Don't just say "raincoat" when you go to buy—say "Raynster." If your dealer can't supply you let us know. Write us for interesting booklet showing many styles of Raynsters.

OUR LEGAL DEPARTMENT

THIS department is edited by a practicing lawyer who has had years of experience at the bar. He will give accurate and reliable answers to all legal questions when they are of sufficient importance to be of practical interest to any considerable number of our readers. Subscribers who desire questions answered in this department should base them upon a brief, plain, concise statement of the actual facts. To insure immediate attention inquiries should be addressed to "The Legal Department," in care of this paper; but as the inquiries sent are at times very numerous, thus delayingprinted answers, those to whom it is important to receive an immediate reply by mail should remit $1.00, addressed as above.

Law Questions.

Collection of Poll Tax.

A Subscriber, Northfield, Wis.—The property owners in this town pay a road tax. A certain person refuses to pay his poll tax. How can it be collected by law?

Answer.—The superintendent of highways in the town can notify such person to pay his poll tax and if he neglects or refuses to do so the superintendent can levy on and seize any of his goods and chattels and sell them to pay the tax.

Neglected Child.

A Subscriber, Kenosha, Wis.—A little boy now six years old, lost his mother when he was two years old, and his father has had entire care of him since. The father is addicted to the use of intoxicating liquor, and frequently takes the boy to town with him and into saloons, and gives him all the beer he wants. The child is neglected, and does not get proper food, nor care in other respects. What can be done about it under the laws of Wisconsin?

Answer.—Present to the county judge an affidavit of the facts showing that the physical or moral welfare of the boy is seriously endangered by neglect and the immoral habits of the father and thereupon the judge will investigate and remove the child from the custody of the father and provide it with a suitable home elsewhere.

Tax Sale—Mortgage—Redemption.

A Subscriber, Brookfield, Wis.—A bought fifty acres of land in Wisconsin. B holds a mortgage on the land. A failed to pay taxes on it, and it was sold for taxes. C bought up the tax certificates, and got a tax deed to the land, and sold the land to D. Does B's mortgage hold good and can he redeem the land?

Answer.—Either A or B could have redeemed the land from tax sale within three years after the tax certificates were issued, or at any time before the tax deed was recorded, but if the tax deed to C has been put on record it closes out B's interest so that he cannot redeem the land. If the tax deed is not recorded B can still redeem the land and thus protect his mortgage interest by paying what the land sold for at tax sale with all subsequent charges and 10 per cent interest and back taxes up to date.

Naturalization—Exempt Property.

A Subscriber, Maple, Wis.—(1) A foreigner who had taken out his first naturalization papers in this country, was a soldier in the United States army in the Spanish-American war in 1898. Did he thereby become a full citizen of the United States without taking out his second papers? (2) How much property can a farmer in Wisconsin claim as exempt from an execution on a judgment for a grocery bill?

Answer.—(1) He did not become a full citizen by his service in the army, but can be admitted by filing a petition in court, proving such army service and that he is of good moral character and has lived in the United States one year next before filing said petition. (2) Family Bible and all other family books and pictures, seat or pew in church, all family wearing apparel, beds, bedsteads and bedding, sewing machine, stoves and fixtures, cooking utensils and other household and kitchen furniture to the value of $200, two cows, ten hogs, one yoke of oxen and a horse or mule, or in lieu thereof a team of horses or mules, ten sheep and the wool thereof," one wagon, cart or dray, one plow, one sleigh, one drag and other farming utensils to the value of $200, feed for all said animals for one year and provisions and fuel for family for one year.

Ailing Animals.

Injured Hock.

We have a horse that was kicked in the hock joint about the middle of February. It is swollen to twice its usual size and is very sore and lame, but not stiff. It is open on both sides and the matter runs out. The sores have been kept clean by injecting lysol into them. Hot water applications have been used three times a day. We have had both flax seed and brown sugar and soap poultices on them. This draws out a good deal of clots and matter, but it still seems caked and hot at times. We have used liniment and healing oils also, but there seems to be no change.

This is a case which should have the immediate attention of a competent veterinarian if any good results are to be expected. We would not feel justified in prescribing here.

Induration of Udder.

I have a cow that has had a caked bag ever since she freshened about two months ago. Have done everything I knew of, but have had no success. Only one quarter of her bag is affected. She only gives about a quart of milk. She is three years old and has always been a good milker until now. She gives as much milk out of the swollen side of the bag as from the other.

There is an indurated condition present here, following inflammation. This may be hard to remove, since it has been this way for considerable time. Try daily application of the following to the affected parts. Gray mercurial cintment, two ounces; vaseline, one ounce. Mix well and rub small amount into affected part daily unless irritation is noticed, then discontinue use for awhile.

Loss of Pigs.

I would like to know what is the trouble with my pigs. Some of my sows farrow whole litters and not a live pig in the litter. We now have twenty-five pigs from seventeen sows. I feed a bushel of corn a day to twenty-one hogs, with house slop and water. We have a rubbing post and use crude oil mixed with coil oal, but we have not used oil of any kind for four weeks. The pigs are full grown and seem all right. We have not lost a pig that came alive. Our hog house has two raised doors, one about twelve inches, the other about two feet. Both doors have a bridge leading up to it with cleats about three inches apart. We have had this hog house five years and never had this troubde before. We are hoping to raise a hundred pigs this year.

This condition is often seen and is brought about from lack of vitality within the pigs themselves, causing death before or shortly after birth. There might have been injury here and even the feed might have been at fault, but it would be hard for us to name the exact cause.

A Day on Pabst Stock Farm.

(Continued from page 1.)

ing to Mr. Pabst this system of raising the young stuff has done much to keep tuberculosis out of his herd. Besides good breeding breeders are anxious for stock that is safe from tubercular infection and there is no better system for the breeder to follow in order

Pabst Champion, sired by King Pontiac Champion. She made a record of twenty-eight pounds of butter in seven days.

to keep this disease out of a herd than to provide natural conditions, plenty of air and outdoor exercise.

Since beginning in Holstein work Mr. Pabst has sold no heifer calves of his own breeding from the farm. The bull calves are sold at all ages. Eight years ago the average price was below $100 per head. Prices now range from $200 to $2,000. Breeding plus a reputation for health and vigor is responsible for this. The cream from the farm is sold to a Milwaukee dealer at market prices, and amounts to a goodly sum each year.

Besides the cows there are on the farm several thousand pure-bred chickens of Single Comb White Leghorns and Rhode Island Red varieties. These form a separate venture.

A few Percheron mares and several Hackney horses, together with a herd of Berkshires and some 200 grade sheep, complete the live stock population.

Manure is hauled to the fields the year around. It is the plan to manure crops soon after seeding, as the best results have been obtained from this method. A system of rotation followed on the thousand acres under cultivation consists of a general plan for each unit, comprising in all eight years,

Pabst Canary Queen 2d, 29.17 pounds, sired by Sir Hengerveld Model Johanna, farm herd bull at Pabst Stock Farm. Two half sisters have records of 31.5 and 30.3 pounds, respectively, and one of these, Pabst Hengerveld De Freule, has just completed a yearly record of 940 pounds of butter and 20,516 pounds of milk.

and worked out with a view towards obtaining plenty of hay on the fields nearest to the respective barns. The rotation is corn, oats, clover, corn, bar-

Pabst Golden Rod, sired by King Pontiac Champion. Has record of 26.02 pounds of butter in seven days as three year old.

ley and alfalfa. The farm is divided into eighty-acre fields, each field forming a separate unit and having the above rotation.

It is the plan to use the large con-

Pabst Hengerveld Colanthus. 1916—31.5 pounds of butter in seven days; 1917—30.32 pounds of butter in seven days. Had twin calves in 1917 and both above records were made in eleven months.

crete pavilion which was formerly the exercising pavilion during the days when Mr. Pabst bred horses, for the storing of fodder and bedding, leaving ample room for a sheltered place where the cattle can exercise during the rougher weather in winter. The pavilion is large enough to accommodate a complete threshing outfit and allow ample room for wagons and teams. Two tractors are used on the farm for plowing and threshing work. All of the corn which is not used for the eight monster silos on the farm is husked and shredded and the shredded fodder is used for bedding. Thus it is returned to the land and little of the plant food contained in the stalk is lost.

In the future enough stock will be produced on the farm to justify annual and semi-annual sales, which can be held in the pavilion with little trouble. Bull calves will be sold the year around, as at present, but under the plan proposed no females will be sold privately. These animals will be strictly of Pabst breeding from the cows and sires on the place. The method of raising all animals and the constant care they have received, together with the limiting of entry to stock bred on the place, will insure a safe and clean sale.

Every two weeks the various men carrying responsibility in the operation of this large Holstein establishment are asked to meet with Mr. Pabst for an informal talk and discussion of good and bad points in the operation of the farm. In this Mr. Pabst is following the system used in most business houses and which has proved a great factor in keeping men interested in the firm's welfare. This interest has a great bearing on the success of any establishment of a larger scale, and that is what the Pabst Stock Farm represents. Much money has been invested in making the place the most modern and practical of farms, but the Holstein is paying dividends.

THERE is one thing no man on earth can do, and that is to put sappiness into cheap, coarse tobacco. It takes the richest, sappiest tobacco that grows, to make satisfactory chewing. That is why so many are changing over to W-B CUT. Excess sweetening makes a poor substitute with intelligent people. Pound for pound, there's more tobacco in W-B than in ordinary plug; and it's sappy tobacco, every shred of it.

Made by WEYMAN-BRUTON COMPANY, 1107 Broadway, New York City

WANTED A Man To Travel For A Profitable Business

YOUNG MAN—21 years or over, with some farming experience preferred. To take charge of a profitable retail business in your county. Good reference required. If interested, samples on request.

A Rare Opportunity

You owe it to yourself to investigate.

For complete particulars, write (mention this paper) to

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 15.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Dr. N. W. Downing & Brother, Waukesha.

DR. N. W. DOWNING & Brother are dispersing their entire herd of 50 head, including their great five-year-old show bull, Downing Pontiac Butterman, his 25.37-pound dam, her 29.55-pound maternal sister and 21 of his daughters, five of which have A. R. O. records. Included in the herd are nine high record A. R. O. daughters of King Hengerveld Pondyke, that has 30 A. R. O. daughters. King Hengerveld Pondyke is a son of King of the Pontiacs, from a 25-pound cow. Among other attractions of his herd are eight sons of Downing Pontiac Butterman, several of them have A. R. O. dams and grandams and are nicely marked, possessing splendid individuality. Twelve of Downing Pontiac Butterman's daughters and his dam are bred to Concordia De Kol Rag Apple 163748, a 31-pound son of the famous Rag Apple Korndyke 8th. There is only one female in the herd over seven years. Every female in milk has an A. R. O. record, the lowest being a 13-pound yearling and running up to 29.55 pounds at full age. All heifers are from A. R. O. dams up to 29.55 pounds. Every two year old not in milk, yearling heifers and heifer calves are sired by Downing Pontiac Butterman except one and that is a yearling daughter of the 40-pound bull, Johanna McKinley Segis and she has for her dam a daughter of Pontiac Korndyke, out of a 29-pound daughter of Woodcrest Nig De Kol. His herd also includes a son of Dutchland Creamelle Sir Ascalon, whose five nearest dams average for the year 27,000 pounds milk and 1,000 pounds butter. This herd is not only well known on account of the splendid A. R. O. work which has been done, but for its individuality as well. The senior herd sire, Downing Pontiac Butterman, is one of the greatest show bulls of the breed and his individuality is clearly stamped upon his offspring.—Adv.

Sons of Noted Boars.

WE recently looked over the Poland Chinas owned by Julius Peterson, Kilbourn, Wis., and he has a herd that no breeder would be ashamed of. His advertisement will appear regularly in The Wisconsin Farmer from now on. Mr. Peterson was fortunate in getting two good boars to head his herd, comparatively new blood for Wisconsin breeders. The yearling is a boar of scale with great length and good points in every respect. He is sired by the well-known western boar, Columbus Pan by Columbus, and his dam is by the widely-advertised Golden Gate King—no breeder could want a better boar. Blue Valley Big Bone is a fall boar that if fitted would make a creditable showing. He is by Blue Valley Quality, the best boar Thos. Walker ever owned and out of a Giantess dam by Big Wonder. Here are two real good boars and Mr. Peterson has six fine litters by the first boar—Smooth Columbus. Just at this time he has about a dozen fall gilts, most of which are by a Big Orange bred boar and they are bred or are being bred to farrow in August and September to one of the above boars. Here is a good chance—the gilts are good. Some of the good sows in the herd are of Black Orange and Longfellow breeding. Two good brood sows are by Baron Jr., he by Longfellow Sioux out of a dam by the noted Gritters boar, Baron. There is also a good sow by Long Big Bone, dam by Miller's Big Orange, and she is raising a nice litter of eight pigs. Write now for one of these gilts and if you want some of the pigs, place your order now. Mention this paper.—Adv.

Frank Arnold Durocs.

FRANK H. ARNOLD, Janesville, Wis., is the man that topped the Janesville Duroc Jersey sale last winter when he gave $155 for a daughter of Chief's Col. bred to the champion, King Defender. This sow farrowed 10 and is raising eight nice pigs. Mr. Arnold is one of the best hog feeders in Rock county, and at this time he has some 40 head of gilts and barrows that are about ready for the market. The 15 gilts are the pick of this bunch and they are good, and are being offered for sale now bred to farrow in August and September. They are sired by Sunny Model, he by Blue Ribbon Model, a boar that was a winner at Sioux City, Huron and Lincoln, he a son of the noted, Golden Model 2d. The dam of Sunnyside Model goes back in the third generation to old Iowa Notcher and Tip Top Notcher, of St. Louis World's Fair fame. This is old and standard breeding and can be used most any place with success. These gilts are and will be bred to a Defender-Valley G. boar. We are glad to recommend Frank Arnold and his Durocs, for knowing him as we do we are confident he will give you a good deal and stand back of his guarantee that every sow is to be safe in pig. Write him at once for further information.—Adv.

H. H. Earle, Eagle.

H. H. EARLE is dispersing his entire herd, consisting of 27 head in the Waukesha County Holstein Sale, May 31st and June 1st. There are 11 cows and heifers with records from 12 to 23 pounds butter, some of them junior three year olds with better than 20-pound records. There will be five daughters of Fobes Mutual Diploma De Kol 27.99-pound bull. Several daughters of Fayne Ormsby Johanna that already has a list of 20 A. R. O. daughters, and Canary Oak De Kol Homestead 5th, a 24.60-pound bull out of Canary Oak De Kol Homestead. This three-year-old herd sire is one of the finest individuals in the sale and is a representative of the Jones breeding which may give some idea of his individuality.—Adv.

Dispersal of Linscott Jerseys, May 31st.

THE dispersal of the herd of register of merit Jerseys, May 31st, announced by R. J. Linscott, at Rosalpna Stock Farm, Holton, Kan., is an event that is attracting the universal attention of dairy cattle breeders. The Linscott herd, established 1878, is one of the oldest herds in the West, and has been trained to a high state of efficiency in the production of milk and butter and from the start bred for type, constitution and beauty. The herd which will be dispersed comprises 125 head, including 60 register of merit cows, prize-winning cows, imported cows and home-bred cows, cows with official tests and their sisters, daughters and granddaughters. Linscott Farm has been the home of an illustrious line of notable Jersey sires, including Flora's Golden Fern, R. O. M., class A.; Imported Oakland's Sultan, first-prize bull, Island of Jersey, 1907, and sire of first and champion females, state fairs, and sire of a long list of R. O. M. heifers; Gamboa's Knight (by Gamboge Knight, the most prepotent sire in recent years); and lastly, Jacoba Irene's Premier, the son of the world-famed cow, Jacoba Irene, 1,191 pounds butter in one year, 2,927 pounds and three calves in 37 months, world record. There are 45 heifers in the sale, including granddaughters of Jacoba Irene, the butter queen, also, granddaughters of Gamboge's Knight, the butter sire king of the breed. The fresh cows, heavy milkers and springers and the herd bulls and yearling bulls are in the sale. The herd is in perfect health and will be offered in splendid condition. Good judges have pronounced it the best offering of Jerseys that has ever been made in the West. Those who attend the sale will have the opportunity to enjoy the large company of breeders expected, visit one of the best improved dairy farms in the state and at the same time purchase choicely-bred Jerseys and make profitable investments. See this page.—Adv.

More Additions to the Duroc Ranks.

SWINE WEEK held at Madison last winter did more for the advancement of pure-bred swine than many people realize. Almost every week we find someone who has just purchased his first "thoroughbred" sow or others who are taking more interest in the herd they own as a result of the boost and encouragement that they received at Madison. We recently visited the Webb Farm, at Poynette, Wis., and while Mr. Webb has been a believer in pure-bred stock for many years he did not pay a great deal of attention to that part of the business. His sons, Geo. W. and R. B., are of the younger generation that realize farming is a science and only the best stock can be kept profitably on their high-priced land. Mr. Webb, Sr., has turned over the swine end to the boys and after seeing the start they have made and the care the Durocs are receiving, we are confident that they will make a go of it. They have two good sows by Crimson's Gano, a grandson of Col. Gano and out of Chief of Col. dams. They also have a good sow by King Royal by Royal King out of a Dominant Col. dam that has a good litter by the champion, King Defender. Heading their herd is a son of Lee's Defender. In all they have a herd of some 60 head and in behalf of the Duroc fraternity of the state, we are glad to welcome them to the ranks.—Adv.

Waukesha County Holstein Breeders' Sale.

THE Waukesha County Holstein Breeders' Sale, May 31st to June 1st, will be the biggest offering that the association has yet presented. There will be two complete dispersions, including that of H. H. Earle and Dr. M. W. Downing & Brother's herds. This is a breeders' sale of breeding stock. No buy bidding is allowed and each consigner guarantees his stock to be exactly as represented. All animals consigned are from tuberculin-tested herds and tuberculin tested prior to the sale, under the supervision of the Wisconsin Live Stock Sanitary Board. The sale will commence promptly at 10 o'clock May 31st in the Waukesha County Live Stock Breeders' Association sale barn, Barstow Street, Waukesha, Wis. Write for catalogs to the Waukesha County Holstein Breeders' Association, Waukesha, Wis.—Adv.

Fruit Brothers, Waukesha.

FRUIT BROS. are consigning to the Waukesha County Guernsey Breeders' Sale, June 7th, Lillian May Bishop 31575, A. R. 2608, milk 11,513 pounds fat and 563 pounds as a three year old, sired by Mambrino, that sired four A. R. cows and that is sired by Buckthorn. Her dam is Lillian Bishop 2d, A. R. sired by Glenwood's Stranford, that is sired by Glenwood Boy of Haddon. Here is an exceptionally high-class Guernsey cow that should attract much attention.—Adv.

William M. Jones, Waukesha.

MR. JONES is consigning two animals this year to the Waukesha Guernsey Breeders' Sale, June 7th. Included in this number is Castello's Beauty, A. R. milk 11476 pounds, fat 555 pounds as a four year old, sired by Jeweler of Sunny Valley, that is sired by Lily Ellas Jeweler. The dam of Castello's Beauty is Royaline's Castello, that is sired by Royaline's 2d's Boy. Castello's Beauty's daughter, Castello's Beauty 2d, sired by Lord Waukesha, is an exceptionally attractive young cow as is her mother. These two cows are the kind which are worthy of laying the foundation for new herds as well as the kind which have made the Waukesha county sales famous throughout the country.—Adv.

Those Guernsey Bulls.

DON'T forget that Chas. A. Wilkins, Platteville, Wis., has those good Guernsey bulls for sale. They belong to the aristocracy of the breed, for they are out of high-testing A. R. dams and the sires are the best money could buy. They cost a little more than "ordinary" bulls, but they are worth it. Notice the advertisement in this issue and write for sale list. If you want a good bull, you'll be interested in what they have for sale. See page 22.—Adv.

Some Bull.

SHORT-HORNS of real fashionable breeding that can be purchased at a reasonable figure are very scarce and hard to find, yet there is a two-year-old Short-horn bull in Wisconsin that can be bought worth the money. He was dropped in January, 1915—his name, Sultan Goods. Sired by the $4,000 Royal Silver out of a Marr Missie dam. The following noted names appear in his pedigree: Choice Goods, Whitehall Sultan, Premier, The Lad For Me and the great cow, Princess Alice. A representative of this paper recently saw this bull and we are glad to recommend him to particular buyers. Few bulls of the breed have a better head and front than Sultan Goods. Not only is he a good individual, but he is a good sire, as the crop of calves on the place will show. You realize that his breeding is A number 1 and you will not be disappointed in the bull individually. It will pay you to make a trip to see this fellow. He was bred by Anoka Farms and is owned by F. S. Bunker, Kilbourn, Wis., and if you are interested write him for the tabulated pedigree and description. Please mention this publication.—Adv.

Fox Brothers, Waukesha.

FOX BROS. are consigning to the Waukesha County Guernsey Sale, June 7th, Waukesha's Prospect, sired by a son of Justinee's Sequel of the Preel, sire of 23 A. R. cows and is a son of Galaxy's Sequel; Evangelin of Round Prairie, a daughter to Derulius of Waukesha, that sired one A. R. cow 400 pounds fat; Verandess of Ulao Dale, a granddaughter of Two Creeks, sire of one A. R. daughter and is a son of Select's O. K., that has a record of 418 pounds fat as a four year old and that is a daughter to O. K., that sired eight A. R. cows; Lady Jane of Village View, is sired by Radius, a son of Radium

WAUKESHA GUERNSEY SALE

WAUKESHA, WIS., JUNE 7

60 SELECTED pure-bred Guernseys from the best herds of Waukesha County constitute the offering. No community offers as good an opportunity to select bred-for-production Guernseys as Waukesha County, so that it will pay you to attend this offering. The following is a list of the consignors and a brief mention of some of the animals they are consigning:

FRUIT BROS., WAUKESHA

are consigning **Lillian's May Bishop (31575)**, A. R. 2608, milk 11,513 lbs., fat 563 lbs. as a 3-year-old; sired by Mambrino and out of Lillian Bishop 2d. **Lillian's Milkmaid of Maple Hill**, A. R., milk 12,980 lbs., fat 567 lbs. as a 2-year-old; sired by Langwater Hayes Rosie King of the May and out of Lillian Bishop 2d. **Whitney of Maple Hill and Nancy of Maple Hill.**

GEO. C. HUMPHREY'S CONSIGNMENT

Lass of Springhurst, sired by Linden Duke and out of a dam which, at 10 years, made a record of 12,116 lbs. milk and 526 lbs. fat. **Mirza of Haddon**, sired by Glenwood's Combination 8th.

GOBDELL AND BLOTT'S CONSIGNMENT

Troy Center Blue Belle (50090), Lorraine of Maple Avenue (57187), Murdock's Merry Boy (40782), Imp. Lady 2d of de la Vielle Rue (35237), Lady's Mayflower (58438) and Hero's Violet (35952).

WM. M. JONES' CONSIGNMENT

Castello's Beauty, A. R., milk 11,476 lbs., fat 555 lbs. as a 4-year-old; sired by Jeweller of Sunny Valley and out of Royaline's Castello. **Castello's Beauty 2d** by Lord Waukesha and out of Castello's Beauty.

F. E. KUMROW'S CONSIGNMENT

Emolyn Hope (21225), now on test, 147 days, 4,647 lbs. milk, 254 lbs. fat, full sister to Pauline Hope, 441 lbs. fat.

CHAS. G. HILL'S CONSIGNMENT

Gentian of Sarnia (6908) by Prince of Sarnia and out of Alma of Sarnia, 381 lbs. fat as a 4-year-old. **Imp. Bluebird of Sarnia (46546)**, now under A. R. test, by Imp the Conqueror 3d and out of a 720-lb. fat Island Record dam. **Excel of Sarnia (4401 P. S.)**, now under A. R. test. **Imp. Eugenia of Sarnia (69008), Gracious of Sarnia (71411), Empress of Sarnia (54069)** and **Desire of Sarnia (49572).**

J. S. WILLIAMS & SONS' CONSIGNMENT

Park's Yeksa Queen 2d's Daughter (35593) by Rhea's King of the May and out of Park's Yeksa Queen, 433 lbs. fat as a 4-year-old. **Yeksa's Queen of Cameron (41847).**

G. J. WENDT'S CONSIGNMENT

Dolly's Pride of the Cedars, a splendid individual, sired by a son of Glenauric of Haddon.

R. R. SCHWARTZ'S CONSIGNMENT

Female, sired by a grandson of Trislette's Dirilius; **La Vera Belle, Creamland Jack** and **Gay Prairie Belle.**

C. J. & W. A. CONNELL'S CONSIGNMENT

Maple King of Sunny Slope, that is a grandson of May King's Brangue of Ingleside, and Glenwood's Minerva by Glenwood's Stranford.

GEO. D. DAWSON'S CONSIGNMENT

Mashie's Girlie of Sunnyside by Lindenwood Masher, **Dorinda Flower**, A. R. 455 lbs. as a 4-year-old, and **Queen Tilly of Sunnyside.**

GEO. McKERROW & SONS CO. CONSIGNMENT

Imp. Lady Betty of McKerrow's Farms (68727) by Sarnia Gem; **Imp. McKerrow's Flora of Le Douvre** by a son of Gov. of the Chene; **Imp. McKerrow's Douvre** by Brilliant of the Gree 3d; **Imp. McKerrow's Golden Rose** by Gov. of the Chene, and **Imp. McKerrow's Heaumes Doris**, a granddaughter of Gov. of the Chene. These animals are from the best of foundation stock and are worthy of special notice.

FOX BROS.' CONSIGNMENT

Waukesha's Prospect, a show bull, sired by a son of Justine's Sequel and out of a daughter of Senator Trowbridge; **Evangeline of Round Prairie**, daughter of Derilius of Waukesha; **Verandess of Ulao Dale**, a granddaughter of Two Creeks; **Lady Jane of Village View** by Radius, that is a son of Radium, and **Lady Isabelle of Village View**, same breeding as Lady Jane of Village View.

Remember the Annual Summer Meeting of the Western Guernsey Breeders' Association and the Waukesha County Guernsey Breeders' Association is at the Geo. McKerrow & Sons Co. Farm, Pewaukee, June 6th, the day before the sale. Send for catalog.

Waukesha Co. Guernsey Breeders' Assn.

F. E. FOX, Secretary - WAUKESHA

Auctioneers---Love, Hellen and Benjamin

and Lady Isabelle of Village View, the same breeding as Lady Jane of Village View.—Adv.

Carnation Stock Farms, Oconomowoc, Wisconsin.

FIETJE QUEEN DE KOL, 42.26 pounds, the world's record cow for nine years, has just been shipped from Oconomowoc to their western farm near Tolt, Wash., to be bred to Johanna McKinley Segis, the Carnation Stock Farms' 40-pound sire. After seeing that this splendid old cow was properly loaded on the express car we went out and looked over the herd which consists chifely of daughters and granddaughters of Sir Ormsby Hengerveld De Kol (31212) daughter of Beauty Pietertje Prince (56435) that are showing up well and sons and daughters of Johanna McKinley Segis (4436). Two 30-pound records have been made this winter and they now have a two year old by Beauty Pietertje Prince, that is going at a 25-pound clip. There are 40 daughters of Beauty Pietertje Prince in the herd that are a most promising lot, judging from their individuality and the showing those which have come in, are making at the pail. Those looking for top notch herd sires will find them in the sons of Johanna McKinley Segis and from daughters of Sir Ormsby Hengerveld De Kol and Beauty Pietertje Prince having A. R. O. records up to 31 pounds. They also have five sons of Beauty Pietertje Prince, out of A. R. O. dams up to 25 pounds. See page 23.—Adv.

Will Ship on Approval.

WHEN a breeder offers to ship his stock on approval one can generally depend on the stock and the breeder being on the square. Just at this time you have an opportunity to buy some Duroc Jerseys of fall farrow and if you wish, these will be shipped on approval, so you must be satisfied. We recently saw this bunch and they are real good. The gilts have the stretch, good color and have been carried along in nice shape. They have been bred to farrow the last of August to a son of King the Col. Of the boars, this breeder has five good ones, one of which is outstanding. These gilts and boars are sired by a Defender-bred boar and their dam is a daughter of old Valley G., the litter mate to Illustrator, so you need not be afraid of the breeding. These Durocs will please you, especially at the price the owner is asking. Write this breeder—C. J. Damerow, Beloit, Wis., R. 27, and he will give you a detailed description. Don't fair to mention The Wisconsin Farmer.—Adv.

Geo. McKerrow & Son's Co., Pewaukee.

GEO. McKERROW & SON'S CO. are as usual consigning a number of animals from the best foundation stock on the Island of Guernsey. In the Waukesha County Guernsey Sale this year they will have Imported Lady Betty of McKerrow's Farms 68727, sired by Sarnia Gem, that is a son of Billy's France 2d, that has sired 14 A. R. cows and is a son of Billy's France. Her dam is Red Rose 3d and is a daughter of Shamrock of the Spurs, that sired two A. R. daughters; Imported Fanny of McKerrow Farms, sired by Maid's Star; Imported McKerrow Douvie, sired by Brilliant of the Gree 3d; Imported McKerrow's Golden Rose, sired by Governor of the Chene, that has 63 A. R. daughters and Imported McKerrow's Heaum's Doris, a granddaughter to Governor of the Chene. Her dam is Doris of the Hague, a granddaughter of Prince Alban, that sired four A. R. daughters.—Adv.

Buy Berkshire Pigs.

WHEN you start, start right and if you like Berkshire swine buy where they have the goods. We believe that the Berkshire is going to gain in popularity very fast in the next few years, for as a matter of fact, this good breed of swine has never received the recognition in the corn belt that it justifies, but it is coming and if you want to get in on the ground floor buy a pair or a trio of "Berks" from A. P. Cortte, Lomira, Wis. If you are posted on pedigree you will appreciate Ames Royal 32d, the boar that heads this herd. He comes from the Curtis breeding and carries the most popular blood lines. These pigs were farrowed in March and April and at this time they can be bought worth the money. Write Mr. Cortte at once and please mention The Wisconsin Farmer.—Adv.

S. A. Baird, Waukesha, Wis.

S. A. BAIRD & SON are consigning to the Waukesha Holstein Sale, May 31st and June 1st, a well-grown young calf of exceptionally strong individuality, out of a 27.35-pound dam and sired by Dutchland Creamelle Sir Ascalon, one of the best bred bulls in the state of Wisconsin, whose five nearest dams average 27,000 pounds of milk and 1,000 pounds of butter. They are also consigning a 23-pound three-year-old cow with a daughter having a yearly record of 20,000 pounds milk and 863 pounds butter in a year, bred to Dutchland Creamelle Sir Ascalon to freshen about the time of the sale.—Adv.

Schley Brothers, Waukesha.

SCHLEY BROS. are consigning to the Waukesha Holstein Sale, May 31st and June 1st, Nagawicka 104062, that recently made a record of 20 pounds of butter two months after freshening. She is bred to Pabst King Pontiac Lad 129298, a $1500 30-pound bull. They are also consigning two well-bred heifers bred to this same sire.—Adv.

Dreyer Brothers, Dousman.

DREYER BROS. are consigning to the Waukesha County Holstein Sale, May 31st and June 1st, three head, including a 17-pound yearling daughter of Sir Urmagel Burke, a 31-pound bull with a 35-pound sister. Her half sisters have made records from 18 to 23 pounds as four year olds during the past winter.—Adv.

Buy Young Bull for Head of Herd.

A WISCONSIN Holstein herd that is rapidly growing and which from all indications is destined to become one of the leading herds in the state, is that owned by L. K. Luse, of Superior. Eight years ago Mr. Luse started to raise a herd of full-blooded registered cows in Jefferson, Wis. He has at all times kept a pure-blooded sire and he now has upward of 20 full-blooded cows and heifers. Realizing the necessity of securing as good a sire as possible with a limited investment, Mr. Luse has been quietly searching for some time for the proper bull. A short time ago Mr. and Mrs. Luse were stopping at Waukesha. Having a few minutes to spare they went out to visit the Pabst Farm, not intending to buy, according to them, and were so pleased with the very large herd of Holstein cattle that they decided to buy the young bull, Pabst Korndyke Pietertje, for the purpose of making him the head of their herd. His sire, three years old, Korndyke Segis Johanna, weighs over a ton. Mr. Luse says that the large production of many of the cows in the pedigree was the potent influence which caused him to make the purchase.—Adv.

Red Polled Cattle Demand Increasing.

WE have just receivel the following letter from J. W. Salter & Sons, Red Poll breeders of Unity, Wis.: "We are selling Red Polled cattle through your paper as fast as we can raise them. Just shipped a bull to A. F. Viestentz, West De Pere, and one to Jos. Raab, Auburndale. Tell your readers that we have at the present time three prize-winning bulls that are old enough for service. They are dandies and will improve most herds. The demand has been in excess of the supply. Our aim is to please our customers and we have been successful in that." We saw the Salter herd some time ago and they have a nice Red Poll herd and having seen some of the bulls they sold, we know that they give you value received for your money. The bulls they have for sale are right in every respect and if you are interested in this breed, write them for particulars. Please mention The Wisconsin Farmer.—Adv.

Atwater Durocs.

L. F. ATWATER, Bangor, Wis., has 120 spring pigs, about half of which are weaned and doing fine. The Shank sow for which he paid $310 has a fine litter of five by Investor. The good fall sow that Atwater showed last year has a fine litter of 10 by the junior champion boar, Proud Chief Jr. The best pigs on the farm are by this boar and L. F. has a real show and breeding boar in Proud Chief Jr. The Orion Cherry King boars that he bought in Ohio are doing fine and the Duroc breeder that has a bigger senior boar pig out this fall, than on of these that he expects to show, will have to go some. Notwithstanding the high price of feed Mr. Atwater will have out a full herd again this fall "better than ever." No boars will be offered at this time, they will be held for the boar sale this fall.—Adv.

S. S. Cramer, Hartland.

S. S. CRAMER is consigning to the Waukesha County Holstein Sale, May 31st and June 1st, his 29.49-pound bull that in the point of breeding, individuality and A. R. O. backing is one of the best herd bulls in Waukesha county. Sir Spofford Pietertje Korndyke 156966, is by Dutchland Sir Pontiac Korndyke, that has 10 A. R. O. daughters and is out of Molly Spofford Pietertje 123479, which not only has a 29.49 seven-day record, but has the distinction of winning the 20th association prize in 1913 at three years, three months and 21 days. The breeding on the dam's side of Sir Spofford Pietertje Korndyke is particularly strong in having as many animals which possessed consistent high production. Here is an opportunity to purchase a high-class sire, which is now in his prime, being born November 30, 1914.—Adv

Baird Brothers, Waukesha, Wis.

BAIRD BROS. are consigning to the Waukesha County Holstein Sale, May 31st and June 1st, seven two-year-old heifers out of a daughter of Sir Urgagel Burke, a 31-pound bull with a 35-pound sister. These daughters have records from 18 to 23 pounds as four-year-olds. These heifers are bred to King Superba 176125, a bull that is out of the noted cow, Milanhurst America De Kol, the first cow to be officially tested for one year. It will also be remembered that she has 34 pounds in seven days and held eight world's records at the time she finished her yearly test. It is needless to say that King Superba is one of the most noted herd sires in the state.—Adv.

John J. Reid & Son, Oconomowoc.

JOHN J. REID & SON are consigning to the Waukesha County Holstein Sale, May 31st and June 1st, a daughter of a 27-pound cow bred to Sir Pietertje Ormsby Mercedes 43d, one of Wisconsin's leading sires. The dam of this bull has three records above 31 pounds, the largest being 34 pounds and has the world's record for butter production for three consecutive years. Cows bred to this bull are worthy of particular attention.—Adv.

D. J. Howell, Waukesha.

MR. HOWELL'S 24.75-pound two year old, bred to a 31-pound bull, is one of the most spectacular to be consigned to the Waukesha County Holstein Sale May 31st and June 1st. She has not only made a phenomenal record, but is an individual that possesses indications of a great future. The man

purchasing her will undoubtedly have an opportunity to make a much larger record in one or more of the advanced classes.—Adv.

A Practical Farm Lighting System.

FARM electric lighting plants have demonstrated their convenience and economy on thousands of farms. Farmers who have them do not hesitate to recommend them to others, because they are past the experimental stage and ready for practical use. If you do not have one on your farm it will pay you to make an investigation of the Jupiter plants, made by the Dealers' Electric Lighting Co., 2903 Indiana Ave., Chicago, Ill. They are easy to install, they have the famous two-year guarantee Perfection battery and are equipped with a generator that operates with remarkable efficiency. The Jupiter outfit may be run with any kind of a gas engine or with a water motor or windmill. Where any kind of power is used for pumping water or similar work, the generator may be attached and the batteries charged without any additional expense. In this case the cost of operation would be almost nothing. The care and operation of the Jupiter plant is absolutely simple and easy enough for a child to manage. For full information about this remarkable lighting plant, write the company named above. Without obligation on your part, you will hear from them by return mail.—Adv.

Charles L. Hill, Rosendale, Wis.

MR. HILL is consigning six head to the Waukesha County Guernsey sale, June 7th, which are worthy of special comment. In this number we find Desire of Sarnia 49572, sired by Judge of Birchwood, that is a son of Dairy Maid's King, that sired 12 A. R. daughters and whose sire is Glenwood Boy of Haddon. Also Empress of Sarnia 54069, sired by Prince of Sarnia, that sired six A. R. daughters and that is a son of Masher 60 P. S., that sired 29 A. R. daughters. Also Gracious of Sarnia, sired by Knight Errant, that sired two A. R. cows and that is sired by Skeezicks, that sired 13 A. R. cows and whose dam has a record of 650 pounds of fat as a four year old. Also Imported Eugenia of Sarnia 69008, sired by Daniel's Squire; Excel of Sarnia 4401 P. S., now under A. R. test, Imported Bluebird of Sarnia 46546 also now under A. R. test and Gentian of Sarnia 69081 sired by Prince of Sarnia, that sired six A. R. daughters and that is the son of Masher 63 F. S., that sired 29 A. R. cows.—Adv.

Dr. David Roberts, Waukesha.

DR. DAVID ROBERTS is consigning to the Waukesha County Holstein Sale, May 31st and June 1st, a 27.28-pound bull calf, that is sired by King Hengerveld Pondyke, the best son of King of the Pontiacs and the calf's dam, Queen Schillaard 93154, not only has a seven-day record of 27.82 pounds, but also has a yearly record of 754.71 pounds butter and 18,329 pounds of milk. She is now bred to King Superba, whose dam was the first cow in the United States to be officially tested for a full year and who held eight world's records at the close of her yearly test. —Adv.

Geo. D. Dawson, Oconomowoc.

GEO. D. DAWSON is consigning to the Waukesha County Guernsey Sale, June 7th, Masher's Girlie of Sunnyside, sired by Lindenwood Masher, that is a son of the great Imported Masher's Sequel, that sired 68 A. R. cows. Her dam is Hillside Countess, 395 pounds fat and a daughter of Gypson, that sired 17 A. R. cows. Also Dorinda Flower A. R. 455 pounds fat as a four year old, sired by Prince of Emerald Farm, that is sired by Robiana's Standard, sire of 15 A. R. cows. Her dam is a daughter to Saturn, sire of two A. R. cows and is a son of Robina's Standard.—Adv

Connell Bros., Colgate, Wis.

CONNELL BROS. are consigning six of the best animals in their herd to the Waukesha County Holstein Breeders' Sale, May 31st and June 1st, which includes a daughter from a 27-pound cow bred to their herd sire, Count Johanna McKinley, a son of Johanna McKinley Segis, now at the head of the Carnation Stock Farm herd. We also find in the Connell Bros.' consignment a choice heifer out of an 18-pound daughter of Homestead Junior De Kol and sired by Count Johanna McKinley. —Adv.

C. J. & W. A. Connell, Menomonee Falls.

C. J. & W. A. CONNELL are consigning to the Waukesha County Guernsey sale Maple King of Sunny Slope, a grandson of May King's Vrangue of Ingleside, side of three A. R. daughters, 576 pounds of fat, 597 pounds and 523 pounds fat, respectively; also Glenwood's Minerva, sired by Glenwood's Stranford sire of 16 A. R. cows, a son of Glenwood's Boy of Haddon. See advertisement on page 20.—Adv.

SALE DATES.

Guernsey Cattle.

June 7, Waukesha County Pure-Bred Guernsey Breeders' Assn. sale, at Waukesha, Wis.

Jersey Cattle.

May 31, J. R. Linscott, Holton, Kan.

Holstein Cattle.

May 31-June 1, Waukesha County Holstein-Friesian Breeders' Association Sale, Waukesha, Wis.

Sheboygan Holstein Sale.

The third Sheboygan Holstein Sale did not break any record for high prices even though there were some high-class animals in the sale. Sir Longfield Pontiac Spofford, out of a dam that had a yearly record of 891.35 pounds butter and 21,107.20 pounds milk, consigned by Harry Keach topped the sale at $370. Truttschel Bros.' 29-pound bull calf was the cheapest thing sold, bringing $215. The following is a list of sales:

Quineilo Johanna Korndyke Lad, July 28, 1915; Bein Bros., Plymouth, Wis. $160
Highland Homestead Polkadot, April 11, 1916; W. F. Nehring, Jr., Rolling Prairie, Wis. 120
Highland Segis Longfield, Mar. 21, 1916; E. C. Peebles 115
Highland Careme Johanna, Mar. 10, 1916; Traxler 135
Lucy Segis Careme, Jan. 12, 1916; W. H. Nehring, Jr., Rolling Prairie, Wis. 180
Aurora Homestead De Kol, Nov. 20, 1911; Gramling Bros., Dousman, Wis. 140

An Acre of Roots.

An acre of roots will help winter your stock. This is the slogan of the campaign of the Wisconsin Agricultural Experiment Station for more root crops this year. Upper Wisconsin farmers, especially, are strongly advised to sow root crops in the new clearings or among the stumps. Every settler can grow root crops, while some may not have land suitable for corn. The experiment station workers say that an acre of roots will help feed ten cows during the winter. As feed will be high the cheapest expedient seems to be to raise more roots. Here are some of the advantages in favor of at least a small area for root crops:

1. Yields are 300 to 500 bushels to the acre.
2. Roots do well on new land.
3. Seed cost is low—40 cents to $1.25 a pound or $1.50 to $6 to put in an acre.
4. Easy to grow, requiring no expensive tools.
5. Cool nights of Upper Wisconsin ideal for root crops.
6. Good food for the table or the stock.
7. Helps to keep stock healthy.
8. Provides winter succulence.
9. Takes the place of silo during the settler's first winter.
10. Pound for pound with water out roots are as good food as grain. Roots will cut cost of grain feed at least half without reducing milk yield.
11. Keeps breeding stock in good condition.

Instead of worrying where the feed is coming from next winter for the cows why not buy one or two more and put in an acre or so of roots to help feed these cows next winter? Rutabagas, turnips, mangels, carrots, are all good. The state council of defense urges an acre or more of roots on each settler's place in Upper Wisconsin, as this will help increase the butter and meat production of the northern part of our state.

Wants Effective Dog Law.

To the Editor:—At present the state legislators are in session. This body of intelligent men could materially assist farmers of this state, and at the same time show their loyalty to the country, by enacting an effective dog law to protect the flocks of the farmers against the worthless, sheep-killing cur dogs, which are in a large measure responsible for the destruction and decrease of our flocks. Many states have enacted such a law. Why should not Wisconsin? Frank Kleinheinz.

CONNELL BROTHERS
COLGATE, WISCONSIN
Are consigning six of the best animals in their herd to the

Make a Smith Form-a-Tractor

$255 AND A FORD

Guaranteed to do the Work of Four Big Horses

Smith Form-a-Tractor easily works in freshly plowed fields doing what you ordinarily use four horses to do.

With Smith Form-a-Tractor you can haul your heaviest loaded farm wagons either over the road, out of your fields faster, more economically than you can haul them in any other way.

Put More Acreage at Work

Intensify your farming—put more acres at work—get bigger crops out of the acres you are now using.

If only for **NATIONAL EMERGENCIES** alone, you owe it to yourself to see that your crops are bigger than ever before.

PLOW—PLANT—do all your farm work in the most intensive way with the implements that give you the most intensive farm effort. Smith Form-a-Tractor on your farm will **INCREASE** your **LAND VALUE** per acre—increase the acres under cultivation—increase your value to the community and your earning value to yourself. Conserve your resources—intensify your farming effort with the utmost economy. Smith Form-a-Tractor allows you to use the wonderful power of your Ford touring car or roadster and convert it into money earning power on your farm—without in any way detracting from the efficiency of your Ford as a touring car or roadster, or from its service to you.

Four Horse Ability

Without adding a cent to your investment except the $255 for the Smith Form-a-Tractor, you immediately add four horse working ability to your farm simply by utilizing the power in your Ford which would otherwise be idle.

And this four horse working ability is applicable to every bit of farm work that you now need four horses to do.

Unhampered by Weather

Smith Form-a-Tractor used with your Ford touring car or roadster gives you four horse working ability in all weather.

Even on the hottest days when horses drop dead in the harness from exhaustion, Smith Form-a-Tractor will work twenty-four hours a day, if necessary, unaffected by heat—unaffected by any weather condition—always serviceable—always efficient—alway saving you 75c out of every dollar you now spend to maintain horses in the same work.

Work Faster—Better

Smith Form-a-Tractor will easily plow seven acres to every four acres you can plow with horses. It will operate steadily at a speed of 2½ to 3 miles an hour. It will plow deeper, and in every other line of farm work it will show the same superiority over horse service that it shows in plowing.

Use it for hauling heavily loaded farm wagons out of your fields.

What Smith Form-a-Truck with its famous Convertible Eight-in-One farm body has meant to general farm hauling, Smith Form-a-Tractor means to every other form of farm work. The day of expensive farm horses is gone; the day of economical power is here in Smith Form-a-Tractor.

This Is What You Get

In Smith Form-a-Tractor you get, as permanent features of your Ford, a new radiator, cellular type, ten times as efficient as the ordinary Ford radiator, guaranteeing perfect tractor operation, increased serviceability from Ford touring car or roadster.

You get the famous Strong Force Feeding Oiling System fully patented, pumping oil to the crankshaft bearings through a sight feed on the dash. You get the attachment with reinforcing frame, which extends the full length of the Ford underneath it.

Wide tractor wheels each equipped with twenty seven conical lugs—give eleven to one increase in Ford pulling power through roller pinion and bull ring drive system with the power applied downward keeping the strain away from the Ford developing maximum pulling power in tractor wheels.

And you get a conversion which takes only fifteen minutes to install or remove, after the two permanent features, the radiator and the oiling system have been installed.

Do Not Delay

Every farmer interested in developing the maximum earning power of his farm will use Smith Form-a-Tractor.

Do not delay in placing your order. If there is no dealer near you, send the coupon below with $10 attached to it and we will ship you a Smith Form-a-Tractor, sight draft attached to bill of lading.

If you want further information before you make your purchase, check off the booklet you want and send us the coupon.

But act NOW!

THE WISCONSIN FARMER

VOL. XLVI. NO. 22. THURSDAY, MAY 31, 1917. WHOLE NO. 1844

Road Work Through the Summer.

Sauk County, Wisconsin, Boys Engage in Effort to Keep All the Roads Dragged and in Condition for Travel.

A COMPANY of boys in Sauk county, Wisconsin, are engaged in what is called the Boys' Road Dragging Contest. Inasmuch as this is a step forward in taking care of the natural roads, our readers all over our state will be interested in some of the details of this contest. Mr. W. H. Babcock, associated in rural Y. M. C. A. work in Wisconsin, is secretary of the Boys' Road Dragging Contest and he has furnished us with the facts which are used in this article.

The work for 1917 was inaugurated by sending out a letter in March explaining what the sixty boys who had been engaged in the road dragging contest in 1916 had done, urging at least 100 boys from fourteen to nineteen years of age to join in the work this year. The contest this year is by townships, so that those who enter will not compete with boys in other towns. There are cash prizes in each town, but a committee is proceeding upon the plan of checking up the work frequently, so that they may know how the boys are doing. In cases where the road past any places need grading, boys are urged to see their town officers and get them to put it into shape as soon as possible. In this same letter the Good Roads Committee urges the boys of Sauk county to write or see Mr. Babcock and make suggestions for the summer's work. In addition, the boys are asked to keep in touch with the town board and to offer themselves for road work when such work is needed. For this work they get the usual wages in addition to the chance of winning a prize.

ERWIN LARRIDEN, OF THE TOWN OF REEDSBURG, SAUK COUNTY, AND HIS TEAM AND DRAG.

As before stated, the letter sent out to boys throughout the county was the opening gun in the 1917 drive for better roads all over Sauk county.

At present writing, May 20th, about the same number of boys have been set at work as last year, while a number of others are to begin as soon as their mile of road can be graded.

Sauk county does not claim any originality in promoting this idea. It was started in Rock county in 1915 by Mr. George F. Parker, the fountain pen manufacturer, of Janesville, and L. A. Markam, county Y. M. C. A. secretary, who has now become Rock county's agricultural representative or county agent.

When Sauk county's board of supervisors heard about it from Sauk county's Y. M. C. A. man, W. H. Babcock, they adopted the idea at once. The above committee was appointed from among the members of the board, and were authorized to spend $30 in printing and postage to promote the scheme. They also spent a few dollars for gasoline in inspecting the work, but when they reported at the November meeting on the results the committee was promptly reappointed, and the printing and postage allowance increased to $50 for 1917.

FOUR GOOD FARM HORSES FURNISH THE MOTIVE POWER.

How did they get the boys? In many cases the town chairman and his road supervisors simply hunted up every available boy, and if the road past his father's farm was of such a nature as to be helped by a road drag, he was employed to take care of that mile—in some cases two miles. Some towns paid thirty-five or forty cents per hour for boy and team, while others paid a flat rate of $10 for the season per mile of road. In every case where they graded up the road properly the boy "kept the roof" on with the drag.

Some town chairmen brought the matter up at town meeting, and in some cases the voters turned it down. In others the town board simply went ahead and disposed of part of the highway fund in that way. In one such town the matter was referred to at town meeting this year, and while one man said he thought it was a waste of money, half a dozen at once replied that it was the best road money the town had spent last year.

Mr. A. R. Hirst, state highway engineer, went with the boys and their fathers on an auto tour, in October, over the greater part of the boys' dragged roads, and his report was: "The only fault to be found with the boys' work was that in a good many cases their road was not graded up as it should be, so they had no chance to show what they could do." A salesman who lives at Reedsburg and travels by auto or team, says that even in the winter he could always tell in the dark when his wheels reached the edge of Washington township, where nineteen boys dragged about twenty-two miles of road. This was the home town of Mr. Schenk, chairman of the committee, and he saw to it that it was the banner township for boys' road work. One of his boys, Albert Schenk, and also Carl Hirschinger, in Baraboo township, were awarded gold watches by members of the county board, who dug up the money out of their own pockets because of the extra good work done on hilly, stony roads. These boys picked up a lot of loose stones after each dragging, and made good roads out of what had been bad ones. The gold watch offered by the Reedsburg Times was awarded by the editor to Erwin Larriden, whose mile of road is on the main line between Reedsburg and Lavalle, and subject to heavy traffic at all seasons. He has shown good judgment in dragging (or not dragging) his road at the right time. The "when" is just as important as the "how" in using the road drag. That is why no one or two men can attend to any great mileage of earth roads. It must be done by a large number of farmers or their sons, who live right beside the road to be cared for, and who can each study the peculiarities of his own section of road.

The contest for the most part was by townships only. It was easy to get a dollar from each of 112 auto owners for a prize fund, which made it $2 per boy. This fund was divided among the various townships at that rate, so that the town with three boys at work got $6 prize money to distribute, and the town with nineteen got $38. Some special checks were printed for the distribution of the prize fund. Each boy was supplied with a button badge; also with a printed sign, to post up beside his section of road, with the words: "Sauk County Boys' Road Dragging Contest, Section No. ——." Each boy was also sent a copy of the government bulletin on the split log drag Some of them followed the directions in this bulletin and built their own drags. But for the most part the town boards purchased enough iron drags to do the work.

Perhaps the best endorsement of the plan is that which came from the rural mail carriers. At their county convention on Washington's birthday they passed a resolution approving it and pledging their assistance. Since then they have helped to find a good many new boys for the work. The county highway commissioner, too, has not been so busy building macadam roads that he failed to notice what the boys were doing. Before the spring election he wrote to the chairman of each town, commending the scheme of setting older boys at work on earth roads. Some towns which had no boys at this work last year have joined the procession now, with from three to ten boys at work.

As proof that it pays to get boys interested in good roads while they are boys, notice this: Last December there was a week of warm weather, when roads thawed out. The contest had closed in November, and they would get no pay for work done later, and yet the habit was strong enough to bring out the majority of these young road makers, and their roads were nicely smoothed before they froze up for the winter.

After all, the present benefit to the roads is only one side of the proposition. The other is the forming of habits like these, so that the next generation of farmers will be better road makers than their fathers were. The Wisconsin Farmer commends this plan to other counties.

More Grain for the Farmer; More Profits for the Thresherman

THE Red River Special saves the farmer's high priced grain—and saves the thresherman's time. *It beats out the grain.* Most threshers wait for the grain to drop out. The big cylinder, the "Man Behind the Gun" and the beating shakers do the work just as you would do it by hand. Write for literature on the

Red River Special

If you are a thresherman, learn how you can get the big money-making runs. Crowd more bushels into the day's work—more good jobs into the season's run.

If you want a thresher for your own use, learn about our Junior Red River Special, the small thresher built with the efficiency of big high power machines. Hook it to your tractor or gasoline engine. Saves the grain like the Red River Special. Makes home threshing pay. Built for long service—has large, strong shafts, wide belts, strong frame. It saves the farmer's thresh bill. Write

CURRENT EVENTS

THE fight over the prohibition of the use of grains and cereals in the manufacture of intoxicating liquors promises to occupy much of the attention of congress and to become quite bitter. The senate went on record favoring the measure of Senator Cummins, of Iowa, prohibiting the use of grains for such liquors during the war and for one year afterward, but later it rescinded its action. The liquor interests are prepared to make a hard fight, but the prohibitionists are not dismayed. Foremost in their support is the council of national defense, whose advisers on this question have recommended with practical unanimity the prohibition of the use of grain in the manufacture of liquor and the employment of distilleries henceforth in making pure alcohol as an ingredient of ammunition. Prof. Irving Fisher, chairman of the council's subcommittee on alcohol, asserted that sooner or later the nation will be compelled to adopt prohibition as a war measure. Speaking in favor of the prohibition of the use of grains for alcoholic purposes Professor Fisher gave these facts: "Nearly 2½ per cent of the total crop of those cereals used in manufacturing alcoholic beverages are diverted to that use, while 5 per cent of the total crop of rice and 34 per cent of the total crop of barley are so diverted. More than 110,000,000 bushels of grain are used in the production of alcoholic beverages, 415,000,000 pounds of grapes and 152,000,000 pounds of molasses. In all about 7,500,000,000 pounds of food (grain, grapes, grape sugar, glucose and molasses) are so used each year. After making allowance for the production of denatured alcohol, the total fuel value so diverted each year is sufficient to supply the yearly energy requirement of over 7,000,000 men."

ENGLAND has at last awakened to the fact that she must solve her Irish problem before she can consistently accuse other nations of outrages in Poland or condemn them for not being a nation wholly by the consent of the governed. For the first time in modern history, the destinies of Ireland are to be placed in the hands of the Irishmen alone. Last week, the British prime minister, David Lloyd George, announced to the house of commons that the government will call a convention of Irishmen to frame a constitution for Ireland, and if Irishmen are able to agree upon any scheme for the administration of their country, will attempt to enact it into legislation without delay. All sections, parties, creeds and factions, with clergymen and laymen, as well as politicians and even revolutionists of the Sinn Fein society, will be invited to get together. In making his proposition before parliament, the premier said there was one thing common to the failure of all attempts to arrive at a settlement—that the proposals had emanated from a British government. The present government, therefore, had decided to invite Irishmen themselves to put forward their proposals. Hitherto Great Britain had undertaken all the construction and Ireland all the criticism. Once Irishmen were confronted with the problem they would give due weight to the obstacles and differences, he believed. The government proposed Ireland should try her own hand at framing a plan. This method, he said, had succeeded in Canada, Australia and South Africa, and he could not help thinking that what had been achieved there could be achieved in Ireland.

ALL three arms of America's fighting forces—the army, navy and marine corps—will be represented in the war zones of Europe in the near future. With American submarine destroyers already operating in European waters, chasing the German submarine, and with army regulars concentrating to carry the stars and stripe to France and Belgium, a regiment of marines (the fighting men of the ships) was last week designated to join the first expeditionary force. The marines will be attached to the army division under General Pershing, which is under orders to proceed abroad as soon as practicable. Although details are not being made public, it was calculated that, with the marine regiment, the total American force now designated for land service in Europe is close to 40,000. An army division at war strength comprises about 25,000 men, and upward of 12,000 are expected to be in the nine volunteer regiments of engineers now being recruited. The forestry regiment and the marine regiment each will number more than 1,000. The strength of the naval force in European waters has not been revealed. General Pershing and his staff will sail for Europe ahead of the troops, as there is much to be done on the other side to pave the way for final training of the force and to make ready for the huge army the United States is preparing to pour across the seas as rapidly as the men can be trained and equipped.

PRESIDENT WILSON has finally and positively decided not to accept the services of the volunteer troops which Theodore Roosevelt proposed to organize and lead to the allied trenches in Europe. Congress left the matter discretionary with the president and he states that he was advised by military experts, both in this country and abroad, to veto the proposition. In his public statement the president paid a high compliment to Mr. Roosevelt's patriotism and heroism, adding: "But this is not the time or occasion for compliment or for any action not calculated to contribute to the immediate success of the war. The business in hand now is undramatic, practical and of scientific definiteness and precision. I shall act with regard to it at every step and in every particular under expert and professional advice, from both sides of the water. That advice is that the men most needed are men of the ages contemplated in the draft provisions of the present bill, not men of the age and sort contemplated in the section which authorizes the formation of volunteer units, and that for the preliminary training of the men who are to be drafted we shall need all of our experienced officers." There is some talk that Roosevelt may be given a commission in the regular army and accompany General Pershing's expeditionary force when it starts for Europe, about September 1st. He may join the New York National Guards. That he will be in the fighting forces in France before very long now seems almost assured.

PRESIDENT WILSON has asked Herbert C. Hoover, the American director of Belgian relief, to undertake the emergency food administration of the country during the war. Mr. Hoover has accepted on condition that he may serve the nation without compensation. Authority for the appointment of Mr. Hoover as food controller is provided in the bill now pending in congress. Until it is passed nothing definite can be done. The president, however, clearly outlined his desires in a statement issued on the subject. Control of food products by a board independent of the department of agriculture is proposed in order that there may be no fear of the possibility of a permanent bureaucracy arising out of it," the president said. In his public statement, President Wilson said: "Authority is asked also to establish prices—but not in order to limit the profit of the farmers, but only to guarantee to them when necessary a minimum price which will insure them a profit where they are asked to attempt new crops, and to secure the consumer against extortion by breaking up corners and attempts at speculation when they occur by fixing temporarily a reasonable price at which middlemen must sell." There is a general belief that congress will establish a minimum price for farm products before it finishes this line of work, something which most authorities are agreed should be done, without undue delay.

THE number of men killed in the war thus far is estimated at 7,000,000 by Arthur Henderson, member of the war council of Great Britain. He estimated the total casualties of the war to be in excess of the population of the United Kingdom. (The population of the United Kingdom, according to the census of 1911, was 45,370,530.) Mr. Henderson said that after nearly three years of military effort there was no immediate prospect of cessation of hostilities. The severe character of the war and its prolongation tempted some persons to ask why peace should not be attempted by other means. He would tell them, he said. It was because the challenge thrown down by Germany in 1914 still held good. The lust of world domination which dictated the policy of aggressive military action on the part of Germany continued to be supported by the German emperor and his Prussian advisers. Until the great act of liberation had been fully achieved the allies could not falter.

THE army war bill has been passed by both houses of congress, signed by President Wilson and is now the law of the land. The president's signature set in motion immediately machinery designed to produce within a year's time a national army of more than 1,000,000 trained and equipped men backed by adequate reserves of men and supplies and by an additional 500,000 soldiers under training. June 5th is the date fixed by the president for registration, to be completed within five days and to be followed by the process of selection which will determine the first 500,000 men to be called to the colors about September 1st. Meanwhile the war department is pushing vigorously its preparations to mobilize the national guard, which with the regulars forms the first line army. It was announced that all existing regiments of the guard will be called into service by August 5th and officials estimate that with from a month to six weeks' intensive training these troops will be ready to go forward for final preparation behind the fighting lines in Europe for the fighting that is before them. Regular army regiments already are in motion northward from the border, preparatory to the expansion of the regular service to full war strength. Of the 183,898 men necessary to bring the regulars up to the 198,000 mark, 74,[illegible] already have been recruited and the remainder are expected to come in before June 15th.

GENERAL PERSHING, who commanded the expeditionary force sent into Mexico to capture or subdue Villa, and who is conceded to be one of the most able of all the officers of the regular army, will head the force of 40,000 troops which the United States will send to the firing line in France and Belgium as soon as possible, probably by the first of September. General Pershing, a republican in politics, was a brigadier general when he led the forces into Mexico in pursuit of the bandit, Villa. His work at that time won for him selection by his brother general officers as a major general and the choice was heartily indorsed by the war department and President Wilson himself. Under the plans of the war department, General Leonard Wood has been assigned the hardest task of any general officer. He will direct, as commander of the southeastern department, the mobilization and training of twelve divisions or more than 300,000 men, among whom without question will be those who will be first selected to follow General Pershing's forces to France.

Cultivating the Sunflower.

The sunflower seems likely to come into its kingdom. The present high price of the seed is turning attention to it as a possible crop worth cultivation, and this interest is very likely to increase, for the more we know of this crop the more evident it appears that it has a great future.

There are farmers who have grown sunflower seed to a moderate extent and done so with profit, and without anything like a boom, which would be liable to a collapse. Conservative cultivators should try it out. The reason for increased prices for the seed is found in the new uses to which it is put. The oil which it makes is found to be a good substitute for linseed oil. It has long been known that for poultry food the sunflower seed is useful, and that if its use could be more generally introduced, it would be to the great advantage of the poultry business.

The sunflower is not very particular as to soils. It will thrive in any soil which is friable. It will do well on any soil which has drainage, and will laugh at drouths upon high land. Any land where corn will mature a fair crop will also grow the sunflower. Prepare the soil just as for corn and plant the seed with your corn planter, leaving three plants to a hill, just as though it were corn. The Mammoth Russian, which makes only one big head to a stalk, is the best variety. The sorts which branch out, making a dozen small heads to a stalk, must be avoided, for small heads greatly increase the labor of harvesting. For this critical job, we know of no machine which is effective. It is a matter of hand labor.

Birds are very fond of the seed, and it will not be safe to let it fully ripen on the stem, but cut it when the majority of the heads show color. Drive alongside the rows with a big wagon with high box, or rack. Clip the heads with six inches of the stem, using a corn knife. Throw into the wagon until you have a load. Then drive to an airy loft, where the crop is spread out to dry. After two weeks of warm weather, it will be dry enough to shell easily. Use the stalks for summer fuel.

THURSDAY, MAY 31, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

MEMORIAL DAY.

THE war, in which we are now engaged, gives new meaning and solemnity to Memorial Day. Before another year has passed there will doubtless be boys from the fertile fields of the grain belt, as well as from the noisy pavements of the cities, who will have given up their life's blood for their country, for liberty, for humanity. We may hope and pray that this shall not come to pass, but already youth is straining at its leash, and we cannot restrain it much longer.

To me, Memorial Day has always been fraught with peculiar, even painful, significance. It is an echo of that great struggle between brothers, the scenes of which linger in my mind with terrifying vividness. On that day, I lean back in my chair, close my eyes and watch people and scenes of civil war times pass in review in my mind. I see the fint parties of the early sixties, back in the Ohio village where I lived as a lad. I see my father, my uncles and my brothers marching away to war, some of them never to return, leaving an aching void in the family circle which a half century of healing time has not succeeded in filling, even in memory. I see the day when I, too, followed in my father's footsteps and took up arms in defense of my country. Then I think how few there were of that goodly company, setting forth so filled with high hopes of victory, returned to the homes and the hearts aching for them. Yes, my friends, Memorial Day, of all days in the year, is the time of sad, yet patriotic, memories, of rededication to unselfishness and service to our fellow men.

The ranks of the blue and the gray, as they shall march through the streets of our towns and cities this week, will be thin ranks; there will be fewer in line this year than ever before, for the hand of Time can not be stayed and some have gone out from among us, since last Memorial Day, to salute the Great Commander and receive their eternal orders. By next Memorial Day, who knows how many of the sons and the grandsons of the veterans who march this week will be lying in the trenches and redoubts of Europe, staining the soil of a foreign land with their life blood? Who knows, save Him in the hollow of whose hand is our only security?

My eyes are blinded with tears as I write; the text is too sacred for profanation in words. I can only hope and pray that the Great Commander may win His battle for righteousness and truth, for freedom and the eternal verities, without being obliged to send too many of His battalions into the thick of the fray. May some trumpet blast cause the walls of tyranny to fall down, as did the walls of Jericho in the days of old, so His hosts may march through, with flags fluttering and bands playing, to reap the fruits of such a glorious victory as shall mark the end of war for all time to come! Such is my fervent hope and prayer on this Memorial Day.

WHAT WISCONSIN FARMERS' CLUBS HAVE DONE.

I AM very deeply interested in a letter which comes to me from H. G. Seyforth, of Mondovi, Wisconsin, and from which I have been able to get some valuable information relative to the work of the Naples Social Club, of Buffalo county. In another column of this issue appears a report of the work of the Naples Social Club, and I hope that all of my readers will turn to this report and read it carefully. It gives us a splendid idea of what a farmers' club may accomplish. In a personal letter to me, Mr. Seyforth further says in part:

> I think you are doing the right thing by reserving one place in your paper for the farmers' clubs of Wisconsin.

Now that I can see what the Naples Social Club is doing, and since I have read the splendid report sent me a few days ago by Mrs. Mary Huntington Comings, of Eau Claire county, touching the work of the Brunswick Neighborhood Club, I am more than ever convinced that my decision to give more space to club work in the Badger state was entirely right. My readers will remember Mrs. Comings' letter appeared in the issue of May 17th. It is very interesting, indeed, to me to look over these reports and I think it is time well spent for all of us to figure for a minute upon the work that has been accomplished. From these letters I find the following activities have been started in the two clubs mentioned:

Improved social conditions among young people.
Established classes in reading, music and speaking.
Organized tennis club.
Organized community Sabbath school.
Organized rural Y. M. C. A.
Bought a car of crushed lime for use on sour soils.
Bought thirty-five bushels of certified seed potatoes.
Bought spraying materials for members to use.
Held summer picnics.
Held a canning institute.
Conducted sparrow, gopher and crow-killing contests.
Arranging for potato exhibit.
Bought dishes and put in cupboards at schoolhouse.
Secured public speakers for club meetings.
Arranged dances for the young folks.
Taught seed corn selection.
Arranged seed judging contests.
Studied weeds and their control.
Kept parents in close touch with school work.
Distributed alfalfa seed, Sudan grass seed and soy beans.
Distributed egg settings.
Organized egg circle.
Arranged for hot lunches at school.
Held canning bees.
Cleaned the schoolhouse.
Organized special club for young folks.

I have no doubt that when the members of the Naples Social Club and the Brunswick Neighborhood Club see these items listed in their Wisconsin Farmer this week, many will think of other important things which the clubs have accomplished since their organization. But are these not enough to warrant greater support of the farmers' club? I am convinced that if these clubs had done nothing more than get in close touch with their rural school-teachers they would have accomplished enough to warrant all the effort in establishing the club. If they had taken up nothing more than the plan of providing wholesome amusement and entertainment for the young folks, they would have had an object worthy of their time and attention. But see the added activities which have resulted from the organization of these two clubs. I say to you, my readers, that the farmers of our state are not nearly so well organized as they should be. There is power in organization as many of the big enterprises of this country have proved beyond a shadow of a doubt. The farmer and his family may exert their full share of power in the community and in the state at large, and even in our nation, if they will stand together for worthy objects. I stand for more farmers' clubs and greater activities in the ones which are already organized. If there are clubs in our state which have been lying dormant, now is the time to have them reorganized. Let them gather for patriotic meetings, and for such activities as are suggested in the list I have given above.

I would suggest that the list of activities I have given above be discussed at club meetings in our state, and let us discover whether other clubs are doing as much as the Naples and Brunswick clubs are doing. Perhaps someone can give us some new ideas. If so, let me hear from you.

WAS THE FARMER THE ROBBER?

TO THOSE who are making some study of marketing problems, perhaps the following little item, which I clipped a few days ago from a Milwaukee paper, will be of interest:

> A north side woman paid $4 a bushel for potatoes from a grocer in the neighborhood. She found one particularly large tuber that had been cut out with an apple corer, a note inserted, and the piece of potato replaced. The note read:
> "I sold these potatoes for 95 cents a bushel. How much did you pay for them?"

How many of my Wisconsin friends see the full significance of this incident? There was a profit of $3.05 a bushel in potatoes from the time they left the farmer or grower until they reached the consumer. Who will say that this is fair?

Did the person or persons who made this $3.05 profit have any money invested in farm land? I would guess probably not—at least not in any land they worked.

Did the person or persons who made this $3.05 profit plow any ground, buy any seed, plant any seed, do any cultivating, spraying, digging, hauling to market, or any of the other things necessary to bring a potato upon the market?

I guess you will all agree that the negative answer is again correct.

Then why, I ask, should the person or persons who made this $3.05 profit on a 95-cent investment be so favored?

Am I not right in saying that if the potatoes were really to be sold at $4 a bushel, the farmer or grower should most certainly have more than 95 cents? Perhaps someone will answer me that after the potatoes left the farmer they were stored, and hauled on railroads, and dealt out over counters in small lots in the stores. I am willing to admit all this, for I know it to be true. But I am not now, and never will be, willing to admit that this service is worth $3.05 a bushel. Do my readers believe that I am right?

I speak advisedly when I say that the farmer will not always submit to a system which brings big profits on his crops and in which he is not given fair opportunity to share in the profits. The potatoes referred to were not worth $4 a bushel by any honest system of figuring that can be conjured up. They were probably worth considerably more than 95 cents, having been bought by the consumer some weeks, or perhaps months, after they were dug from the ground, and at a time when potato prices were advancing because of the shortage. But if there are to be such big profits in farm products you will find that some day the farmer will wake up to the fact that he can hold his own potatoes, and build his own warehouses to store them in and take part of this profit himself on the crops which he has worked so hard to raise. I do not wish to be understood as objecting to the middleman when he takes a fair profit for the service rendered. Neither do I object to his taking advantage in a reasonable rise in the market. But I have had a suspicion that there are times when moneyed interests will buy up farm crops at as low a figure as possible in the fall, and then lie awake nights figuring out some plan to create a shortage, or at least an imaginary shortage, and boost the prices away beyond all reason. Then the consumer says the farmer is a robber. In the particular case in point, cited from Milwaukee, the farmer was not the robber. I leave it to my readers whether they agree with me. The farmer got a good fair price for his potatoes, but someone else got an exorbitant, a robber price, and the consumer was the victim.

I have often heard that the ideal system is to get more for the produce as it leaves the farm and still send this same produce to the consumer for less money. This might seem ridiculous at first, but I am becoming more convinced every day that it is reasonable, and that by fair and just marketing conditions, farmers may get a better price for their produce and the consumer still receive his food necessities at lower cost. We should not confuse the honest middleman with the food-robber—the speculator—the man who cares nothing for the farmer nor the ultimate consumer. He flim-flams the farmer on buying and robs the consumer whereever possible when selling. I feel keenly the need of laws which will make the food and grain speculator an impossibility.

BUY A LIBERTY BOND.

I DO not know the financial condition of all my readers. I do know, however, that we are enjoying unparalleled prosperity. I do know, moreover, that the farmer is the most patriotic man in the country. These things being so, I believe it will require but little urging on my part to induce a large percentage of my farmer readers to subscribe for the Liberty bonds which our national government is issuing to secure funds to carry on the war.

The farmer is a good business man. The day has passed—never to return—when any smooth-talking stranger, with his hair well pomaded, could sell the farmer a gold brick. The successful farmer of today is every bit as much a business man as the banker behind his wicket. The two simply exert their commercial energies along different lines. This being the case, the farmer is justified in asking for the business details of the Liberty bond issue. I am prepared to give them to him. I think he should ask for such information. Sound business sense, as well as patriotism, demands he buy a Liberty bond.

To begin with, the Liberty bond issue is to be for $2,000,000,000. This is an immense sum, yet we must not forget that it is less than one-fifth the value of the field crops and the animal and forest products of the United States last year; that it is only about two-thirds of the field crop production of the ten states of the grain belt (Wisconsin, Minnesota, North Dakota, South Dakota, Iowa, Illinois, Nebraska, Kansas, Missouri and Oklahoma) last year. Nor must we forget that Uncle Sam is worth something like $225,000,000,000, so that this Liberty bond issue represents merely 1 cent on the dollar

(Concluded on page 5.)

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue **Des Moines, Iowa** — 201 Washington Bldg. **Madison, Wis.**

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of 100 or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address

THE WISCONSIN FARMER, Madison, Wisconsin

Governor Names June 5th "Duty Day."

Gov. Emanuel L. Philipp has issued a proclamation naming June 5, 1917, as "Duty Day." This proclamation conforms to that of the president of the United States issued in the city of Washington on the 18th day of May. Under these proclamations it is the duty of every male person in the state of Wisconsin who has attained his twenty-first birthday and who has not yet reached his thirty-first birthday on or before June 5, 1917, to present himself for registration in the precinct where he has his permanent home or residence some time between the hour of 7 o'clock a. m. and 9 o'clock p. m. on the date aforesaid.

We quote from the governor's proclamation:

No one within the age prescribed by law, and above referred to, is exempt from registration except officers and enlisted men of the regular army, the navy, the marine corps, and the national guard, and naval militia, while in active service of the United States and officers in the officers' reserve corps and enlisted men in the enlisted reserve corps while in active service.

Those who are sick and those who expect to be absent on the day of registration in cities of over 30,000 population, should at once apply to the city clerk, and in all other sections to the respective county clerks for registration cards; and file the same in their respective precincts on registration day. Persons absent from their homes attending schools, colleges and other institutions, will be treated as absentees, and should register under the rules prescribed for such persons.

The governor calls attention to the fact that the duty of registering rests entirely on the man who is subject to registration and any failure on his part subjects him to the penalties of the law. The penalty for failure is imprisonment for not more than one year. The penalty is severe for perjury on the part of any person attempting to evade registering or any person attempting to aid any other person to evade registering. Police officials of all kinds over the state are required to assist in execution of the registration law. They are required to report those who have not registered to the registration board and have authority to require any person to exhibit his registration certificate. The governor calls upon all citizens, patriotic bodies, county defense councils and other patriotic organizations to aid in making the registration a success. Carrying out the suggestion of the governor The Wisconsin Farmer urges every reader of this paper to remind any person whom he may know to be of military age of his duty to register June 5th.

In concluding his proclamation the governor says:

Our country is involved in a great war. The registration of our young men who are of military age is the first act by the government that makes us realize that we are engaged in war. No man can refuse his country's call, and I feel confident that the people of Wisconsin will respond without a murmur. They responded to the call of the country in the wars of former days—they will do so now.

The president wishes us to understand that this is not a draft, but a selection. That to be drafter for military service under this law merely means that the person so drafted has been found physically fit to render service as a soldier, and is asked by the government to do what we would expect him to volunteer to do.

I recommend to the citizens of the state that June 5th be made a memorable day in the history of the state of Wisconsin; that flags be displayed on public buildings and private homes, and that those who go to the booth and register, with the expectaion of rendering a service, will receive the applause that is due a patriotic citizen.

The day should be known by an appropriate name, and I suggest to the people and to the press of the state that we refer to it as Duty Day.

Finally, I express the hope that the law and the proclamation of the president will be complied with by all citizens who are subject to it, that the unpleasantness of inflicting punishment may be avoided, and that you will enable me to say to the president of the United States, at nine o'clock in the evening of June 5th, that Wisconsin stands ready to furnish her quota of soldiers to the nation.

It should be unnecessary for The Wisconsin Farmer to reiterate any of the governor's patriotic utterances or to urge our readers to give strict attention to "Duty Day." We believe that when the registration booths are closed on the evening of June 5, 1917, the patriotic and loyal young men of Wisconsin will all have their names on the honor roll.

Wisconsin Legislature.

By the governor's veto of the Evjue bill all liquor legislation has been defeated for the present session, unless a bill is introduced through a senate committee during the next few weeks. An attempt to introduce such a bill in the assembly following the veto of the governor failed, as it lacked the necessary two-thirds vote of approval of this body. Under the Evjue bill the people would have voted upon the question of wet or dry Wisconsin next year. It is likely that future political candidates will have to come out flat-footed for one side or the other during their campaign for election to the legislature, as the liquor question will be kept alive by the drys in their fight to put Wisconsin on the dry list. The governor in his veto charged that the bill was too sweeping, because it, among other things, forbade the operation of breweries even for export trade. The governor recommended the curtailment of sales of liquor containing more than 10 per cent of alcohol.

Of special interest to northern Wisconsin is the bill which carries with it an appropriation for the university experts to conduct land-clearing and demonstrational work in northern Wisconsin. The original appropriation was $37,250 for the next two years. The assembly in passing it added an amendment appropriating additional funds for this purpose. This money is to be applied on the work already begun and which has shown such splendid results. After passing the senate some time ago the bill was defeated by a few votes in the assembly recently, but through the motion for reconsideration of the vote it was brought before the assembly again and was finally passed. It now goes back to the senate for concurrence in the amendment and for enrollment. If nothing happens to it there, northern Wisconsin will be greatly aided in the work of making her acres fit for the plow.

Misinformation is at the bottom of most of the objections raised against the bill by the legislators. Northern Wisconsin's 10,000,000 acres of cut-over land, an agricultural kingdom in itself, needs the expert advice and the help that only trained men can give. The development of this land by the cheapest and most efficient method is highly important. There is no longer need for every stump to be grubbed in the old-fashioned, back-breaking way. Development in the twentieth century requires and should employ more modern methods. Necessary expenditures must be met by appropriations large enough to make substantial progress possible. It is the poor man who needs the help of the state. The well-to-do landowner not dependent upon the land for his first years of subsistence in northern Wisconsin can manage to take care of himself and his interests.

Private subscription made it possible last year to send a demonstrational train into northern Wisconsin to show the settlers how to get rid of the stumps. Cheaper methods of doing so were preached from every car door and they had immediate effect, because the advice was accompanied by demonstrations at every meeting. For the amount of money appropriated no better use could be made of it to assist northern settlers. It is another step towards speeding up development in northern Wisconsin.

A bill aiming to compensate farmers for losses sustained through the activities of beavers was killed last week. Under the state law the beavers are protected, though it has been frequently shown that dams built by them flood sections of the grain fields, causing considerable loss.

A bill giving aid to the Wisconsin Potato Growers' Association for developing potato work in Wisconsin has passed the assembly.

A great many bills are yet to be considered in both houses and it is likely that the legislature will be in session the entire month of June.

Death of Carl D. Livingston.

With very sincere regret The Wisconsin Farmer records the untimely death of Carl D. Livingston, assistant professor of agricultural engineering at the University of Wisconsin. Mr. Livingston died of malarial typhoid fever Thursday, May 24th. He contracted this fever while on a trip to New Orleans to address a land-clearing conference.

The deceased did conspicuous service in Wisconsin by arousing a statewide interest in land clearing. He had charge of two special trains, one over the Soo Line and the other over the North-Western Line in Upper Wisconsin last year. He was one of the best posted men in land-clearing methods in the United States, his ideas being copied quite generally in states where clearing timber land is considerable of a problem. Coming to Wisconsin from Washington, he was a worker in the forestry department, and his

CARL D. LIVINGSTON.

extraordinary ability was soon recognized by the faculty of the college of agriculture and he was given an associate professorship in agricultural engineering. The men and interests in Wisconsin determined to accomplish much in the way of land clearing this year and the next two or three years expected to place much dependence in Mr. Livingston, and his death is a distinct loss to the state. At the recent cut-over land conference in Eau Claire Mr. Livingston gave a comprehensive review of Wisconsin clearing problems, and men who have been giving these problems attention for years were amazed at his extraordinary grasp of this important subject.

The Wisconsin Farmer has been indebted to Mr. Livingston for a great deal of information on the subject of land clearng. Mr. Livingston was not only well posted in his chosen work, but he had the happy faculty of being a friend-maker and also the capacity to impart information to others so that they could make practical use of it.

The Best Farm Paper.

We are in receipt of hundreds of commendatory letters from subscribers every week in line with the following from a young reader of this paper:

I have been a reader of your paper ever since I have been old enough to read good. My father was a reader before me and is yet. I believe and know that your paper is the best farm journal I have ever seen.

This year promises to be the most useful The Wisconsin Farmer has ever enjoyed in its long career. This is the farm's year, as never before. That being the case, it is incumbent upon every farmer, who wishes to make the most of his exceptional opportunity, to take and to read regularly the most practical and reliable farm paper published in his territory. We firmly believe The Wisconsin Farmer is that paper, the one which he cannot and should not do without.

Attend to the important matter of your subscription renewal without delay. Induce as many friends and neighbors as possible to subscribe and thereby diffuse practical, dependable farm information generally throughout your locality. Never was there a year when a good farm paper was so indispensable to every farm home. We plan to make The Wisconsin Farmer more useful, more practical, more valuable to every member of the farm household this year than ever before.

Examination of Wisconsin Soils.

Quite frequently we receive letters from our readers asking whether it is possible to have their soil examined by the state, and if so what are the conditions and what is the fee. Mr. W. J. Geib, secretary and treasurer of the Wisconsin Soil Improvement Association, has written for The Wisconsin Farmer a comprehensive statement of this matter, which is as follows:

Through the state soils laboratory, the soils department of the college of agriculture is now able to make examinations of the soil on any tract of land in the state upon the application of the landowner. For this service a small fee is charged. The examination consists of making a careful study of this soil in the field, and collecting information concerning the methods which have been followed on the farm, the crops grown, methods of rotation, fertilization and cultivation. In the laboratory a chemical analysis and careful physical examination is made of the soil samples, and when this is completed a report is prepared for the farmer, outlining methods which the college considers best adapted to the permanent improvement of the soil on the farm examined.

Up to the present time about 660 farms have been examined in the state. These are distributed through sixty-three counties and about 210 different communities. In most cases applications come to us from groups of farmers ranging from five to fourteen or fifteen in number of individuals in group. We have about seventy-five such groups at the present time.

It is the desire of the soils department to keep in touch with these farmers and to aid them in carrying out recommendations which have been made. We receive reports from them here at the college from time to time and from these reports it is evident that the farmers are securing very satisfactory results from lines of improvements already started.

The Wisconsin Soil Improvement Association has been organized for the purpose of uniting these people who have had their soils examined, and others who may be interested in soil improvement, into a solid working unit. Through the Journal of Soil Improvement the experiences of various members of the organization will be conveyed to all others who may be interested in this line of work. We expect to form a local soil improvement association in practically all communities where we have made group examinations of farms. Up to the present time, however, only a few such clubs have actually been formed. The Christiana Club is one of the first. There is also one at Prairie du Chien.

The Soil Improvement Association, as you may know, is directed through the soils department of the college, although no state funds are used for it nor for the publication of the Journal. The soils department, however, will send a man to any community in the state where it is desired to have a soil improvement club formed. It is our purpose to urge all who are interested in soil improvement to join the state organization and thus secure the Journal of Soil Improvement. We believe that "In union there is strength," and wherever a group of farmers are united in their efforts to improve their soil they will be able to accomplish more than where each man is working independently. The college can render a greater service to a group of individuals than to scattered individuals. The college will assist in holding meetings in these various communities, and will render every service possible in advancing interests of permanent soil improvement.

Mr. Geib writes that he will be very glad to have the agricultural press of this state assist in the development of such soil improvement clubs in various communities. It is not necessary that soil examination should have been made in a community, for the college workers are glad to take up this work in any section where interest is shown.

FAMILY CIRCLE TALKS—By The Publisher.

(Continued on page 3.)

of the assets back of the bonds. The security being thus sound and ample, what of the interest rate the farmer-investor will receive, when must his bond payments be made, when will he receive his money back, and so on?

The Liberty bonds are to bear 3½ per cent interest, and being free from all taxation (even income tax) this means virtually a 4 per cent investment. Interest is to be paid semi-annually, June 15th and December 15th of each year. The bonds are to be issued in various denominations, $50, $100, $500, $1,000, and so on. They will mature June 15, 1947 (thirty years from now), but they may be redeemed on or after June 15, 1932 (fifteen years from now) at par and accrued interest on any interest day. Should the bonds run to maturity, it will thus be seen, the investor more than receives all his money back, in interest, in addition to the principal. Should they run the minimum limit, he receives half of his money back in the form of interest, in addition to the principal. Immediate payment of the entire amount of the bonds subscribed for is not demanded by Uncle Sam. Instead, every application for a bond must be accompanied by a 2 per cent deposit. Let me assume, to make it clearer that a farmer buys a $1,000 Liberty bond (his subscription for a $50 or $100 or $500 bond will be just as welcome, however). He must accompany his application with a check for $20. On June 28th of this year he must pay $180; on July 30th, $200; on August 15th, $300, and on August 30th, $300. He is thus given three months in which to raise the money, enabling him to buy the Liberty bonds on the proceeds of his hay and small-grain crops this year, if he does not wish to touch any of the $2,000,000,000 which the farmers of the grain belt had on deposit in the state and savings banks at the last available reports.

With the proceeds of this $2,000,000,000 bond issue the government is going to prosecute its share of the great war and finance its allies, who will spend practically all of their share right here with the people who are loaning the money to them, buying foodstuffs, clothing, live stock, war munitions, and so on. Virtually none of the money will be sent outside the country, the entire $2,000,000,000 will be put in circulation here at home, thus enhancing our already widespread and high prosperity.

But there is another side to this matter—the good, sound business sense of such a subscription having been established. That other side is the patriotic side. Our country needs money; it is going to fight against tyranny and militarism and a complete disregard of humanity's rights. Before it fights with human blood it is going to fight first with dollars. We must have money with which to raise and equip an army, which, should it be sent to Europe, will not be sacrificed in vain because of its weakness and inefficiency. The nations which are fighting our battles already over in Europe need money in order to feed and clothe their soldiers, in order to supply them with arms and ammunition. We must supply this money; we must fight with gold and silver, for a time, while our allies fight with powder and lead and steel. Every day that we withhold from Uncle Sam our dollars means another day, at least, added to the great war, means untold human lives sacrificed, means thousands of mothers crying for the boys who will not return, who might have returned had we done our duty promptly. Shall we bear this unnecessary burden of responsibility another day? Shall we not, rather, go forth to meet Uncle Sam, carrying in our hands the money which our fruitful fields have yielded to us, which we have been enabled to earn and to save by the stable, beneficent government which now asks us, not for a gift, but merely for a loan?

Farmers of the grain belt, it is up to you to prove your patriotism! I know you will not be found wanting. Drive to town today and see your local banker. Ask him if what I say here is not the truth; if the Liberty bonds are not a good business investment; if our beloved nation does not need your financial aid and mine, quickly, unanimously, wholeheartedly. If you find out that what I say is, indeed, the truth, rally to the support of Uncle Sam, of the stars and stripes, of liberty and of civilization, and by the signing of your name to a check and the purchase of a Liberty bond show that you are, indeed, a soldier fighting for truth and honor and righteousness among all men and all nations.

Buy a Liberty bond today. Let this be the slogan of all farmers, to the end that Uncle Sam may find that he has no more loyal, patriotic citizens than the men and women who till the soil. The eyes of the nation, of the world, are upon us. Shall they look and plead in vain?

James M. Pierce

FEEDING SHEEP AND HOGS.

Walworth County Man Has Been Making a Success of it and He Also Has a Holstein Herd Which Is Paying Good Dividends.

MR. C. H. WISWELL, of Elkhorn, Walworth county, had been farming a good many years before he began feeding sheep and hogs for market on the enormous scale he is doing now. The idea for enlarging his farm operations came to him many years ago, but it was a long while before he carried it out. It lacked definite form, and Mr. Wiswell never undertakes a proposition until he has worked out to his satisfaction every detail connected with it. So he carried the idea around with him and kept on farming.

One day he saw a self-feeder in use on a farm he was visiting and it just struck him that the idea could be applied to feeding operations on a large scale. The self-feeder he saw was only a small affair, but it was working satisfactorily. On a bigger scale it ought to do equally as well, thought Mr. Wiswell, and he added the information to his plan for future large scale feeding.

That was four years ago. Today the idea has been developed and carried out. About 2,500 sheep and 400 hogs are prepared for the market each year by Mr. Wiswell at a minimum expense of feed and labor. The self-feeders have been developed and perfected to an extent which cuts the labor cost in two. They are not the small affairs which gave Mr. Wiswell's idea a foothold. He has enlarged the model so that the smallest contains two and one-half tons of feed at a time and the largest a carload. Sixteen of these, containing various feeds, take care of the sheep and hogs on the place.

Mr. Wiswell does not undertake too much at one time. He likes to divide his operation, so that there will be work and cash returns the year around. So he feeds sheep in winter and hogs in summer.

He buys his sheep in October and continues buying until January. The sheep are fed until they weigh approximately seventy-five to eighty pounds, which is the right weight for market. By April the last of the sheep have been fed off and the barns are turned over to the hogs, about forty of which are kept on the farm the year around. From April until June other hogs are purchased and fattened for market purposes until September. Then all but a few brood sows are again sold out and things gotten in shape for the first shipment of sheep.

All the eggs are not in one basket, however, as Mr. Wiswell does not believe it a wise policy to depend entirely upon the feeding operations for his revenue. As a backbone to all his undertakings he has a herd of highly bred Holsteins. The combination assures him of a definite profit, irrespective of market conditions. He can at any time discontinue his feeding work and feel safe that the dairy end will pay the running expenses of the farm. He talks of the herd with a feeling of pride, for the cows have made it possible to carry on his other enterprises on such a large scale. He knows they stand ready to furnish additional profits should things turn topsy-turvy.

In feeding so many sheep, Mr. Wiswell has had to figure with every convenience possible in order to save time and labor. The three large buildings that accommodate the animals are built so as to permit free entrance of teams and wagons for filling the self-feeder and taking out the manure. The first shed is 32x112 and has a hayloft above for 100 tons of hay. The second shed is also 32x112, but has no hayloft overhead. A third shed, 36x128, contains a hayloft for better than 100 tons of hay and has a self-feeder along the north wall holding a carload and a litter of feed. In each of the barns are also the movable self-feeders, the smallest of which will hold two and one-half tons. In filling these the men drive through the barn and the feed is shoveled from the wagon into the bins.

For roughage the sheep get silage, alfalfa and clover hay. Of the hay the sheep are allowed to eat all they want, but of the silage about one and one-half bushels per day is figured for each twenty-five sheep. With the silage a little salt is fed daily, in order to keep the animals in good shape. There has never been any trouble from disease on the farm, either with sheep, cattle or hogs. Mr. Wiswell believes in feeding plenty of salt regularly and his hogs get, in addition to the salt, a daily dose of copperas in the slop.

For grain feed Mr. Wiswell purchases wheat screenings for the sheep and also feeds quite a little salvage grain during a season. He purchases feeds the year around, watching the markets for favorable prices.

The hogs are fed in self-feeder fashion and receive, besides tankage, salvage grain and ground screenings, a slop made up of a mixture of ground screenings, oil meal and salvage grain. Salt and copperas are added to each batch mixed. This mixture is soaked in an eight-barrel tank before each feed and flows into the trough without a second handling. The hogs have access to five acres of native grass, which gives them plenty of exercise and enough grass feed to keep the bowels moving. They are permitted to root in the sheep barns and go through the manure for what feed they can find.

Before self-feeders were installed, it required the time of one man for about five hours each day to take care of only 150 hogs kept at that time. Today one man puts in about three hours each day to take care of 400 hogs. The self-feeders require no attention, except occasional filling, which is done by shoveling the feed over from the bin located in the hog house.

The hog house proper is 24x36 and has besides the storage bin, running along one entire side, a tool house on the far end. The house is plenty large enough to accommodate the hogs kept over the winter, as during the summer months the sheep barns are open to the feeders.

The farm has about 200 acres of fertile farm land. A pasture of thirty-five acres gives grass for the cows and the balance is divided into corn, clover and alfalfa. Two silos on the place take care of about thirty acres of the corn raised. Mr. Wiswell is never in a hurry about planting his corn, for he has what he considers two early varieties that will mature even in the shortest season. His corn for grain purposes is Golden Glow, and for silage purposes he uses a strain of Flint corn, known around that neighborhood as Smut Nose. He has put in the silage corn as late as the 20th of June and had his silos filled before many of the neighbors' corn had even matured.

The large amount of manure produced by the stock on the farm has made the acres rich in fertilizing constituents. The entire farm receives a heavy application of manure every second year. Mr. Wiswell is a member of various county organizations and is interested in all movements for farm betterment.

Western Guernsey Meeting.

To the Editor:—The summer meeting of the Western Guernsey Breeders' Association will be held Wednesday, June 6, 1917, at the farm of Geo. McKerrow & Sons' Company, Pewaukee, Wisconsin. Pewaukee is on the main line of the C. M. & St. P. Railroad, twenty miles west of Milwaukee, and also on the interurban line running from Milwaukee to Oconomowoc.

The speakers for the day will be Mr. Robert Scoville, of New York, the newly elected president of the American Guernsey Cattle Club, and Prof. C. G. Hopkins, of the University of Illinois.

We are very fortunate indeed to secure the speakers that we have, and a cordial invitation is extended to every Guernsey breeder to be present.

At the annual meeting of this association held at Madison last February, committees were appointed to recommend rules for the standardization of dealings between buyer and seller and also recommend an amendment, to the American Guernsey Cattle Club, for the conducting of A. R. tests. These committees will report at this meeting.

The executive committee are going to recommend at this meeting that hereafter either the president or secretary of every local association, in the territory covered by the work of this association, be ex-officio a member of this association. I would, therefore, urge the officers of all local associations to attend this meeting.

The committee having under consideration the employment of a field man will also make a report at this meeting.

The Iowa Guernsey Breeders' Association will hold their meeting on June 5th at the farm of Grant Enlow, Fairfield, Iowa. Those who wish can attend that meeting and reach Pewaukee at 11:08 a. m. on June 6th, and this train will leave Chicago at 8:15 and Milwaukee at 10:25.

The Waukesha County Guernsey Breeders' Association will hold their summer sale at Waukesha on June 7th, and these two events coming on successive days should attract many visitors. Charles L. Hill, Sec.

Letter Carriers' Convention Postponed.

Pres. A. D. Larson, of the Wisconsin Rural Letter Carriers' Association, advises The Wisconsin Farmer that the convention announced to meet at Sturgeon Bay, Door county, May 30th and May 31st, has been postponed to some future date. Announcement of the date of the convention will be made later.

Our Farm Help Column.

The Wisconsin Farmer has received the following letters the past week from farmers who want help and men and women who want jobs on farms:

FARM HELP WANTED.

Henry Schorner, Defiance, Iowa. Girl wanted for general housework.

H. P. Jergenson, Thornton, Iowa, Route 1, Box 30, wants experienced man. Wages $15.

FARM JOBS WANTED.

Mrs. Mamie Lee, Clermont, Iowa, wants position as housekeeper on farm or ranch.

N. J. Hilstrand, Rice Lake, Wis. Wants job clearing timber or brush, preferably by contract.

Richard Peterson, Belmond, Iowa, wants job on farm where there is not much milking.

H. E. Bisshop, 214 N. 9th Street, Keokuk, Iowa. Wants position as traction engineer.

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 14.

Where Agriculture Is Popular.

Young Folks of the Medina High School, Marshall, Wisconsin, Are Interested in Farm Work—By Earl J. Cooper, Principal.

THE wide-awake agricultural high school must be of service to its community—especially at the present stage of the world's history. In order to make secondary agriculture a success, we must use practical and up-to-date methods. The high school boy is a keen thinker. Moreover, he must be given live material to work with, or his interest dies. The teacher has a splendid chance to help make a good farmer out of the boy and instill the idea of patriotic duty in his life.

THE SCHOOL GREENHOUSE SUPPLIES CABBAGE AND TOMATO PLANTS FOR THE FARMERS AROUND.

The Medina Agricultural High School, located at Marshall, Wisconsin, is not a large institution, but it supports a four-year course in agriculture and a complete course in domestic science and art. These subjects are practical and are made to appeal to the home side of life.

Agriculture is studied both from the classroom and laboratory standpoint. Each subject is taken up first in school. If the boys are studying "good dairy cattle," score card, book lessons, and bulletin illustrations are taken up. The class is then taken to a near-by dairy and asked to judge the herds. When possible, trips are taken to more distant points to get the best possible material.

In the garden and greenhouse work a greenhouse, several hotbeds and small gardens form the laboratory material. In the greenhouse shown, enough cabbage and tomato plants are raised to supply the country 'round. In fact, the people depend upon this supply year after year.

EARL J. COOPER, MARSHALL, WIS., PRINCIPAL MEDINA HIGH SCHOOL.

Spraying and pruning can best be taught by actual work. The boys are taking care of several orchards, in order that they may learn by actual experience.

We find that boys do the best work if they own some of the material. Three months ago five boys purchased a high-grade Holstein heifer, Medina Lassie. Their problem is to feed her the best and cheapest ration and fit her for the fall fairs. A note was given for her which is to be paid when she is sold. The weekly gains are noted and she has proven to be a gainer so far. Every boy has added a fine experience to his school life.

A large number of boys have adopted pigs and chickens. There are over ten pigs now being owned by high school boys, and during the last two weeks nearly 200 chicks have been hatched "to help win the war." These animals will also be shown at the fall high school and county fairs. Eight boys have bought calves from their fathers and are taking entire care of the same. Others have taken over the home gardens; some chose the home orchard as an ideal project, while others have undertaken to test their herds. Every boy is busy.

MEDINA LASSIE, OWNED BY THE HIGH SCHOOL BOYS.

We have undertaken some extension work which has met with success. In connection with our school, the district schools in two townships have been organized into agricultural clubs. The country boys and girls are raising calves, pigs, chickens, vegetables, corn, or potatoes. The products are to be exhibited next fall at the Marshall High School fair, where suitable prizes will be given, both for the best individual work and for the school as a whole. In addition, the children have a chance to exhibit at other fairs and compete for state prizes offered. We know that this work has a definite value. It creates a love for the farm and no doubt will induce more to attend high school.

The Medina high school has helped to put on farmers', women's and childrens' institutes. The latter was the first of its kind to be held in Wisconsin in connection with a farmers' institute and attracted over eighty children from five schools. As a result of these institutes, club work was started and a cow-testing association formed.

During the past winter members of our faculty and members of the school have helped to organize four social centers—three in the country. These centers have been great social uplifts on long winter nights and will be repeated next year with, we hope, even better success.

We are finishing up the year by visits to all the neighboring country schools, wishing them a prosperous summer and strongly advising a further education in the Medina High School.

INTELLIGENT people have a way of sizing things up for themselves—W-B CUT is all shreds, all tobacco; and ordinary plug is leaf with a lot of heavy, gummy sweetening, holding it together. But everything doesn't go by quantity either; W-B CUT is a rich, sappy chew, because it's *rich, sappy* tobacco. It doesn't take so much W-B to satisfy. Take a small *chew*. Then notice how it *lasts*.

What the Naples Club Has Done.

Farmers in the Vicinity of Mondovi, Buffalo County, Have Accomplished a Great Deal Through Their Club.

To the Editor:—The Naples Social Club, which was organized in October, 1914, by the rural school-teacher and myself, has turned out to be one of the most successful farmers' clubs in Wisconsin. During the first year we did not do much in the line of buying or selling, or doing much for the community, only in the way of having programs, but during the last two years we have through our united influence bettered the community in many ways. We have improved the social conditions for the young people by giving them some place to go and giving them some responsibility besides giving them a good training in music and reading, and they are now able to appear before an audience without being afraid. We have organized a tennis club, a community Sunday school and a Y. M. C. A. The club has bought, during the past six months, one car of crushed lime rock, thirty-five bushels of certified seed potatoes and enough of the spraying chemicals to spray their potatoes for late blight and potato bugs. We are planning on holding our annual summer picnic June 5th. We are also planning on having a canning institute in August. At the present time the club is conducting a sparrow, gopher, and crow-killing contest.

FARMERS' CLUB CONVENTION HELD RECENTLY AT MONDOVI, WIS.

We expect to have a grain and potato exhibit next September, so you see we are planning on doing quite a bit of work the next few months. We hold our meetings in the rural schoolhouse once a month and find that is often enough. Our present membership is over fifty, and we usually have more at the meetings.

The present officers of the club are president, Paul Hanson; vice president, Mabel Koepp; secretary, Myrtle Paulson; treasurer, Helmer Amundson.

H. G. Seyforth.

In Langlade County.

To the Editor:—The Kempster Farms Club did not meet often during the past winter. Our situation here is contrary to that of most clubs in that the winter season is a very dull one in this county. Most of our men are gone to the woods and can't attend club meetings. We held some neighborhood or community meetings at the schoolhouse under the leadership of the teacher. We hope soon to reorganize our club here, and if we do, will be glad to send you a report of some of our interesting meetings.

Russell Knight,

Correspondent, Kempster Farms Club, Langlade county, Wis.

Lunch at Each Meeting.

To the Editor:—We disbanded the St. Croix Falls Club about a year ago and now have a club of a little different character which meets once a month with a membership fee of only 25 cents a year, and the only expense besides this entrance fee is the cost of entertainment. We meet once a month with lunch, which falls upon one member each month. Our new club meets the second Saturday afternoon of each month. So far our county agent has been able to be present at each gathering. Our new officers are Geo. J. Juie, president; Mrs. S. R. Powell, vice president; W. A. Larson, secretary and treasurer.

Polk Co., Wis. Conrad Johnson.

The 20th Century Farm Horse

Actual photo of three 20th Century Farm Horses on the farm of T. W. Miekljohn, near Fond-du-Lac.

Tractor Unit complete which bolts to rear end of Ford frame after Ford wheels have been removed.

Tractor Wheels. Heavy 36-inch Tractor Wheels equipped with angle iron lugs for field work.

Giddings & Lewis, (patented) Positive Circulating Water-Pump. Attaches to left side of Ford motor in place of straight thermo-syphon water inlet pipe

Auxiliary Water Tank. This 10 gallon water tank attaches to left front fender bracket of Ford car.

Driving Gear Segement made from chilled semi steel and bolted to inside of Tractor Wheels. Each of the 8 segements interchangeable.

Driving Pinion. showing high carbon steel rollers which mesh with tractor wheel driving gear segements

A Stronger, Better Farm Tractor
At a Much Lower Cost

A stronger, more durable Attachment for Ford car, which makes a tractor that will do as much work as any high-priced tractor, and operate at much lower cost. The 20th Century Farm Horse is made stronger, of better materials and along more perfect mechanical lines. There is no more wear on Ford engine and transmission than when the Ford is used as a pleasure car.

Quickly and More Easily Attached

The 20th Century Farm Horse can be attached to any Ford car in a few hours. Anyone can attach it. No troublesome change of radiator is necessary; as the patented water circulating pump that is furnished keeps the Ford engine cooler than *merely a larger radiator.* A ten-gallon auxiliary water tank is attached to the left front fender bracket giving ample supply of water under every condition of weather and service. Can be easily changed back to a pleasure car when the plowing season is over.

Does the Work of Four Horses

The 20th Century Farm Horse will do the work of two teams — four good horses. Will go where horses and other tractors cannot. A light tractor does not pack or sink into the ground and its short wheelbase enables it to turn short. Operating cost stops when the Ford motor stops. Does not eat its head off in winter like horses in the barn. Can be used for night plowing with the regular Ford Lighting System. Plows five to six acres a day, in any soil, while horses can plow only three.

Price $150

With Pump and Auxiliary Water Tank

This price places the 20th Century Farm Horse within the reach of every farmer. It is built by a company which has been manufacturing high grade machinery and tools since 1857. Large production facilities and unlimited resources permit this company to sell this high grade Tractor Attachment at this amazingly low price.

Don't Delay Writing for Information

In spite of very much larger production facilities which are now under way it is almost certain there will be a shortage of these Attachments later in the season. Don't delay and be compelled to buy an inferior Attachment. Write today for illustrated literature showing what the 20th Century Farm Horse will do on *your* farm.

Farm Tractor Company
100-200 Doty St., Fond-du-Lac, Wis.

DEALERS Automobile Dealers, Implement Dealers and Live Farmers:—There is big money to be made in selling tractors. Now is the time to get in this profitable business. The 20th Century Farm Horse Attachment, on account of low price and superior construction, offers you a bigger opportunity than any other Tractor Attachment. The company behind it is of unquestioned financial strength and backs up the sales efforts of its dealers with the heartiest co-operation, *and strong advertising.*

Write or wire for liberal Dealer's Plan or come to Fond-du-Lac and see us.

Huge factory where 20th Century Farm Horse Attachments are made. Established in 1857.

DAIRY

Number of Scrub Bulls Astonishing.

To the Editor:—On May 13th we completed the first month's work in the Monticello Cow-Testing Association with 611 cows tested for that month. A little over 700 cows are enrolled for the year's work, which puts us in a position where we can rightly claim that this is one of the largest and best associations of its kind in the state.

This one month's testing has shown that from its results several lessons can be learned.

First. The good looking cow is not always the best producer and the poor looking cow is oftener the best producer.

Second. It proved that the Babcock test is the only method by which the actual per cent of butter fat can be determined. Several members had cows picked out that they thought had the richest milk. Eight times out of ten their "guesses" were wrong and often the cow they didn't even consider proved to have the richest milk.

Third. In some herds there were two generations to test. Several of them showed that the daughters were poorer producers than their dams, indicating that their sire came from poor stock. It is astonishing to see the number of scrub pure-bred bulls there are in the country. Scores of farmers look for a bull that is cheap and always buy an inferior bull first, even if they have the chance to get a good one for $50 to $100 more.

Look around you and in every case you will find that the dairyman that has the goods has used good sires and has placed quality before price.

This month we have forty cows in the association that produced over forty pounds of butter fat. Of these forty, twenty-three are pure-bred Holsteins, thus showing the superiority of the pure bred over the grade. However, there are also scrub pure breds, and dairymen must be careful what they buy, or they may get a cow that is pure bred in name only.

Baltz Hoesly ran away with most of the honors, capturing the first seven places with some of his high producers. He has eleven cows in the list. His best cow, Minnehaha De Kol 3d, produced 2,253 pounds of milk and 80.2 pounds of butter fat. She averaged over seventy-five pounds of milk a day and made a very creditable record for herself and her owner.

Ernest Strahm has the best producing grade cow. She produced 58.1 pounds of butter fat in the month. Stauffacher Bros., however, have the heaviest milking grade cow. In thirty days she produced 1,629 pounds of milk, averaging 54.3 pounds of milk per day.

SILO AFTER A BAD FIRE.
This vitrified tile silo with steel hip-roof and chute was in the midst of a big fire on the Joseph Witgen farm, Fowler, Mich.

In summarizing the results it may be said that at present the cows in this community are excellent animals and that there are here many animals that are as good, if not better, than others elsewhere. The only trouble is that most of the cows here have never been tested and their owners do not know their real productive capacity.

Below is the list of all cows producing forty-five or more pounds of butter fat for the month ending May 13, 1917:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat
Baltz Hoesly					
Minnehaha De Kol 3d, R. H.	7	Apr.	2253	3.56	80.2

Alvin W. Wardas, Official Tester.

Door County Annual Report.

To the Editor:—The first year of the Door County Cow-Testing Association closed May 1st. A larger organization is now being formed with about 500 cows. In the year just closed about 20 per cent of the cows of the association was sold to the butcher, having been shown by test to be unprofitable. Some cows, which were considered to be poor milkers, showed up very well in the test. The herds of all members have been put on a paying basis. The yearly record shows the number of cows in the 365-pound class—that is, a pound of fat a day. The highest butter-fat production for the year was made by a grade Brown Swiss, owned by L. H. Klemke, and her production was 455 pounds. The records show that it costs an average of $42.61 to feed each cow for a year. A considerable amount of feed was purchased in quantities by the association, keeping the cost down. The average profit per cow for the year was $52.96. For every dollar put into feed the actual return realized was $2.29. The following figures will also be of interest:

The average milk flow per cow for the year—5,778 pounds.
The average test—4 per cent.
The average gross income—$95.57.
The average roughage bill—$25.48.
The average grain bill—$17.13.
The average price of butter fat—41.6.
The average butter production—231 pounds.
The average cost of butter fat per pound—18.5.

The following table shows the returns made by the herds of six members of the association:

	No. cows	Lbs. milk	Lbs. fat	Feed bill	Profit
H. Neuvile	10	8437	326	$61.52	$74.36
Fred Ash	6	5919	315	54.41	72.89
Pat Hogan	10	7837	304	45.59	82.68
L. Klemke	13	7166	302	56.76	70.00
Will Voeks	10	6375	258	52.73	51.22
N. Thiel	10	7090	256	41.25	65.21

The weather holding out fair for several days permitted the farmers in this section to do their early seeding. Up to the 20th of May there was a general shortage of feed, many farmers buying hay at $15 per ton. Bran cost $50 per ton, hence the farmers outside of the association were not feeding grain and were anxiously waiting for a warm rain to boom the grass. Clover and alfalfa are doing fine. A large cherry crop is expected in this section.

George Thull, Official Tester.

WHIRLWIND SILO FILLER

TO OWN an ensilage cutter is to get the limit of food value from your silo crop, and maximum storage capacity from your silo. To own a Whirlwind is to possess silo filler perfection. A wonderfully fast and dependable machine—based on mechanical principles that speak for themselves.

The Whirlwind is simplicity itself. Five sizes, 3 to 40 tons hourly with 3 to 22 H. P. gasoline engine. Plain or traveling feed tables. Three styles of mounting. Every piece of cast metal used in Whirlwind construction is semi-steel and thoroughly tested prior to its acceptance as a Whirlwind part. Heaviest Cutter and Blower wheel on any filler makes for even cutting and the absolute safety coming from uniform centrifugal strain. Better investigate. Look before you leap. Get our free catalog and book: "Why and How of Silo Filling."

Our agent's "Weekly Bulletin" has much inside information. Your name will be put on our regular mailing list if requested today.

Wilder-Strong Implement Co.
Box P
Monroe, Mich.

The President Says:

"It is of the most imperative importance that everything possible be done and done immediately to make sure of large harvests."

Conserve and Increase Your Forage Crops

Turn under part of your pasture and plant it to saleable crops. Feed your stock cheaper, easier, more profitably with a few acres of corn cut into ensilage with a Kalamazoo Ensilage Cutter and stored in a Kalamazoo silo. Stop wasting land that should be used for money crops. This year, if ever, farmers have a chance to make *big profits.*

Kalamazoo LIFE-TIME-SILOS

are built to meet the exacting farmer's needs. Best in design, material and workmanship. Have every desirable feature a silo should have and embody the "know how" acquired through more than twenty years experience in silo building.

Glazed Tile Silos—fire-proof, frost-proof, storm-proof, decay-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. First cost is the last cost—a written guarantee goes with every one.

Wood Stave Silos—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos are made with Galvanized Steel Door Frames and continuous doors, forming a safe ladder entire height of silo.

Write today for our free descriptive booklet. If interested in an Ensilage Cutter, ask for Kalamazoo Cutter catalog. *Easy Payments,* if you wish.

KALAMAZOO TANK & SILO COMPANY Dept. 211 Kalamazoo, Mich.

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood.*

Guaranteed for 20 Years

"*But Lasts a Lifetime*"

The patented wood "tire" is built up of inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

PREVENT DEATH AMONG CALVES

Caffatone—the Dairyman's preventative and remedy for scours, positively stops scours in calves and colts inside of 3 hours without binding. Caffatone is harmless—given to weak and delicate animals. Many calves are born with scours. Protect yourself now—have Caffatone on hand—often there is no time to get Caffatone after scours is discovered although we send immediately by parcel post. Caffatone keeps indefinitely—packed in gelatine case—15 tablets to box together with full directions. Results are guaranteed—Caffatone gives widest endorsement by many users. Money back guarantee card accompanies all orders—tear out ad—send us name of druggist—Pin $1.00 bill to letter. Protect your calves by mailing order today.

CAFFATONE REMEDY CO.
303 E. Main St., Platteville, Wis.

25 CENTS Calf Rennets

We pay 25c for salted Rennets from milk-fed calves if handled according to directions. The Marschall Dairy Laboratory, Madison, Wis.

Badger Live Stock Doing Well.

Cattle in Good Condition in Spite of Feed Shortage--Milk Cows Normal in Number, But Hogs are Scarce--Grass Growing Slowly--Small Grains Look Well.

WISCONSIN.

Barron County.—Weather has been cold and dry, but a few light rains have fallen. About half the corn is planted and the acreage is larger than last year. No increase in the acreage of potatoes is apparent. Oats are about normal, but there was more barley and wheat planted this spring than for several years. The area in gardens is also greater than usual. Pigs and hogs are fewer than last year, but there is an increase in the number and quality of dairy cattle. Feed is scarce, although grass is starting.—Wm. Bartlett.

Buffalo County.—Small grain looks well. Clover and alfalfa are doing well, but got a late start because of the cold weather. Pastures are coming along nicely at this time. Corn planting is well under way and some farmers have already finished. There will not be much increase in farm production this year because of the shortage of farm labor. The number of young calves and pigs is about normal. More gardens will be planted this year than last. Many people in cities and villages are planting gardens in vacant lots and in some places lawns will be plowed up.—Jas G. Bates.

Burnett County.—Crops are making slow progress. However, small grain, especially wheat, seems to be stooling well in spite of cold weather. The acreage of spring wheat is larger than last year. More corn and potatoes will be planted this year than last. Silo building has received a stimulus and more farmers are striving to improve their dairy herds. There seems to be less young stock than last year, but more cows. Hogs are below normal in number and pigs are very scarce.—A. G. Peterson.

Chippewa County.—Weather has been dry with very little rain. Crops are in good condition, however. The acreage of potatoes will be smaller than usual. Corn will be about normal. A good deal of vacant land such as city lots, rural highways and roadsides will be put in crops. Live stock are in good condition. Hay has been set back on account of dry weather. Pastures are very short.—Ernest Neitzel.

Crawford County.—The weather is fine at present. Small grain looks well. Corn planting has commenced and will be finished in about two weeks. There will be more corn and small grain this year than last, but less hay. Hay on old meadows will make a small crop because of the dry weather. Prospects for fruit and vegetables are very good. Few cattle are on feed because most of the farmers in this section are in the dairy business.—Geo. Ashbacher.

Dunn County.—Weather has been cold and dry. Pastures are growing, but grain has been delayed. Dairying is the great industry in this section and is increasing rapidly all the time. Cow-testing associations have been established in the county and the standard of the herds is being improved. Many hogs will be raised this year. Corn planting is under way.—E. A. Finley.

Eau Claire County.—There is a shortage of all kinds of live stock. Many cows are being sold and shipped out of this part of the county and also considerable young stock. Hogs are scarce and few pigs are being raised. Most of the young pigs from last fall were sold because of the scarcity of feed. Brood sows did not do well this year. About 20 per cent more corn is being planted this spring than usual. Oats and barley need rain. Some new seeding is growing well, but in general pastures and meadows are only fair. Warmer weather is needed.—C. A. Koll.

Forest County.—The condition of small grains is excellent, although they are somewhat late. There is an increase of about 10 per cent in the acreage and since the last rain prospects are favorable for 90 per cent of a crop. Vegetables and fruit are doing well. Since the spring rains and warm weather, pastures are beginning to grow and cattle are improving. This has been an ideal spring for a good crop of young pigs and calves. Farmers are planting twice as many potatoes as usual wherever the seed can be obtained. A good crop of corn will be planted this week and many silos will go up. Considerable credit is due to the committee of defense in this county for the effort to increase food production.—H. H. Kahn.

Grant County.—Small grain is not doing well because the weather has not been favorable. Meadows and pastures are slow in starting. Gardens look fair. From all indications the fruit supply will be good. Young stock are above normal. Farmers are putting in a good deal more corn and small grains this year than ever before. The weather is cold and rainfall plentiful.—Al Vesperman.

Green Lake County.—Warm weather and recent showers have started growth. However, all vegetation is backward, especially the late sown grain. The surface of the ground was hard so that it had difficulty in coming through. In general live stock are doing well. There seems to be a small increase in the number of dairy cattle and more farmers are patronizing cheese factories. The pig crop is about normal. More potatoes will be planted this year than last. Prospects promise a good crop of early apples, but the late varieties are poor.—G. B. W.

Iron County.—Weather is cold and dry. Pastures and meadows are in poor condition. Very little grain has been sown up to date. Live stock look well. There are more milk cows than formerly and the number of contracts with the creamery have been increased. The acreage of potatoes will be about 25 per cent larger this season than last.—J. A. Beckey.

Juneau County.—The dairy industry is steadily growing. A number of pure-bred herds have been established and their success is assured. The growing season began late, but everything is coming on well now since the recent rains. Corn planting has just started.—J. H. McNown.

Kenosha County.—Small grain is up. A big acreage of spring wheat and barley was sown. Most of the clover winterkilled. Meadows as well as grain, need rain. There is a big increase in the acreage of potatoes and beans. Most of the sugar beets have been sown and are in fine condition. Cabbage plants are doing well. Corn planting is well under way. The seed is scarce. Dairy cattle are in good condition, but feed is not plentiful. Young stock wintered fine. The new crop of calves is doing nicely and is larger in number than usual. Hogs are below normal in number: little pigs are in great demand. Horses are not plentiful and quite a few farmers have purchased tractors.—Geo. Kreuscher.

Kewanee County.—Warm weather with recent rains has started the grain crops and grasses. The percentage of cattle on pastures is small. There are more heifer calves this spring than usual. Dairy cows are thin, but are in good health. Every vacant lot and corner on the farm or in the city is being planted to gardens. Farmers are preparing a large acreage of corn, but little planting has been done so far.—Fred Lutz.

La Crosse County.—Much live stock was sold last winter on account of high prices and the shortage of feed, but dairy herds have been kept up to the usual number. Cows have been sold at very good prices and the market for dairy products has held quite steady. Most of the stock is already on pasture. Hogs are very scarce and in some instances farmers have sold off their breeding stock. Six weeks old pigs are selling for from $5 to $6 apiece. The corn acreage appears to be somewhat greater than last year, but that of small grains is not more than normal.—S. J. D.

Polk County.—Pastures are improving and the milk flow is increasing rapidly. Live stock are not in as good condition as usual. Silage-fed cattle seem to be in better shape than those fed on mill feed. Young calves are doing well and most of the heifers will be kept for breeding purposes. The pig crop will be only 50 or 60 per cent normal, as a large number of spring pigs were lost. The lamb crop is good. Winter grains look fine and spring grains are coming along in good condition. Meadows are a little late. A large acreage of potatoes has been planted and there will be larger areas of beans and buckwheat than usual.—Wallace Fountain.

Price County.—Three weeks of dry weather has left pastures in poor condition and cows that have freshened will not get enough grass. The high price of butter fat makes it profitable for farmers to feed bran and middlings. All live stock are in poor condition, but will improve with better pastures. Spring pigs are selling at $10 a pair and there are not enough to supply the demand at this price. Farmers who failed to get their seeding done in April have a poor show for a good crop. Most everyone is making a special effort to raise a big crop, but the main handicap is dry, hot weather.—J. W. Fox.

Richland County.—Cattle are not doing as well as they should because of the cold, backward spring and short

(Concluded on page 17.)

E-B (Emerson) Buggy

Emerson vehicles have always maintained a supreme standard in style and durability. For example, the Ideal Top does not have the cumbersome braces which mar the appearance of the usual buggy, yet anyone may lower the Ideal Top without reaching outside. Other good features are Over-Lapping Seat Risers, Oval Corner Irons, the Water Bead and Oval Step Bar. Write for catalog. Look for the E-B Trademark. It's our pledge and your guide to quality. Write for E-B literature.

The BURN-OIL FOR FORDS and Two Hours Time

and YOUR FORD burns 8¢ KEROSENE

It's a miser for saving and a midget in cost

It is easy to attach; guaranteed to run a Ford car as many or more miles on a gallon of kerosene as on a gallon of gasoline.

And the Proofs Keep Piling Up

Mossville, Ill., May 16, 1917.

The Burn-Oil Device Co., Peoria, Ill.

Dear Sirs:—The Burn-Oil Device I got from you is proving to be all that I had ever dared hope it would be, both in cutting expense and getting the mileage.

I used to get eighteen to twenty miles from a gallon of gasoline, and now I am getting from thirty-three to thirty-five miles on a gallon of cheap kerosene.

My car runs and pulls just as good as it ever did on gasoline. I do not think it is any harder on the motor than gasoline, as my motor doesn't use any more water than with gasoline.

Wishing you every success, I remain as ever, Yours truly, VICTOR THOME.

You go just as far for less than half as much

No new carburetor required.
Nothing to get out of order.
Simple in construction.
Positive in operation.
Lasts the life of any car.

Run your Tractor-Fords on cheap Kerosene.
This attachment insures your motor running cool, quiet and efficiently.

Price complete for full attachment, $30.00

WAIT Don't pay double prices for Your Separator!

LEARN HOW GALLOWAY PROTECTS YOU WITH PATRIOTIC PRICES—ACT QUICK!

The farmer is being hit harder than ever by higher prices. But my savings on Separators prove you don't have to pay double prices.

Write for my FREE BOOK and get the facts

COMPARE! That's the True Test of My New Sanitary

No Separator made at any price will skim any closer, run any easier, or last any longer than my newest Sanitary model. Tests by thousands of farmers have proved it. Remember, a high price Separator doesn't mean the best. I'll tell you where the extra money goes—the difference between my low price and the cost of other high grade machines. Just send for my book and read my Separator secrets and learn all about Separators. I'll tell you why and how much you save when you buy your separator direct from Galloway. I'll prove how this direct buying saves about half on the highest class machine and the balance stays in your pocket.

Sold on Trial for 180 Milkings

Take nobody's word. Try it for 90 days yourself. Then if it isn't just what I claim—ship it right back. I'll pay the freight both ways and refund your money. Its clean, perfect skimming will astonish you. You will marvel at the ease with which you can operate and clean it. Every part is rounded—no sharp corners for dirt to gather. It runs true in perfect alignment—always—because one casting—the gear case—supports all the gear shaft and both bowl-spindle bearings. The entire gearing has but two high-carbon steel shafts—equipped with long, perfect fitted bearings. All working parts run in constant oil spray. Separating discs separate entirely from each other for washing. Every drop of milk gets full skimming force of the bowl. Milk is so distributed that each disc gets its full share to skim.

Read This!

Gentlemen: Your Galloway Sanitary Cream Separator which I ordered of you is much easier running and more easily cleaned than the separators which I had just worn out. And besides we have made a saving of $23. I would not exchange it for any of the high priced separators on the market.—Ebb. F. Louthan, R. 6, Carthage, Mo.

Let me give you the name of some one near you where you can see the Galloway

Time Table For Fruits and Vegetables.

To aid those who are planning to can a variety of products this year a table showing the length of time required for scalding, blanching and sterilizing fruits and vegetables is here given. This schedule is based upon the one-quart pack and upon freshly picked products. Five pounds of steam pressure is sufficient for processing fruits in steam pressure canners, and fifteen pounds for vegetables and meats. It would be a good idea to clip out the table, paste it to a cardboard and have it handy when canning time comes:

PRODUCTS	Scald or blanch	Hot water bath outfits at 212 degrees	Water-seal outfits at 214 degrees	Steam pressure 5 to 10 lbs.	Pressure cooker 10 to 15 lbs.

Use Care in Selection of Kitchen Utensils.

Kitchen utensils should be durable, of smooth finish, easily cleaned and suited to the purpose for which they are intended.

Much time is lost and fuel wasted as a result of choosing the wrong utensils for cooking. Tin makes a satisfactory utensil for most quick baking processes, as it is light weight and heats and cools rapidly. The best grade is the heavy block tin. Pure tin is soft and pliable and consequently iron or steel often is used as a foundation. If this foundation material is exposed by scraping or scratching the utensil, rust will attack the iron.

Enamel, agate and granite ware are made on iron or steel foundations. Should the enameling material become chipped the iron body soon will rust. Often utensils of inferior quality are sold as bargains and soon chip and rust. The pure white, and the blue and white enamel wares are not suited for cooking processes where high temperatures are necessary. The gray and the brown varieties are much more durable.

Aluminum is attractive and of light weight. There is no danger of chipping or rusting with this material. It is desirable for many processes of cooking, as it heats rapidly. Iron is used for processes of cookery where a high temperature is necessary. It is durable if kept dry and free from rust. When not in use it should be coated with saltless grease to protect it. Earthenware is used for long, slow cooking or baking processes. The lids of earthen baking dishes should fit tight to keep in all moisture and heat.

Cooking utensils made of glass are attractive, easy to clean and sanitary. Such utensils have proved successful for baking processes when made of a material which can be subjected to high temperatures with no injurious effects.

When selecting cooking utensils, choose articles with smooth finished rims and made of one piece of metal. Avoid seams and useless curves as well as dirt-catching handles. A heat-resisting wood makes the best handle.

Utensils should never be bought until needed. Select articles of many general uses and few specific. There is no reason why a kitchen should have all utensils of one ware. Always consider the use and durability when selecting.—[Rebecca Bartholomew.

Pickles Roasting Ears.

To the Editor:—I have been a reader of the Home department for nearly a year and I see so many helpful things that I want to send a few ideas of my own.

I made a rag rug, crocheted hit and miss, with some bright colors (red, white, blue, green and some black) and some pale or dull colors. Everyone thinks it is nice. I made it long.

The lady who wishes to curl her ostrich tip can do so by holding it over the top of the teakettle while the water is boiling, using a dull instrument to curl if necessary. Good tips curl easily.

Canning and pickling time is drawing near and I want to tell the readers how I have pickled white field roasting ears. I cut the corn from the cob and prepare it the same as kraut. It has to be soaked out, of course, before cooking. You will find the corn very good fixed this way.

I have a good buttermilk pie recipe, too, that I am going to pass along. I use two tablespoonfuls of flour and one-half teacupful of sugar mixed with one-fourth pint good buttermilk. Then I add three-fourths pint more fresh buttermilk, let it come to a boil, and add a tiny pinch of soda. Bake in one crust, and frost. I add lemon flavoring to both the custard and the frosting. The frosting is made a delicate brown by setting back in the oven a few moments. Mrs. J. W.

Schooling Begins at Home.

To the Editor:—I was much interested in the subject, "Two Kinds of Schooling," and I think our most important schooling begins at home, or before our 'teen age, where we should be allowed to think and do our own reasoning. I remember when I was at home my mother took our older brother into her confidence in her business affairs and if my younger brother or I ventured to express our opinions we were promptly "called down" and told that older and more experienced minds understood better how to manage. We tried to keep still, but we had read others' opinions and had talked affairs over and thought we had a right to speak because we worked, too.

So when we started out for ourselves we hardly felt free to express our opinions because we had been cowed at home. I remember when I was first married my companion asked me my views about different things that came up. For awhile I had none to offer, but finally began to feel my liberty and to realize now, too late for my good, that my education on some subjects did not do me much good. My mind had not been given a chance to develop along lines in which I was interested at an early age. I was needed at home, so I stayed and worked for my board and clothes until over thirty.

I think we should draw out the children's minds by allowing them to express themselves, and if they have ideas worth while (which most all do on some subjects) we should put those ideas into use, or let the children. If given this freedom they will have larger ideas, they will enjoy their education more, and will try to get more schooling.

Not taking the children into your confidence, along with allowing them to raise a pig, calf or colt or poultry, then selling it and keeping the money, has driven many a boy and girl from home and school.

As for the school itself, I think country school-teachers are far better for country schools than town teachers. Our children have attended both town and country schools, as I did. You would be surprised what foolish things some city teachers say, in agriculture, for instance. That is the one reason I am opposed to consolidated schools. Such schools are so crowded the teachers do not have time to explain. Mrs. J. W. Jesse.

Boiling Salt Water For Pickles.

To the Editor:—I recently sent you a recipe for sweet cucumber pickles and I notice that someone wants more information about making them. The recipe should have said to soak in boiling salt water instead of water alone. I am glad to correct this mistake and hope this lady will have good luck with her pickles. Mrs. C. J. W.

To Clean Lard Barrels.

To the Editor:—One of the readers asked how to clean lard barrels so they could be used for pickles and kraut. I have had good success with the following method: Take hot water and lye and wash the barrel two or three times with this, then scald it thoroughly and it will be ready for use. Mrs. Olive Schoenfeld.

Floor Covering For Small Room.

To the Editor:—A good covering for the floor of a small room can be made as follows: Put a covering of newspapers on the floor about one-half inch in thickness. Be sure they are smooth and even. Then take carpet paper, building paper or heavy wrapping paper and cut it into the required lengths. Paste each strip down, joining the seams carefully, and tack the edges close to the baseboard. When it has become firm and trodden down, paint it with two coats of good floor paint.

This floor covering has been used in a small bedroom over a year and has proven satisfactory. It is warm and durable and can be kept clean by wiping with a dry or damp cloth. Clara Larson.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Arbor Day at School.

Dear Young Folks:—As I have not written to your page before I am going to send a letter. I am thirteen years old and am in the sixth grade. We do not have a very large school. Sometimes there are only two scholars left after the last recess. I have three brothers and one sister. I am the oldest of the family.

I am going to tell you about our Arbor Day. First, in the morning one of my schoolmates and I washed the windows. When we got through with that I helped some of the smaller ones scrub the desks. We put all the desks in order and cleaned up our teacher's desk, too. Then there wasn't anything else I could do in the schoolhouse, so I helped rake the yard. We raked it all up in a pile, then one of the boys lit it. Then one had to stand near and keep the fire from spreading. It was nearly eleven o'clock when we got through with that. We played knife awhile and then went into the schoolhouse. They had the floor nearly mopped. It was nearly twelve o'clock when we got through with all the work. At noon we ate our dinner and we were glad, too, because we were very hungry.

After dinner we went out to pick flowers. We followed a cow path for a ways, then we crossed a ditch. We had a hard time getting all the little children across, but we managed it some way. When we got to the river there was a large tree across it and all the boys but two crossed over to the other side. There were many pretty flowers on that side, such as Dutchman's breeches, adder tongues and bloodroots. We walked along the river bank for a long ways. There were several trees across the river and the boys crossed back and forth on them. The teacher and the rest of the scholars picked flowers. We followed the river until we came out a little way back of our schoolhouse.

When we got back to the schoolhouse we planted some flowers and one tree. Then we played a few games and went home. —Esther.

Flower Riddles.

Dear Young Folks:—I like to read our page very much and think this a pretty good paper.

Have you girls planted your flower seeds yet? I have, and have some pansies in bloom. I love to plant and take care of them.

My thirteen-year-old brother is raising potatoes this year. Last year he sold about twenty bushels.

Here are some flower riddles I wonder if you can guess:

1. What flower begs to be remembered?
2. What flower is the preacher of all flowers?
3. What flower tells the time of day?
4. What flower is worn on the foot?
5. What flower is a color?
6. What flower is a ferocious animal?
7. What flower greets the new-born day?
8. What flower is an amiable gentleman?
9. What flower declines to live on hills?
10. What flower is an emblem of great sorrow?
11. What flower bears the name of two girls?
12. Which is the youngest of the rose family? —Ida.

Recipes.

Corn Meal and Apple Pudding.—One-half cupful cornmeal, one quart milk one teaspoonful salt, one teaspoonful ginger, one-half cupful molasses, two cupfuls apples cored and cut in eighths. Scald the milk and add the cornmeal; cook for thirty minutes and add salt ginger and molasses. Pour in buttered baking dish; bake for one hour, stirring occasionally; add apples and bake one hour longer without stirring. Serve with cream or pudding sauce.

Cheese Fondu.—One cupful scalded milk, one cupful coarse crumbs, one cupful grated cheese, one teaspoonful butter, one-half teaspoonful salt, three eggs, speck cayenne. Mix milk and bread crumbs, cheese, melted butter and salt. Add yolks of eggs and mix well. Cut and fold in stiffly beaten whites of eggs. Pour into a greased baking dish, set in a pan of hot water and bake in a moderate oven until set.

Lima Beans With Bacon.—Cook until tender, a cup of lima beans in boiling salted water, to which a pinch of soda has been added. Drain off the liquid and add a pint of milk to the beans. Slightly thicken the milk with one tablespoon of flour blended with one tablespoonful of bacon fat. Add salt and pepper and place on a platter surrounded with slices of broiled or fried bacon.

Pineapple Pie.—Beat one-half cupful butter, one cupful sugar and yolks of three eggs to a cream. Add one can grated or crushed Hawaiian pineapple. Dissolve one tablespoonful cornstarch in a cup of sweet cream and add to the pineapple. Mix thoroughly. Beat the whites of the eggs until stiff and fold in lightly. Have ready a pie tin lined with crust. Fill with the pineapple mixture and bake in a moderate oven. Serve cold.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

Waist 2109-Skirt 2110—A smart and pleasing costume. Waist 2109 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 2⅝ yards of 36-inch material for a 36-inch size. Skirt 2110 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 3⅛ yards of 44-inch material for the skirt and 2½ yards for the tunic for a 24-inch size. Two separate patterns, 10 cents for each pattern.

2124—A practical work suit for women. Pattern is cut in 4 sizes: Small (32-34 bust measure), medium (36-38), large (40-42), extra large (44-46). Size medium will requires 6¼ yards of 36-inch material.

2104—A charming lounging robe. Pattern is cut in 4 sizes: Small, 32-34, inches bust measure, medium 36-38, large 40-42, extra large, 44-46 inches bust measure. Size medium requires 6¼ yards of 44-inch material.

1270—Children's overalls. The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 2⅛ yards of 36-inch material for a 6-year size.

2099—Mother's girl's favorite play dress. Pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 1⅞ yards of 27-inch material for a 6-year size.

1947—Ladies' house dress with sleeve in either of two lengths. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6⅞ yards of 36-inch material for a 36-inch size.

2116—A set of serviceable caps. The pattern includes the three styles portrayed. It is cut in 2 sizes: Medium and large. No. 1 will require 1 yard, No. 2 will require ⅞ yard, No. 3 will require ⅞ yard of 27-inch material for the medium size.

1796—Ladies' dress. Pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 7 yards of 44-inch material for a 36-inch size.

1776—A pretty frock for mother's girl. Pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3 yards of 44-inch material for a 6-year size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for June 3, 1917.

Jesus Betrayed and Denied.

LESSON TEXT—John 18:1-11, 15-17.

GOLDEN TEXT—He was despised and rejected of men.—Isa. 53:3.

In teaching this lesson to some of the younger classes, emphasis might be placed upon the dramatic scene in the garden of Gethsemane, and Peter's denial at the fire. In some of the intermediate classes the scholars might be asked to write short, one-minute essays, describing the scene as though they, themselves, were present. For the adult classes, of course, the central theme is the way that Christ's followers neglect him today even as the disciples slept in Gethsemane, and betrayed him like Judas or denied him like Peter.

I. The Place of Retreat (vv. 1-3). In his emphasis upon the spiritual grandeur of the deity of Jesus, John does not dwell upon the agony in the garden. He, however, gives us that noblest passage in the New Testament (chs. 14-17), the like of which cannot be found anywhere else in the world's writings. Having spoken these words, Jesus and his disciples went over the Brook Kedron (v. 1) to the garden, there to bear the awful weight of agony that was crushing him (Matt. 26:38), while at the same time he must strengthen his disciples, and fortify them against the coming trials. That this was a place of frequent resort for Jesus, Judas was aware. It was a sanctuary in which Jesus met the Father, and those who knew him knew it as a place of prayer, and the most likely place to find him at that time of night (v. 3). Rebuffed at Mary's prodigality, Judas had consorted with the priests, and now covetousness is to reap its reward. Judas was not hardened in a day. His greed for money, while at the same time listening to the teachings of Jesus, had gradually hardened his heart

II. Protecting and Protesting (vv. 4-11). (See Matt. 26; Mark 14; Luke 22). Jesus went forth in order to concentrate the attention of the soldiers upon himself, and to prevent a general attack upon the disciples. In answer to his question, they said they were seeking "Jesus, the Nazarene," a term of contempt which Jesus answered by saying, "I am he." John adds, "and Judas also which betrayed him stood with them." Greed for money, growing into theft and falseness of life, ended with the blackest crime the world has ever known. His salutation sent them backward (v. 6). Perhaps among the officers were some who had failed to arrest him on a former occasion (ch. 7.46), and who were now overawed by his marvelous words and majestic bearing. Again he answered, "Whom seek ye?" (v. 7), and they said, "Jesus of Nazareth," the same words as before, but probably in a changed tone, showing that they were prepared to listen with respect, though certainly not with reverence, to what he might have to offer. What a dramatic picture—the brazenness of sin, Judas who stood among the enemy, and the fearlessness of virtue, Jesus, facing his accusers. Augustine, commenting on this verse, says, "What will he do when he comes as a guest, if he did this when giving himself up as a prisoner?" His act, however, shielded his disciples, for not one of them was to be lost (v. 9 R. V.), and he knew they were not strong yet to stand the test of arrest and trial. At this point Peter attempts to defend Jesus (v. 10).

III. Peter Denying (vv. 15-17). As Jesus was led away, his disciples forsook him. They all left him, and fled, but Mark adds that a certain young man followed Jesus. It is conjectured that this young man was Mark. With quickness of action we are now transported to the judgment hall. There we see him bound, with his hands shackled behind his back, and led first to Annas (v. 13), which was an illegal transaction, "as though some reformer should be tried at Tammany hall in New York" (Robert E. Speer). Annas was now very old. From him he was taken to Caiaphas, followed by Peter "afar off," now in a different mood than when he smote the high priest's servant's ear. With him was that other disciple (John's way of referring to himself). Now John was known to the high priest, and he went in with Jesus into the palace, but Peter was standing without at the door. Notice the steps of his failure; First, he "slept" in the garden; second, he followed "afar off" (Luke 22:54); third, he "stood" without; fourth, he "sat" in the midst.

Then notice the denials, the last accompanied by cursing. Attempts to compromise with the world meet with the same measure of failure today as when Peter was in the judgment hall. Bad company is a good thing to keep out of unless gone into to witness for Christ. Peter did not have that purpose. The Lord had only to "look" at Peter (Luke 22:61), and he "remembered." We may deny Christ by our silence, by remaining outside of the church, by denying his existence, by profanity, by ridiculing his friends, by praising his enemies or by living a life of worldliness.

Cow-Testing Reports.

In Portage County.

To the Editor:—The following is our 45-pound list for the month ending May 4th:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat

FARMERS' MARKET

Wanted---For Sale---To Exchange

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

The Wisconsin Farmer, Madison, Wis.

FARM LANDS.

NORTH DAKOTA is essentially an agricultural state. In the past five years it ranked first in production of wheat twice, twice it was second and once third; always first in production of spring wheat; also flax, equaling production of all other states. Once it was first in barley, never below third; never below seventh in rye and oats. Has made great increase in corn and stock. You can still obtain home there without commission to us, while land is still cheap. Easy terms. Write AT ONCE, for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Building, Minneapolis, Minn.

640-ACRE FARM—"PAY AS YOU MAKE IT" NORTH DAKOTA SECTION, fenced, near market. Splendid for grain, alfalfa and stock. Strong demand for farm products; unusual opening. Will sell on "Half Earnings" plan, and help reliable farmers secure live stock loans. Only small cash payment required. HACKNEY LAND CREDIT CO., Hackney Bldg., St. Paul, Minn.

"AN EMPIRE OF HARDWOOD LAND"—We own 20,000 acres and four townsites, traversed by three railroads. Send for map. Wonderful opportunities for saw mills, box and woodworking factories. Free factory sites. Ask for information. UPPER WISCONSIN LAND CO., Ladysmith, Wis.

LAND CLEARING MADE EASY—Tells about stump removal by modern machinery. Write for it today and other facts about cheap upper Wisconsin land. Wisconsin Advancement Assn., 1590 First Nat. Bank Bldg., Milwaukee, Wis.

HELP YOUR COUNTRY by helping yourself, 320-640-acre homesteads. Circular free. Low-priced dry and irrigated farms. Homesteaders' Guide, Salt Lake City, Utah.

IMPROVED FARMS, best of location, priced reasonable, easy terms. W. F. Ryan, New Richmond, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

BARK PEELERS WANTED.

MEN WANTED—100 bark peelers at $3.50 per cord; general woodsmen, $40 per month and board. Station work along right of way of new logging railroad; prices according to character of work. Apply at once. Rib Lake Lumber Company, Rib Lake, Wisconsin.

SEEDS.

GOLDEN GLOW SEED CORN, $3 per bu. Clark's Yellow Dent, $3.50 per bu. Ear or shelled. 98% germination. BURTON PECK, Spring Green, Wisconsin.

EMPTY BAGS.

HAVE YOU ANY EMPTY FEED BAGS to sell? Advise how many you have. We will quote you highest prices. Write today. Springfield Bag & Burlap Co., Dept. 5, Springfield, Ill.

CHESTER WHITE PIGS.

CHESTER White fall pigs sired by W. B.'s Wonder now ready to ship. Wm. F. Belda, De Forest, Wisconsin.

SAVE MONEY ON LUMBER.

SAVE money on your lumber bill. Write us. Pacific Coast Sawmill Co., Portland, Oregon

POULTRY AND PET STOCK.

BABY chicks from standard-bred, Single Comb White and Brown Leghorns, $10 per 100; $90 per 1,000. Bred to lay large white eggs. Safe arrival guaranteed. Catalog free. Wolverine Hatchery, Box 2221, Zeeland, Mich.

HATCHING EGGS from our fine flock of excellent winter layers. Queen strain Single Comb White Leghorns. Immediate shipment, eggs testing 95% fertile. $1, 15; $5, 100. Safe arrival guaranteed. Mrs. A. Dorn, Hilbert, Wis.

S. C. W. LEGHORNS, Young's strain. Eggs, $2, 45; $4, 100; chicks, 10c. Satisfaction guaranteed. Thornt Hubbard, Medora, Ind.

BELDA'S BARRED ROCKS, eggs for hatching, prepaid, 15 for $1.50; 30, $2.75; 50, $4; 100, $8. Wm. Belda, De Forest Wis.

FOX HOUND PUPS, full blood, 8 weeks old; best rabbit hunters. For sale cheap. F. C. Schneider, Lebanon, Wisconsin.

WHITE WYANDOTTE EGGS, $1.00 for 15 postpaid. L. T. Solchenberger, Union Center, Wis.

FULLBLOOD Scotch Collie pups for sale at farmers' prices. J. V. Northrup, Waupun, Wis.

ITALIAN bees; Barred Plymouth Rock eggs, 15, $1.00. Elias Fox, Union Center, Wis.

PURE-BRED WHITE ROCKS. Address "Kremers," Whitehall, Wisconsin.

OREGON & CALIFORNIA RAILROAD CO grant lands. Title to same revested in United States by act of Congress dated June 9, 1916. Two million three hundred thousand acres to be opened for homesteads and sale. Timber and agricultural lands. Containing some of best land left in United States. Now is the opportune time. Large sectional map showing lands and description of soil, climate, rainfall, elevations, etc. Postpaid one dollar. Grant Lands Locating Co., Box 610, Portland, Oregon.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Movement For Better Poultry.

To the Editor:—A great movement toward better poultry, the conservation of poultry products and the ultimate results in profit from closer study of this industry has been taking place in Wisconsin this season.

Through joint committees of the Wisconsin Breeders' Association, the college of agriculture and the agricultural extension service of the University of Wisconsin, assisted by local poultry associations, over twenty poultry clubs have been organized in the state within the last few months.

The members of these boys' and girls' clubs are showing great activity in the study of the science of poultry culture and in their home project plans for raising chickens.

Not all of these students will become future poultrymen and poultry-women, but the lessons learned here of faithful attention to details are the fundamental principles underlying the care of all animals and cannot fail to have a healthy moral influence in developing future men and women.

A two years' course of lesson topics by the U. S. Department of Agriculture, coöperating with the poultry department, has been prepared by J. B. Hayes, of the poultry department of the University of Wisconsin.

The scope of the first lesson topic is embodied under the following heads:

The poorest hen produces no eggs, the world's record hen produced 314 eggs in one year. The average production is sixty eggs per year. Practice selection in the flock throughout the year to dispose of the poor producers and keep the good producers. The success in poultry keeping depends upon good strong, vigorous, healthy stock that is capable of heavy production in the winter months as well as in the spring months.

Disposing of poor producers decreases the feed bill without affecting the egg yield.

1. Select active hens. Birds that are active, happy and contented are producers. The best indication is to watch the fowls that are off the roost early in the morning and back late at night, putting in long working hours and going to bed with a full crop.

2. The hen with a good rich, red comb is either laying or about to lay. The eye is also bright and clear. The head is short, broad and full.

3. The body of a producer is deep and wide through the rear. The abdomen is full and pliable, but not "baggy" showing that fat has been stored up for the manufacture of eggs.

4. Short, closely-worn toenails indicate activity and activity means production.

5. Late molting hens are profitable. Discard all hens that molt before August 15th. Hens that molt in October and November are better producers than those that molt in July and August.

6. Select early maturing pullets that lay during November, December, January and February. Late hatched pullets that do not lay in January or February will not lay until spring and are "boarders."

7. Individuals in such breeds as the Rocks, Rhode Island Reds, Wyandottes and Leghorns that have pale-colored shanks in September and October are better producers than those with rich yellow shanks.

8. Pliability of the width between the pelvic bones indicates production.

9. Early hatched pullets are generally better winter producers than one or two-year-old hens.

10. Select an active, well-matured male as breeder.

The subject matter of the other lessons will appear later in these columns.

The members of the boys' and girls' clubs will be given credits for their lessons and home project work with poultry.

An inspection of the premises equipment and methods used by the individual members in the rearing of young chickens will be made by instructors from the department of poultry husbandry, University of Wisconsin, and complete records and a written description of the experiments will be required to be handed to the local leader.

Mrs. A. J. Schloerb,
Omro, Wisconsin.

BOYS' AND GIRLS' POULTRY CLUB, OF OMRO, WIS. FIRST ORGANIZED UNDER COOPERATION PLAN OF STATE AND FEDERAL EXTENSION WORKERS.

Raise More Turkeys.

To the Editor:—I have often wondered why farm women do not raise more turkeys. I have raised them for over twenty years and at the beginning my profits were not very great, but most every year more profit than loss. Of late years the scarcity of turkeys and the high prices obtained for them have made me study them more.

I have not the best of places for turkeys, but I believe I can raise them as safely as chickens. I wintered thirty hens and only lost one, and that was through carelessness. We have a flock of about eighty hens now. I keep one medium-sized tom to about ten hens. Every year I run all over the farm after them. But this year I had an old orchard fenced on two sides with forty-inch woven wire with one barb on top, and two sides with twenty-four-inch wire with three barbs on top. I also cut one wing off as close as I could and they do not offer to stray. For the first week they seemed heartbroken, but a variety of feed and kindness soon reconciled them.

I take my larger toms out to a block of wood and with a good, sharp knife pare off their toenails. It won't hurt them if they bleed some. See that this is done before any hens are injured.

Be sure and keep them healthy. I used to cure my turkeys, but the best plan is to keep them well. In good, fresh drinking water I put every two or three days some permanganate of potash (get it dry at the drug store and put in a bottle with water).

Don't expect them to live on grass from now on. All the year I feed my turkeys a little corn and oats and every few mornings dry bran, which is very good for them. I give them plenty of grit and all the charcoal I can get.

Mary Hakes.

Every weak ear of corn planted reduces the yield from five to eight bushels to the acre. Each bad ear planted means a loss of $3 to $5 an acre.

EGGS—BABY CHICKS: 20 varieties. Safe delivery guaranteed. Catalog free. Miller Poultry Farm, Box E, Lancaster, Missouri.

SINGLE Comb Buff Leghorn eggs from first-class stock at $1.00 per 15, 100, $4.50. Charles Schmit, Hortonville, Wisconsin.

REDS AND ROCKS—Eggs, $1.50 for 15, $6 per 100; chicks, 15c each. Coleman's Poultry Farm, Clear Lake, Wis.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department.

Questions and Answers.

Steadying Ford Light With Dry Cells.

I have a new 1917 Ford touring car. I have heard that it is possible to send the lighting current through a pair of dry cell batteries, thereby making a steady, even light at both high and low speeds. Is it possible, and would it injure the magnets?

Answer.—We have never seen this scheme tried out. We doubt that it would work satisfactorily, and there would be danger of demagnetizing the magnets.

Favoring the Light Horses.

Is it possible to make a four-horse evener for a sulky plow so that three horses will walk on the unplowed ground, and one in the furrow; the two outside horses pulling two-fifths of the draft and the two inside horses pulling three-fifths of the draft?

Answer.—In order to arrange the draft in this manner, make the evener as illustrated and described above, except that the center pulley should be located thirty-five and three-fourths inches from the left-hand end and the plow clevis pin hole twelve inches from the center of the right-hand pulley.

Strength of Wire Rope.

I would like to know if a homemade wire rope made of No. 15 galvanized iron wire is stronger than a solid No. 5 galvanized steel wire. I pump the water 750 feet from the well to the yard, using a gas engine located at the yard, in connection with windmill quadrants. I have had a great deal of trouble with the wires breaking. I put up a tower higher than the yard, so that the outfit has only to pump the water, not force it up to the yard; but still the wires break. I think that the wire is too hard for the purpose.

Answer.—Wire rope would undoubtedly work better than solid wire, as it is not only more flexible, but much stronger for the same weight of metal. It would be better for you to buy the rope rather than make it. The boughten rope has a hemp center and is lubricated so as to make it flexible and durable. Use wire rope three-eighths of an inch in diameter.

Power of Tractor.

Would a tractor with a four-cylinder throttle governed motor of four-inch bore and six-inch stroke running at 650 R. P. M. have power enough to pull three fourteen-inch plows at two and three-fourths miles per hour? If the motor runs at 950 R. P. M. and the tractor travels two and three-fourths miles per hour, would it have power enough to pull two fourteen-inch plows? Would the drivers used on the "Tracford" serve the purpose here? Please give the names of the firms making steam cars.

Answer.—The four-inch bore, six-inch stroke motor could not be expected to develop much over fifteen horse power at a speed of 650 R. P. M. This is the amount of power usually considered necessary to operate two fourteen-inch plows. Your Ford or Maxwell motor should have power enough to pull two fourteen-inch plows. The drivers of a "Tracford" would be suitable for making a tractor, using one of these motors.

The Stanley steam car is the only well-known steam car on the market at present.

Tractor Engines—Air Cleaner.

Which will use the most fuel doing the same amount of work; the one-cylinder, two-cylinder or the four-cylinder tractor engine? Why do the four-cylinder tractor engines run at a higher speed than the others? Why do tractor motors become harder to start after two or three seasons' work? Do you know of a dust filter that can be used with a hot-air intake, where a "muff" is used around the exhaust pipe and a flexible metal hose to the carburetor?

Answer.—The amount of fuel used depends upon the general design of the motor, the adjustment of the carburetor and the condition of the motor so much that it is not possible to say which number of cylinders is the most economical. The present tendency is toward a four-cylinder motor. The four-cylinder motor may be run safely at a higher speed than a two-cylinder or one-cylinder motor, as it can be better balanced. On account of the higher speed, it develops more power for the same amount of piston displacement. Regarding the air cleaner, you might write to the Wilcox-Bennet Co., of Detroit, Mich. Old tractor motors are harder to start due to loss of compression.

Liberty Loan

United States Government Bonds for YOU

THAT our allies may buy food and materials to carry on our mutual struggle for democracy, your government is extending them credit through the great $2,000,000,000 Liberty Loan.

Not a dollar of this loan will leave this country or pay for other than American products.

Of the necessity for this loan, Secretary of the Treasury McAdoo says: "The greatest immediate service the American people can render in this war for universal liberty is to furnish the means for its vigorous prosecution. The Liberty Bond Issue is the first step. I earnestly bespeak the co-operation of every citizen throughout the length and breadth of the land in this great service of patriotism."

THE BEST INVESTMENT.

In asking you to subscribe to the "Liberty Loan" your Government does not ask you to spend your money. Instead it holds out to you an opportunity to make the safest investment in the world. When you invest in a "Liberty Bond" you get a signed promise backed by the total resources of the richest nation in the world—a nation whose wealth is recorded at $250,000,000,000.

THE HIGHEST INTEREST IN 20 YEARS.

The present bond issue gives you a chance to purchase government bonds paying the highest interest rate the United States Government has paid in 20 years. Liberty Loan Bonds bear 3½ per cent interest, payable semi-annually June 15th and December 15th. They are exempt from taxation, except for estates and inheritances, and yield an absolutely net income of 3½ per cent.

Liberty Bonds may be purchased in denominations of $50 and multiples thereof. If before the end of the war, government bonds bearing higher interest should be issued, you can exchange your Liberty Bonds for them.

PRACTICALLY AS GOOD AS CASH AND PAYING INTEREST.

The Liberty Loan Bonds are practically as good as cash and they pay interest. They can be used for as many purposes as cash without the risk of actual cash.

They may be registered in denominations of $100 or multiples thereof, so they cannot be lost or stolen. Your income then comes to you automatically.

Liberty Bonds are the best basis for credit in the world. As a farmer you know how handy it will be to use these bonds with your banker to get ready money before your crop is marketed. Machinery and equipment are often cheaper when bought for cash. Let the "Liberty Bonds" help you get it. Your banker will then grow to respect your business judgment and should be willing to make better rates upon the money you borrow.

No investment you hold can be safer and no other bond enjoys such a broad and ready market in case you wish to sell. You can get your money practically as easily as you can from a savings bank.

The last government loan sold at par in 1898 and at 110¾ two years later.

SUBSCRIBE NOW AT ANY BANK OR POST OFFICE.

Your country comes to you today with a solid business proposition—a chance to invest in the best securities in the world, while at the same time promoting the sale of your products.

Unless you act quickly and subscribe now you may not be able to get your share of these bonds. The last great bond issue was over-subscribed seven times.

Make your subscription at any bank or post office in your locality today.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Pinehurst Dairy Dispersion.

AT the Pinehurst dispersion sale which is to be held at Lake Mills, June 12th, there will be offered one of the greatest herds of registered Holsteins in the state of Wisconsin. This herd of 95 head is not only royally bred, but has size, individuality, as well as good seven-day and yearly records. There are 13 yearly record cows in the herd, some of which have seven-day records as high as 34.43 and yearly records as high as 837.353 pounds butter and 18,269.8 pounds milk as a junior three year old. There are four cows above 800 pounds and a number in the 600 and 700-pound classes. The young stock are especially well grown and for the most part sired by King Korndyke Akkrummer Ormsby 166274 and King Segis Concordia Hengerveld 962214. The latter is the senior and the former the junior herd sire of this herd. The former is a 31-pound son of Sir Korndyke Hengerveld De Kol, that has 35 A. R. O. daughters, whose dam is a sister to the sire of Duchess Skylark Ormsby, th present world's champion butter cow. The senior sire is a 28.46-pound grandson of King Segis, as well as a grandson of the noted cow, Sadie Vale Concordia 3d. His sire, King Segis De Kol Korndyke, is also an A. R. O. sire of no small reputation. The following is a partial list of some of the A. R. O. cows in the herd. There are, however, 44 cows with official records to be sold at this sale. Pinehurst Piebe 133468 has 34.43 pounds butter, 551.7 pounds milk in seven days and as a junior three year old 28.633 pounds butter and 535.5 pounds milk and 676.87 pounds butter, 17,234 pounds of milk in a year. Pinehurst Grace 2d 204292, 23 pounds of butter, 511.3 pounds milk in seven days; 837.353 pounds butter and 18,269.8 pounds milk in a year as a junior three year old. Pinehurst Rigtje Queen 184473, 750.045 pounds butter and 19,040.4 pounds milk and 25.157 pounds butter, 575.4 pounds milk in seven days, Pinehurst Lady Mary 184474 has 24.08 pounds of butter, 508.5 pounds milk and 808.183 pounds butter, 20,371 pounds of milk in a year as a three year old. Parthenia Piebe De Kol 72845, that has 460.4 pounds milk and 18.257 pounds butter in seven days and is the dam of four A. R. O. daughters, including Pinehurst Grace 2d, that as a junior three year old made 837 pounds of butter in a year. Valley Rose Mechthilde 72824, that has 22|176 pounds butter, 458.5 pounds milk in seven days; 6,134 5 pounds butter and 14,814.5 pounds of milk in a year. She is also one of the foundation cows with three A. R. O. daughters. Rigtje Piebe De Kol 2d 184471, that has 18.484 pounds butter and 407.4 pounds milk as a four year old on three quarters. When writing for information kindly mention The Wisconsin Farmer. For illustrated announcement of this sale look at the two center pages of this issue.—Adv.

James Derivan.

JAMES DERIVAN, the congenial Poland China breeder at Fox Lake, Wis., has a nice lot of spring pigs to show visitors. Not as many as in previous years—about 50, but he will have some good ones to offer in due time. One of the biggest gilts by Oakland's Equal 2d has a nice litter by Mac's Chief 2d. A Big Orange sow has a fine litter by North Side Wonder. A Long Joe-Black Jumbo sow, and a real good one, has a litter by Wisconsin Jumbo 2d. A big sow by Rood's Big Joe has a good litter by Young Hadley. The best sow on the farm is by Black Jumbo out of an A Wonder dam—she is a real show sow. Mr. Derivan has a good yearling boar at the head of his herd. One with great bone, good on his feet and pasterns with a world of quality. He is a grandson of Big Hadley and his dam is by Goliath Defender by Big Defender. Some good blood is wrapped up in this boar representing old Tecumseh, Defender, Farver's Goliath and Big Hadley. Some of the breeders in Wisconsin have been of the opinion that Mr. Derivan has the medium type breeding, but after you see this breeding you can change your mind. The breeding is big and the sows are good. Keep this herd in mind and when you get ready for that spring boar or a gilt or two, let this breeder quote you prices.—Adv.

Richard Maurer & Sons.

THIS firm has the goods when it comes to good Short-horns. They demonstrated their ability to produce the good ones when they sent a heifer to the Madison sale and show and won championship. They have a number of choice Scotch cows in the herd, but what impressed us most was the choice young things they have in their barns. The herd bull is Baron Primrose by Clipper Stamp by Sultan Stamp, out of a dam by Premier Marshall, and they have some good bulls on the farm sired by this fellow. They have a very fine roan bull just past a year sired by Clipper Stamp out of a Marr Emma dam. Here is a real Scotch bull for someone wanting a bull to head a pure-bred herd of cows. There are also two red yearlings that are ready for immediate service. They have the following bulls for sale and we are glad to recommend any one of them. Some are Scotch, others topped. Two reds, 13 months, one August roan, one choice September roan, one August red, Scotch, one September red, one May red, two red just turned a year. All of these bulls are in good condition. Here is a chance to get a bull to your liking. If interested write to Richard Maurer & Sons, Fox Lake, Wis. The Short-horn bull at the university came from this farm.—Adv.

Waukesha County Guernsey Breeders' Sale, June 7th.

ON June 7th will occur the great event, the tenth semiannual sale of the Waukesha County Guernsey Breeders' Association, at Waukesha, Wis., the Guernsey capital of America. About 60 head of pure-bred Guernsey males and females will be offered by members of this association. This includes several cows with A. R. records as high as 565 pounds of butter fat as a three year old, and many others equally as good. Many heifers, bred and not bred, will be found among the number, all having excellent breeding, some being daughters of Governor of the Chene, granddaughters of Imp. Masher's Sequel, Glenwood Boy of Haddon, Lord Waukesha and Lord Yeksa. Also a few choice males are listed. The reputation of former sales and integrity of the members make this a safe and reliable place to buy Guernseys. This association is in the business to stay, and it is the aim and desire of the members to satisfy all of their customers, and they want your patronage. All the animals have been tuberculin tested and if desired, a certificate of health will be given. A committee of three has inspected all the offering and nothing but the very best individuals have been accepted. No culls or scrubs. Don't forget the joint annual summer meeting of the Western Guernsey Breeders' Association and the Waukesha County Guernsey Breeders' Association at the farm of George McKerrow & Sons Co., Pewaukee, Wis., on June 6th. This is an event that will be enjoyed by all. Come and attend the meeting and remain for the sale the following day. Write F. E. Fox, secretary, Waukesha, Wis., for a catalog of this big sale. See advertisement on page 19.—Adv.

C. J. Schoenfeld & Son.

ONE of the best bulls we saw in Dodge county was Village Mystic, owned by the above firm at Fox Lake. Village Mystic is a counterpart of his illustrious sire, Villager. His dam is imported Flower Girl 12th, so this bull is an aristocrat as far as breeding goes. He was purchased as a calf in the Hannah dispersion sale in Chicago. This sire has great scale, wonderful smoothness, a head full of breed character and his get is a credit to him as a sire of good Short-horns. The Schoenfelds have reason to feel proud of this good Short-horn bull and we have been advised that they refused an offer of $2,000 for him last summer. A fine yearling bull by Village Mystic is for sale. He is out of a Duchess of Gloster dam and can be bought worth the money. These breeders also maintain a herd of Poland Chinas and have for sale at this time a number of fall sows bred to farrow in August and September. They are bred to a son of Half Ton, a big-type boar heading one of the best herds in Indiana. If you are interested in either of the above breeds you will not be disappointed with the stock you find in this herd.—Adv.

Jersey Day in Wisconsin.

THE Wisconsin Jersey Breeders' Promotion Sale at Madison, Wis., June 14th, will be held in the agricultural college live stock pavilion. It has been the purpose of the Jersey interests of the state to conduct a high-class sale by consigning the choicest animals from the most noted herds throughout the state. There will be 70 head of selected Jerseys from 25 of the best herds, in this sale and will, therefore, offer an unparalleled opportunity to select high-class Jerseys for foundation purposes. The sale consists of register of merit cows with records up to 700 pounds. The best blood of America as well as the Island of Jersey will be represented, so that this auction should be one of the greatest Jersey events that has yet been conducted in the state of Wisconsin. Professor U. G. Van Pelt, Kimball's Dairy Farmer, Waterloo, Iowa; Mr. Harry Jenkins, of the Jersey Bulletin, Downers Grove, Ill.; Mr. Boynton, Hoard's Dairyman, Ft. Atkinson, Wis., and Jas. R. Garver, Wisconsin Farmer, Madison, Wis., will attend to bids for parties not in a position to attend the sale. Col. D. L. Perry will cry the sale. For further particulars write to Chas. A. Peterson, Rosendale, Wis., secretary of sales committee. Also write to Mr. Peterson for catalog.—Adv.

NEXT WEEK'S SALE PROGRAM

Wednesday, June 6 — Guernseys, Waukesha County Guernsey Breeders' Association, F. E. Fox, Secretary, Waukesha, Wis.

Thursday, June 7 — Guernseys, Waukesha County Guernsey Breeders' Association, F. E. Fox, Secretary, Waukesha, Wis.

Frank Swan's Guernseys, Wauwatosa, Wisconsin.

MR. SWAN who has been more or less intimately associated with the prominent breeders about Waukesha in promoting their annual sales and stimulating interest for Guernsey cattle in Waukesha county, has been making some very creditable two-year-old records. His cow, Sweet Alice of Norwood, just completed a record of 607.81 pounds fat, Tricky of Maple Heights, as a two year old made 461.94 pounds fat, and Pearl of Maple Heights, 350.6 pounds fat as a two year old. Sweet Alice of Maple Heights and Vazon's Sequel's Jcennilly now on test, look as though they would finish at better than 400 pounds as two year olds. Mr. Swan has five young bull calves for sale, three of which are out of A. R. cows; 544, 562 and 400 pounds respectively. These calves are sired by Billie of Paradise Spring City.—Adv.

Collins Offers Poland Chinas.

P. N. COLLINS, River Falls, Wis., now has for sale spring pigs sired by Black Bone by Black Big Bone and Smooth Jumbo by Black Jumbo, out of big-type bred sows. He also has several bred sows and gilts that he is pricing worth the money. They are bred to Chief Price by Big Price and Smooth Jumbo. Collins will sell you Poland Chinas worth the money and will guarantee every hog or pig he sends out. He also breeds Short-horns and has for sale a limited number of heifers and bulls. Write this breeder. He has been doing business for years and has a long list of satisfied customers.—Adv.

Bred Sows For Sale.

ONLY a few real good sows are being offered for sale at this time, for generally speaking, there is a shortage of breeding stock and those that have them do not care to dispose of them, notwithstanding the good prices that are being paid for good animals. L. E. Pease, Wales, Waukesha, county, Wis., has more sows than he can care for and for that reason he offers a few for sale. Some of them will make 500-pound yearlings and they are bred to a son of Master's Giant that weighed 600 pounds when he was 18 months old and he was not in show condition. You will get good breeding and be pleased if you get one of these sows. They are bred to farrow this fall. If you want a fall boar, Mr. Pease has two that weighed 275 pounds on May 1st. The spring pigs are coming along in good shape, sired by Model Giant, the boar mentioned above, and they will be shipped in June. It will pay you to order early and get the pick. Model Giant will be at Milwaukee this fall and should make a creditable showing, for he is a good boar. Note the advertisement in this issue and write at once relative to the bred sows.—Adv.

Like Produces Like.

BREEDERS of pure Bates Short-horns who wish to increase the milking ability of their herds will do well to keep in mind the herd of George Wenham & Sons, Ft. Atkinson, Wis. They have been breeding Bates Short-horns for 35 years and have produced many good dairy cows of the breed. Among them are Angie, with a record of 1,800 pounds of milk in 30 days, Prize Ida, that made 11,080 pounds in one year, and Samantha 2d 61210, that produced 7,812 pounds of milk in ten months and made a pound of butter cheaper than any other cow in the association test. Cows of similar character and records are the ancestors of the present herd, eight of them having tested 6 per cent butter fat. They are now offering bull calves, one old enough for service. Royal Oxford is bred heavily in the Wild Eyes and Duchess of Oxford families, backed through both sire and dam by Angie and other record cows. He is a good individual and should head a registered herd for excellence of dairy inheritance. See advertisement on page 19.—Adv.

A Progressive Guernsey Breeder.

MR. RALPH TRATT, who lives but a short distance from Whitewater, Wis., and who is generally recognized as one of the most progressive Guernsey breeders of the state, has been doing some splendid A. R. O. work. While visiting his herd recently we had the pleasure of inspecting 12 daughters of his former herd sire, Langwater Hambro, that have just about completed their year's work and will average around 450 pounds fat. These heifers have good size, well placed udders and are consistent producers. Mr. Tratt has also made some other creditable records; for instance, Ringlet, a full-aged cow, made 711.9 pounds fat, 13,000 pounds milk on three quarters and dropped a calf five months after completing this test. Stranford Derina, a full-aged cow, just completed a record of 665 pounds fat; Miss Leutilius finished with 572 pounds of fat and Imp. Darling of Melrose, 580 pounds. Mr. Tratt just recently sold a son of Ringlet to head Gustav Pabst's Guernsey herd.—Adv.

Great Demand For Herefords.

THERE is a great demand for Hereford cattle at this time and we are glad to say that Wisconsin farmers are paying more attention to this good breed of beef cattle. On May 16th McCray sold 75 head of "White Faces" at an average of $1,750; the following day Van Natta, Lafayette, Ind., sold 60 head at an average of over $800; on May 18th Birch & Thompson, Lake Geneva, Wis., sold 60 head at an average of $400. This shows what good Herefords will sell for to people that appreciate this breed. Walter Bros., Chippewa Falls, Wis., have a good herd of Herefords and as they have only been in the Hereford business a short time they do not expect the high prices, though they have cows in their herd that would compare favorably with those sold in the above-mentioned sales. They have some young bulls for sale that are choice, well bred and well grown. Write them for prices and description.—Adv.

A. M. Anderson's Holsteins.

WHILE visiting Mr. A. M. Anderson, who lives a few miles out of Whitewater, Wis., we learned that Mr. Anderson now has in his excellent herd of Holsteins 20 daughters of Sir Pontiac Chief, a 35.43-pound bull. Mr. Anderson also informed us that every animal in milk except one has an A. R. O. record and that these records range from 17 pounds as a yearling up to 28.70 pounds at full age. Mr. Anderson made 17 pounds on a yearling, practically 17 pounds on a junior two year old and 19.20 pounds on another junior two-year-old heifer recently. Practically every time we call upon Mr. Anderson we note some improvement in his farm. In the first place it was a new dairy

Many Inquiries From His Wisconsin Farmer Advertisements.

The live stock breeders of the state will be interested in the following letter to The Wisconsin Farmer from George W. Smith & Sons, Burnett, Dodge county, Wisconsin:

> We have very good results with the advertisement in The Wisconsin Farmer. We had a large number of inquiries coming in all the time. Kept me guessing to keep up with them, besides doing the chores and other necessary work. We have a very attractive bunch of young stock sired by Milkman and Young Clay Jr. We sold a bull and heifer to H. B. Drake & Sons, a bull to James Caughlin, a bull to C. E. Bryham, Lancaster, Wis.; a bull to Joe Hamshire, Marshall, Wis.; a bull to Schroder Bros., Two Rivers, Wis.; a bull to H. E. Kollath, Juneau, Wis.; a bull to Frank Houk, Rice Lake, Wis.; a bull to A. Frederickson, Neenah, Wis., and 8 heifers to H. B. Drake & Sons, Beaver Dam, Wis.

The live stock advertising columns are open to reliable breeders in Wisconsin. We have offers to make to our readers, including practically 80,000 in Wisconsin and more than 90,000 total circulation. Write to The Wisconsin Farmer for rates and further particulars.

barn and silos, then he began fencing his farm with steel fences and at the time we visited him last we noticed that many rods of tile had been laid and that there were many more tile on the farm yet to be laid.—Adv.

The Stock Tonic.

THE uses of the commercial stock tonic must not be misunderstood. Referring to Dr. Hess stock tonic which is very generally used by farmers all over the country, it can be said that Dr. Hess does not claim that it is in any proper sense a feed for stock. It is medicinal—a tonic and a conditioner, not a feed. It does not take the place of the regular feed. The words, "A Conditioner and Worm Expeller," printed plainly on every package, pail and drum, indicate in a general way its use. It conditions the animal system, rids of worms and enables animals to digest and get the benefit of their regular feed. Again, Dr. Hess stock tonic is not a secret preparation. It is compounded by Dr. Hess from his own formula, used for many years, and contains such drugs and ingredients as are everywhere known to produce certain desired results upon the animal as well as upon the human system. Among the ingredients, plainly printed on the packages, are the following: Nux vomica, digestive and nerve tonic and appetizer. Quassia, tonic and worm expeller. Sulphate of iron, blood builder and worm expeller. Sulphate of soda, laxative and liver tonic. Common salt, appetizer, cleanser and worm expeller. Epsom salts, laxative. Nitrate of potash, acts on kidneys. Charcoal, prevents noxious gases. Fenugreek, tonic and aromatic. These ingredients are carefully compounded and are incorporated in cottonseed bran sufficient to hold the mixture in a dry powder. When the purpose of Dr. Hess stock tonic is rightly understood, it will be appreciated why the dosage is so small. It is an economical preparation, a little of it goes a long way, but the best results are obtained from systematic and regular use. The object is to get animals in proper condition to thrive and to keep them that way.—Adv.

Mr. Harry Faville, Lake Mills, Wis.

MR. FAVILLE recently purchased a splendid bull calf from E. C. Schroeder, Moorhead, Minn., to head his herd at Lake Mills. King Ormsby Korndyke De Kol is sired by Sir Buffalo Korndyke, a young bull backed by the blood of show ring winners, his dam being first-prize cow and junior champion at the 1913 National Dairy Show, and his sire was first-prize two year old at the same show. King Ormsby Korndyke De Kol's dam was Dinah Pauline Clothilde Ormsby, a 23.99-pound four year old, that is now on test, having produced 700 pounds of butter her first seven months. The second three months of her test ran ahead of the first, so that in all probability this cow will go far ahead of the 1,000-pound butter mark. Mr. Favillle is to be congratulated upon this purchase, as this line of breeding can not be excelled in the point of combining size, individuality and high production.—Adv.

Prospect Farm Holstein Records.

THE Prospect Farm Herd owned by Paul J. Bast, Rockfield, Wis., has just completed two very creditable seven-day records. Prospect Johanna Homestead 21606, at the age of four years two months and 26 days made 686.4 pounds milk and 30.316 pounds butter, 80 per cent butter, and her daughter, Prospect Johanna Homestead 2d 286809, at the age of two years, two months and 16 days, made 562.7 pounds milk, 18.822 pounds butter fat, equal to 23.452 pounds 80 per cent butter. Prospect Bessie Johanna Homestead is a granddaughter of Netherland Johanna Rue 5th 73312, sired by the famous bull, Sir Johanna De Kol, and is a half sister to Johanna De Kol Van Beers, that formerly held the world's seven-day record. This is Mr. Bast's first attempt at A. R. O. work, which indicates that in the future we will hear much more of the performance of the Holstein herds at the Prospect Farm.—Adv.

Ben Berg, Lake Mills, Wisconsin.

MR. BERG, who a year ago made 32.9 pounds butter and 130.25 pounds butter in seven and 30 days respectively on Lady Oak 2d De Kol, succeeded this year in increasing both of these records, by making 34.09 pounds butter in seven days and 138.71 pounds butter in 30 days. Lady Oak 2d De Kol's dam is Lady Oak 2d, a 21-pound cow that has three 30-pound daughters, as well as being a daughter of Homestead Jr. De Kol. Mr. Berg also made a very fine record on Canary Fobes Inka De Kol, a junior three year old, by making 25.03 pounds butter and 517 pounds of milk in seven days. Mr. Berg also made 18 pounds and 22.26 pounds on two daughters of his herd sire, Canary Fobes Helena De Kol 101267. Those looking for choice bull calves would do well to write Mr. Berg more in detail about the breeding of some which he has on hands out of such cows as just reported.—Adv.

V. S. Culver, Stillwater, Minn.

MR. CULVER'S bull which has recently been advertised in The Wisconsin Farmer, we have had the pleasure of inspecting a few weeks ago and can recommend him to our readers as one that in the point of individuality and high A. R. O. backing has few equals. His dam, Meudlene De Kol Johanna, has produced 117 pounds milk in one day and 799.9 pounds milk in seven days, producing 29.33 pounds butter in seven days. This record gives this cow the distinction of holding the milk record not only in the state of Minnesota, but also in the Northwest and is about the seventh cow in the breed for milk production. We would, therefore, suggest that if any of our readers are interested in an animal of such breeding they would do well to write to Mr. Culver for more detailed information.—Adv.

Emmons Blaine's Recent Pacific Coast Shipment.

MR. BLAINE recently made a royal acquisition to his already famous Milford Meadows Stock Farm herd. This shipment consists of the well-known Pacific prize-winner, herd sire of H. C. Davis, Granger, Wash., and 10 choice heifers ranging from heifer calves to two year olds. Mutual Fobes Longfield De Kol 82595 already has about 12 A. R. O. daughters that give evidence of his worth as a sire, which in addition to his phenomenal show record makes him stand out preëminently as a great sire. Four of the heifer calves are daughters of this bull, which shows the high regard Mr. Blaine has for the line of breeding represented in Mutual Fobes Longfield De Kol's pedigree. He is sired by the well-known Fobes Tritomia Mutual De Kol, that has 27 A. R. O. daughters and his dam, Lady Longfield Fourth's Homestead Lass, is a 30-pound daughter of the well-known Homestead Junior De Kol, that has 71 A. R. O. daughters. This line of breeding blends very nicely with that of the Milford Meadows Stock Farm herd from the fact that their two senior herd sires have contained much of the blood of Homestead Jr. De Kol. Probably the most sensational individaul among the heifers is May Lilu Hijlaard Segis 2d, a yearling calf that is indeed a remarkable heifer calf. She immediately attracts the eye of visitors looking over this shipment, which is rather unusual from the fact that there are other noted prize winners and splendid individuals as well. Mr. Blaine also purchased a splendid bull calf from the E. C. Schroeder herd recently, which is another splendid addition to the Milford Meadows Stock Farm herd.—Adv.

Charles Beveridge, Lake Mills, Wis.

MR. BEVERIDGE is generally recognized as having one of the choicest small herds in the vicinity of Lake Mills and whose consignments to the Lake Mills sales always appear in the best of condition, reports the following A. R. O. records made by several animals in his herd. The most phenomenal cow is Winsor Sweet Butter Maid, sired by Sir Ormsby Johanna De Kol 37689. Her dam is Sweet Butter Maid, a daughter of Pontiac Butter Boy. Her A. R. O. records are as follows: 19.50 pounds of butter at 26 months; 24.60 pounds at three years; 27.67 at four years and 33.48 pounds at five years. Mr. Beveridge has a bull calf born January 1st, sired by a 31-pound bull out of one of his cows, that is now for sale. Tyranena Pontiac Bawn, practically the same breeding of the above cow, also made 24 pounds at five years.—Adv.

The Short-horns Around Fox Lake, Wisconsin.

A REPRESENTATIVE of this paper made a trip to Dodge county, Wis., to see the Short-horns in that vicinity, and we don't believe the farmers and breeders in Wisconsin realize that there are such good herds around Fox Lake and Beaver Dam. H. B. Drake, at Beaver Dam, has one of the oldest herds and a large herd, headed by a Whitehall Sultan bred bull. His herd is about half Scotch and the rest of the females have five or six good Scotch top crosses. Mr. Drake is a good caretaker and his cattle were in good condition and the spring calves are fine. He certainly has a fine bunch of heifers and young bulls coming on for the trade. He recently sold cattle to go to Washington and a bull for Texas. This is one of the good herds in that community.—Adv.

Attractive Red Polls.

WE recently inspected the Red Poll herd owned by Edward Bennett, Black Earth, Wis., and we were very much impressed with the smoothness and size maintained in this herd. Mr. Bennett hasn't as large a herd as some men, but he has good cattle and he is a good feeder and caretaker, consequently the cattle he has for sale are in a nice, thrifty condition. Just at this time he has for sale some very fine bulls from calves up and these will please the man that wants to buy a young bull and grow him out to his own satisfaction. Besides the express rate is very much lower. For those that have been wanting Red Poll heifers, here is your opportunity, for Mr. Bennett has a limited number of real choice heifers. Don't overlook this offering, for they are good and we don't hesitate to recommend them.—Adv.

A Gasoline Saver.

THE kerosene-burning device for Ford cars, manufactured by the Burn-Oil Device Co., Peoria, Ill., and advertised on page 9, is announced as a great fuel saver, and this announcement is backed up by facts to prove it. This invention has been thoroughly tested out, and has stood up every time so that there is no longer any chance for it to do anything but make good. It supplies the automobile with kerosene for fuel at a greatly reduced price, as compared with the price of gasoline, and does the work just as well. If you will write to Burn-Oil Device Co., Peoria, Ill., as per the advertisement on page 9, mentioning The Wisconsin Farmer, the manufacturers will be glad to send you full particulars of the new machine, as well as testimonials that give explicit proof as to the merits and value of this Ford attachment.—Adv.

Fruit Brothers, Waukesha, Wisconsin.

WHILE visiting Fruit Brothers' farm recently we were informed that they had a three-year-old Guernsey cow about to finish at 620 pounds. Lura of Maplehill is sired by May King Vrangue of Ingleside and is a splendid individual as well as a high producer. Another of his daughter's, Lady's Hope, has 400 pounds fat for the first six months at three and a half years. In class G they have a two year old sired by Langwater Hays Rosie, that is a half sister to the three cows they are consigning to the Waukesha County Guernsey Breeders' sale, June 7th. Their former herd sire was recently sold to Hill, Wells & Lawson, Rosendale, Wis. Fruit Bros. now have a number of his daughters in their herd and recently refused an offered of $5,000 for two of them.—Adv.

William Jones, Waukesha, Wisconsin.

MR. JONES, who has unquestionably one of the greatest Guernsey herds in Wisconsin, has been making some splendid A. R. records this winter, which are as follows: Royaline Dora 2d, a junior two year old, made 601.53 pounds fat and 11,800 pounds milk. Yexa Tops of Gold 2d made 571 pounds fat, 13,800 pounds milk. Yexa Tops of Gold 2d is a daughter of Yexa Tops of Gold's Fanny, a cow that has given Mr. Jones probably more distinction than any other among Guernsey circles. This cow stands fourth in the breed in the point of amount of butter produced in a year and second of all breeds in the state of Wisconsin. She also stands third in the amount of milk produced in the Guernsey breed. Mr. Jones is now using a son of this famous cow at the head of his herd which is the most promising young sire, possessing an exceptional scale and capacity. Mr. Jones is a believer in size and constitutional vigor and his herd, therefore, gives evidence of this ideal.—Adv.

SALE DATES.

Guernsey Cattle.

June 7, Waukesha County Pure-Bred Guernsey Breeders' Assn. sale, at Waukesha, Wis.

Badger Live Stock Doing Well.

(Continued from page 9.)

pastures. Farmers are letting most of their calves go for veal. There are more cows in this county than usual. Old meadows are short; last year's seeding looks fair and may make a good crop if the weather is favorable from now on. Oats are slow for this time of the year. Vacant lots in towns will be put in gardens.—E. C. Stuart.

Sauk County.—Barley and oats are backward because of prolonged drouth, but the drouth is now broken. Wheat and rye look well. Meadows and pastures are as good as could be desired. Clover shows an especially good stand. Corn planting is progressing slowly because of the unfavorable weather. The percentage of pigs saved in this locality has been far below normal; some breeders are reporting saving on the average only two pigs per litter. The increase in acreage of corn and small grains is about 10 per cent. County schools are giving pupils vacations so that they may help during the planting season. The railroad company is offering free rental of its right of way for productive purposes.—Richard F. Klemm.

Shawano County.—Pastures are backward. The new seeding of alfalfa, clover and timothy looks fine. More than the normal amount of young stock is being raised, both of dairy and beef type. Many new silos will be built this summer. Young stock for grazing is in demand, but cannot be purchased at reasonable prices and a considerable part of the grazing and cut-over land will go to waste this summer because live stock cannot be obtained to put on it. Pigs are in great demand. Much corn is being planted both for grain and silage. The area of corn will be greater than any time heretofore. This is also true of navy beans, onions and root crops. In spite of the high price of potato seed, a large acreage will be planted to this crop. Winter wheat and rye look as well as usual if not better.—M. J. Wallrich.

Sheboygan County.—Recent rains have broken the dry spell. As soon as the weather gets warmer farmers will turn their cows onto pastures. Seeding of small grains is finished, but considerable potato planting is still to be done. Some corn has been planted and farmers are now busy at this work. A number of new silos will be put up. Alfalfa is fairly good, but clover and timothy meadows are backward.—M. J. Hoppert.

Taylor County.—This week has been favorable for farm work. Oats, barley and spring wheat are all sown. Most of the potatoes have been planted. There will be an increase in the acreage of wheat and potatoes. Meadows and pastures are coming along fine. More attention is being paid to dairying than ever before. There are no contagious diseases among live stock. The weather is cold. Every available space will be put in gardens.—Jno. E. Miller.

Winnebago County.—The season is late and grain crops are backward, but look well. Very little corn has been planted so far. Clover and alfalfa stood the winter well and the season seems to be favorable for hay. A good acreage of sugar beets has been planted. Cows are bringing unusually good prices and considerable interest is manifest in dairying. Cow-testing associations have been formed and a cheese factory started in this vicinity.—S. L. Smith.

MINNESOTA.

Goodhue County.—Most of the young stock wintered well and is in good health, but because of the general shortage of feed they are decidedly thin. Weather is very dry and ground has become hard and baked. Grass is not making a good growth. Hogs are scarce because of the shortage of feed and many farmers have sold off their breeding stock more closely than usual. Grain conditions are disappointing because the hard soil has prevented considerable of the clover from breaking through. It was difficult to respond to President Wilson's call for increased production of foodstuffs in this county, for there is no idle land and the shortage of labor will cause the crops to receive less care than usual.—Otto W. Kolshorn.

POLAND CHINA SWINE.

POLANDS

BIG TYPE, BIG BONE, BIG LITTERS—Spring pigs are ready to ship—order now. Sows and gilts bred, to farrow this fall, to CHIEF PRICE and SMOOTH JUMBO. Also Short-horn bulls and heifers.

HOLSTEIN-FRIESIAN CATTLE.

Purebred Registered

HOLSTEIN CATTLE

All records for butterfat production in 365 days, not only Holstein-Friesian but those of all other breeds, were broken in 1915 by the registered pure-bred Holstein cow, Duchess Skylark Ormsby 124514, when she produced 27,761 pounds of milk containing 1,205.09 pounds of butterfat. The test was made under the supervision of the Minnesota Agricultural College, thirteen different supervisors being employed. This wonderful cow freshened at the age of 3 years and 3 days. Holstein cows as a rule milk longer and produce much larger quantities of milk than any other breed, a fact that has made them the choice of progressive dairymen everywhere.

Send for FREE Illustrated Descriptive Booklet.
The Holstein-Friesian Association of America
F. HOUGHTON, Sec'y, Box 143, Brattleboro, Vt.

WE OFFER NOW FOR SALE

DAUGHTERS of Sir Johanna De Colantha De Kol 53056. We have 4 heifers about 6 months old out of him for sale. Price $600. They are nicely marked, well grown and backed by A. R. O. records and rich breeding. We also have a few heifers bred to a 33.68-lb. bull for sale and also several cows bred to the sa.e bull. Prices on application. Inspection invited.
B. F. WINCKLER & SONS Medina, Wis.

RUST BROS.

OFFER the richly bred Holstein bull, Sir Isa Lotta Hengerveld 188663, born Aug. 18, 1915. Ready for service. His dam, Ida Lotta Hengerveld, at 3½ years made 21.34 lbs. of butter in 7 days, 31 days after calving. She is from a long line of heavy producing ancestors, records of her three nearest dams averaging 27.20 lbs. butter in 7 days. She has inherited this heavy producing ability, and transmits it. Sire of bull for sale is Daisy Johanna 5th, 1st prize two year old at Wisconsin State Fair, 1915. His dam has two A. R. O. daughters. Arthur Rust, West Allis, Wis.

23-POUND HOLSTEIN BULL

BORN March 14, 1916. His dam is a 23-pound daughter of the noted "butter fat" sire, Sir Clyde. Her test is 4.23% fat. His sire is a 25-pound son of the 32-pound bull, Beauty Pietertje Prince, and whose dam is the double bred Ormsby cow, Queen Ormsby Duchess. Send for pedigree and price. Address
DOPP BROTHERS Ixonia, Wisconsin

AT LA BELLE VIEW FARM

The Two Big GUERNSEY EVENTS

Wednesday, June 6, '17
Pewaukee, Wisconsin

THE annual summer meetings of the Western Guernsey Breeders' Association and the Waukesha County Guernsey Breeders' Association will be held jointly at the farm of Geo. McKerrow & Sons Co., Pewaukee, Wis. Come and bring your friends with you to these two important events.

Thursday, June 7, '17
Waukesha, Wisconsin

TENTH Annual Consignment Sale of the Waukesha County Guernsey Breeders' Association will be held. Sixty pure-bred males and females will be offered. Successful dairying depends chiefly upon the cow and it will therefore pay you to come and look over Waukesha county's bred-for-production Guernseys. Auctioneers: Love, Helen and Benjamin.

Send for sale catalog to

HAMPSHIRES or "Belted" swine. Have 20 Mar. weanlings, but in addition offer my "tired" sows, 4 gilts, 2 bred, 2 boars, sexes not related. All stock registered. **Dane Stock Farm, Oshkosh, Wis.**

The Kind of Trenches We Americans Need Most

Pres. Wilson Says:

in his wonderful proclamation of Apr. 15, 1917:

. . . . . The importance of an adequate food supply, especially for the present year, is superlative. Without abundant food, alike for the armies and the people now at war, the whole great enterprise on which we have embarked WILL BREAK DOWN, AND FAIL.

The world's food reserves are low. . . . Upon the farmers of this country, therefore, in large measure rests the fate of the war and the fate of the nations. MAY THE NATION NOT COUNT UPON THEM TO OMIT NO STEP THAT WILL INCREASE THE PRODUCTION OF THEIR LAND, etc. . . . . .

To the American Farmer

You heard the "call" from the head of your nation addressed directly *to you*. What have you done about it? The "call" for maximum food production means greater acreages to be prepared, planted and cultivated. Are you equipped to answer your country's demand? You have done it in the past—you, no doubt, will do it NOW.

But conditions are different. Then, it was a "call to arms." Now it is a "call to farms"—to grow more food because there is a vast shortage in the world's food reserves. This means YOU must plow more; plant more; do it quicker; do it better; in order to do your full duty to your country's demand. You must plant every available acre, especially should your acreage of grain be extended. Your problem will be easier; your response to the "call" more helpful, if you will "enlist" the services of a

MOLINE ORIGINAL 2 WHEEL TRACTOR UNIVERSAL TRACTOR

HERE is a light, handy, compact, two-wheel tractor which costs less than four horses, but will do the work of seven horses. No other tractor on the market will do such a variety of work. It is strictly a ONE-MAN, all-purpose tractor; heavy enough to do all farm work, yet light enough to work on soft plowed ground without packing the soil and is inexpensive to operate—in fact, it is cheaper than horses.

—It will CULTIVATE as well as plow.
—It will do your discing, harrowing, planting, mowing, haying, harvesting—in short, anything you can do with horses, also all belt work on the average farm.
—It will do all this easier, quicker, cheaper than with horses.
—It pulls two 14-inch bottoms and furnishes 10 to 12 h. p. on the belt.
—It is made and backed by one of the oldest, strongest, most dependable farm implement companies in the world and built in the largest tractor factory in the world.
—It is the only tractor which will do all farm work without horses. You ride the tool—not the tractor—where you can plainly see the work you are doing.

Write for free catalog-folder and see for yourself how this handy all-purpose, one-man tractor will not only help you answer the country's "call" more completely, but help you solve your power and hired help problems to your utmost satisfaction.

MOLINE PLOW COMPANY

Dept. 30. MOLINE, ILLINOIS

[7]

READ

this letter from a Moline user:

The Moline-Universal Tractor has proven to be one of the best investments that I have ever made. It has been doing more than I expected of it. I have plowed 60 acres this fall. The Moline-Universal Tractor and two horses constitute the power of my 160-acre farm and there is very little work left for the horses to do. When the week is past, we find that more time has been spent caring for the horses than for the tractor. It is a little wonder when it comes to pulling a load up hill.

NORMAN BIERY,

THE WISCONSIN FARMER

VOL. XLVI. NO. 23. THURSDAY, JUNE 7, 1917. WHOLE NO. 1845

Dairying in Western Wisconsin.

SPLENDID work is being done in western Wisconsin in developing dairy herds. The conditions are scarcely less favorable than in the western and southern portions of the state, and those who have taken up dairying in the right spirit and followed correct methods have met with distinct success. No doubt the western section of Wisconsin may be expected in the immediate future to provide much of the increase which we look for in dairy production in this state. That the breeders of western Wisconsin are alert to their opportunities is evidenced by the good work of such organizations as the Western Wisconsin Holstein Breeders' Association, of which Mr. C. A. Van Der Schaaf, of Monroe county, is president and a leading spirit. Those who ride through Monroe county on the train may get an idea that the territory around Sparta is made up generally of big stretches of sand. If they would leave the train and take a trip into the country they would discover that this desert area has distinct limits and that the land outside of it is as fertile as any in Wisconsin. The Van Der Schaaf farm offers a good illustration of what has been done in western Wisconsin in the breeding up of a Holstein herd. What Mr. Van Der Schaaf has been able to do may be accomplished in almost any section of our western counties, and hence a recital of his experiences, even though less extended than the successful results warrant, should be an inspiration to our readers.

Mr. Van Der Schaaf was one of the visitors to western Wisconsin who went further into the merits of that portion of the state than to simply get a bird's-eye view of the sand prairies through which the railroad runs. He began his experience as a farmer by working on a number of farms near the city of Sparta. While he worked and saved he planned for the future. His observation made him so confident of success that one day he went to bed $14,000 in debt. But he slept as soundly after as before acquiring the financial burden. He felt safe that the money invested in farm land would prove a good investment.

That was ten years ago. The farm is running better than ever. The financial side has a healthy look and Mr. Van Der Schaaf feels modestly proud that his calculations turned out to be correct.

Since Mr. Van Der Schaaf is a Hollander, his taste naturally runs to Holsteins. And on the Holsteins he banked most heavily for the returns that were to make purchase of the farm possible. They are still on the job, the Holsteins are, just a small herd, but working hard. Mr. Van Der Schaaf does not consider more than he can handle. He believes that a herd of about thirty good cows can be better taken care of by the average dairyman than a larger herd; about fifteen cows form the milking herd the year around. Tests for phenomenal records have not been made at Enterprise Stock Farm, as he calls his place. But every cow must show her worth at the pail. In return for this, Mr. Van Der Schaaf feeds them well on clover and grain in

MR. VAN DER SCHAAF RECOGNIZES THE SUN AS A GREAT DISINFECTANT.

accordance with their milk flow and provides for the calves a sire with a reputable ancestry. His herd bull, North Star Cornucopia Sir Beets, is sired by Sir Beets Cornucopia Netherland, famous for his many winnings at the shows throughout the country. First and grand championship prizes came to him as regularly as he was entered. The two nearest dams of Sir Beets averaged 29.29 pounds of butter in seven days.

A young bull recently purchased by Mr. Van Der Schaaf traces back on the sire's side to Colantha 4th's Johanna Lad. His grandam was Johanna De Kol Van Beers.

There are about 100 acres of tillable land on the farm besides forty acres of wood lot. Of the 100 acres, sixteen are devoted to pasture for the milking herd and the balance is planted to corn, oats, barley and clover hay. In between the clover alfalfa has been sown for the last two seasons to inoculate the ground for a possible future stand of alfalfa. Patches of the meadow are sown to a mixture of one-third alfalfa, one-third timothy and one-third clover. The showing made by the alfalfa has been so satisfactory that a plot of alfalfa will be put in during the coming year.

The barn is undergoing improvements this year in accordance with Mr. Van Der Schaaf's plan of "purchase as it can be paid for." Steel stanchions are going to replace the old wooden stanchions and a cement floor the earth and wood floor. A cement floor has also been laid in the separator room and in the hog barn. But the farm had to show that it would pay for the improvements and that the improvement would help the farm.

We have before stated that Mr. Van Der Schaaf is a leader in the Western Wisconsin Holstein Breeders' Association, and at this writing he is president of that association. The main object of the organization has been to sell and help sell surplus stock of the members who reside in Monroe, Jackson, Vernon, La Crosse and Trempealeau counties. At this time the work is somewhat slack, owing to the fact that buyers from all parts of the United States have fairly swamped the Wisconsin Breeders' Association with orders for grade and pure-bred cattle, both old and young. There is not a great deal of extra stock on hand. The growth of this association has been steady, being backed by the proper spirit on the part of the members. It was started in December, 1915, mainly through the work of Mr. Van Der Schaaf and L. E. Little, of the La Crosse County Agricultural School. The start was made with only eighteen members, but the association has kept adding members, until at present sixty-three breeders of Holstein-Friesian cattle are on the roll.

In order to make the association meetings more than strictly business meetings, the Holstein breeders of western Wisconsin combine with the La Crosse county associations of Guernsey and Jersey breeders and hold the summer meeting

(Concluded on page 21.)

NORTH STAR CORNUCOPIA SIR BEETS, HERD BULL ON THE VAN DER SCHAAF FARM.

Will Be Big Demand For Buckwheat.

Sow It About the Middle of June---When Other Crops Fail Try Buckwheat---By R. A. Moore, Wisconsin Station.

TRY A FIELD of buckwheat this year. This wheat substitute will be in greater demand than ever next fall and winter. Buckwheat always takes quite an important place in the human diet, for practically everyone is fond of buckwheat pancakes.

A great deal of buckwheat is used for feeding purposes. It is highly recommended as a poultry feed.

Certainly there never was a time in the history of the state when more attention should be given to the buckwheat crop than the present year when all human and animal foods are so high in price. And Wisconsin farmers have not begun to supply the mills of the state with all the buckwheat they want. The millers have had to buy a large part of their supply from New York, Michigan and Pennsylvania.

Besides all this, buckwheat is a handy crop—it fills in when and where crops like corn, clover and other cereals fail to thrive. The land can generally be fitted for buckwheat after the other crop has failed. Newly cleared land that cannot be prepared before the middle of June can be put in buckwheat.

Buckwheat is easy to grow, and will give good returns on soil that is so low in fertility that other crops will scarcely grow. It will also respond readily to the richer soils.

While buckwheat should have good drainage, it is a splendid crop to grow on marshes which have been broken after drainage. It will help decay the vegetable matter on almost any new soil.

Clover and grass seedings are often put in with buckwheat and where the desire is to follow the buckwheat crop the next year with a hay crop, the clover and grasses are seeded at the same time buckwheat is sown. Buckwheat renders good shade for the tiny grass and clover plantlets, and aids very much in getting this crop established in the fields.

Buckwheat is also a great weed killer, helping to destroy all kinds of farm weeds. It grows erect and has broad spreading leaves which aid very much in keeping down weed growth and preventing rapid evaporation of moisture on sandy lands.

Three varieties of buckwheat can be sown in Wisconsin—Silver Hull, Japanese and common black. The first two varieties are exceptionally good strains for our conditions.

Buckwheat, just like any other crop, responds to good culture and for that reason the ground should be well prepared. If the ground can be worked over in the early part of June and allowed to lie for a few days to become compact, it will aid in the production of a good crop. A bushel to the acre planted by an ordinary grain drill or seeded is sufficient. Where Silver Hull is used, three pecks to the acre is enough.

Don't plant buckwheat too deep—not more than an inch on heavy soils, and from one to two inches on light soils. If the ground is newly plowed, it is a good plan to use a planker or roller to firm the soil before the seed is sown.

While, as a rule, a crop of buckwheat can be matured in the southern half of Wisconsin if sown at any time up to July 1st, it will be better to sow a little earlier so as to miss the heavy fall frosts. From June 10th to 25th would be about the right time, and when the seed is sown the crop needs no more attention until it is ready to harvest.

The time to harvest can usually be determined by the number of the ripened seeds. All the seeds will not ripen and there will be green seeds and even flowers on some of the plants, yet it can be caught at a time when the large portion of the seed has turned black, gray or brown.

Cut into small loose bundles and shock it like other grain. In order to allow the buckwheat to dry to better advantage, it is often cut with a binder without binding and left in loose bundles on the field. Later after drying, it is bound by hand. If the bundles are small and loose, they will dry out if properly shocked.

Buckwheat is threshed the same as other grains with an ordinary threshing machine. Concaves of the machine should be lowered so as not to crush seeds.

Usually a good local market is found for buckwheat. If, however, there is any doubt about securing a good market for the seed, full information can be secured by addressing the agricultural experiment station, Madison. The large buckwheat mills usually pay a good price for all buckwheat that is produced.

It seems in these days when there is need for an increased food production that a great deal of land which has not been used heretofore could be put into shape to raise a profit-producing crop of buckwheat.

Homestead Laws.

The U. S. homestead law provides a way by which a citizen may obtain a home on the public lands of the United States without cost, except the small sums necessary to entry and proving up. The homestead exemption laws of the various states are for an altogether different purpose: They do not provide a way for a person to obtain a home, but provide a way for a person who has already obtained a home to keep it safe from seizure and sale on execution or attachment. A man with a family can hardly be turned out of house and home anywhere in this country on account of his debts. In most of the states a person who is the head of a family is entitled to hold and occupy his home to a certain extent and value, free and exempt from all debts incurred after acquiring such home, except lien debts voluntarily placed upon it by both husband and wife. One of the essential elements of a homestead is that it be used as the home of the family. If it be abandoned as a home it cannot be lawfully claimed as a homestead. A mere temporary absence from it would not amount to abandonment. It has even been held that leasing a homestead with the intention of returning thereto after the expiration of such lease does not constitute abandonment. Either husband or wife may be the owner of a homestead. It is intended by law for the benefit of the family where the family may be sheltered and live beyond the reach of financial misfortune and the claims of creditors. Generally a homestead cannot be sold or mortgaged by either husband or wife without the consent of the other, but husband and wife may join in selling the homestead or placing a mortgage on it, and may sell it and put the proceeds in a new homestead which will, when acquired, be exempt from sale for debt.

In Iowa a homestead must not exceed half an acre if it be in a town or city, and not more than forty acres in the country, but in either case if a homestead be worth less than $500 it may be enlarged to that extent. It must not contain more than one dwelling house and such other buildings as are reasonably connected therewith, or, as the law says, "appurtenant thereto."

In Missouri a homestead in the country may consist of 160 acres of land of the value of $1,500, or eighteen square rods in a city of 40,000 people, or five acres in a town or city of less than 40,000 people.

In Oklahoma a homestead may consist of 160 acres of land in the country, or one acre in a city, town or village, with all improvements thereon, without regard to value.

In Illinois a householder having a family is entitled to a homestead to the extent in value of $1,000 in the farm or or lot of land and buildings thereon.

In Wisconsin forty acres of agricultural land, with dwelling and improvements thereon, or a quarter of an acre with dwelling and improvements thereon in a town or city, may be claimed as a homestead.

In Minnesota a homestead may consist of eighty acres of land with dwelling and improvements thereon, or one lot in a city of over 5,000 people, with improvements and dwelling, or a half acre with dwelling and improvements in a city or town of less than 5,000 people.

In North Dakota a homestead must not exceed 160 acres in extent, nor be of greater value than $5,000, or two acres in a town plat.

In South Dakota a homestead of 160 acres of land worth not to exceed $5,000, or one acre in a town plat is allowed.

In Nebraska 160 acres of land in the country worth not exceeding $2,000, or two city or town lots of the same value, may constitute a homestead.

In Kansas a homestead may be 160 acres of land, or one acre in a town or city, with all improvements thereon, when the same is occupied by the family as a home.

Law Questions.

Cannot Recover Damages.

A Subscriber, Bryant, Wis.—I bought a jack pump to run by a gas engine. While it was running I tried to oil it, and the cut wheels caught my glove and drew in a finger of my right hand and injured it so that the doctor had to amputate it. Can I recover damages on account of the cut wheels being uncovered?

Answer.—You cannot recover damages for the injury to your finger.

Trespass on Land.

A Subscriber, Rice Lake, Wis.—A owns a farm in Wisconsin, and a river runs through the farm. There is a public road by the river and certain parties go from the road and take from the river bed and banks gravel for concrete use. Has A a right to forbid them from so doing, and stretch a wire to prevent them from taking gravel?

Answer.—A has a right to forbid and prevent the taking of gravel from the river bed and banks on his land and to stretch a wire for that purpose so that it does not interfere with the road.

Division of Partition Fence.

A Subscriber, Corliss, Wis.—(1) I wish to have a line fence between my land and the land of my neighbor. Which end of the fence must I build? (2) The fence will be of wire. On which side of my part of the fence should I attach the wire?

Answer.—(1) If you and your neighbor cannot agree upon the matter apply to two or more fence viewers to decide it and they will meet and divide the fence and assign to each party the part he is to build. (2) Attach the wire on your own side.

Compelling Neighbor to Fence.

Mr. Homer C. Beattie, Antigo, Wis.—What legal steps will it be necessary for me to take to compel my neighbor who owns adjoining land, to build his half of a partition fence between our farms?

Answer.—You can apply to two or more of the fence viewers of the town where the land is situated to meet and decide the matter. The fence viewers will then divide the fence and assign to each the section which he is to build and fix the time within which the fence is to be built and file their decision with the town clerk, who will record the same. If your neighbor refuses or neglects to build his half of the fence within the time so fixed you can build it and have the expense thereof fixed by the fence viewers and certified to and then you must demand of your neighbor that he pay you the amount with the fees of the fence viewers, and if he fails to pay the same for one month, you can sue him and recover the amount with interest at 1 per cent a month.

"The Old Lines"

EVERYBODY speaks of them as "the old lines," many perhaps without realizing how thoroughly new and up to date are all these **Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano** mowers, rakes and tedders. What really good improvement was ever made in haying machines that did not show itself first on one of these machines? Where can you find mowers, rakes, or tedders that need so little adjustment, so few repairs, or that are so easy to repair when they do need it? Nowhere. These old standard machines, known to farmers for three quarters of a century, can still be depended upon to get in all the hay from any field and to make the work light for the farmer.

When you need a mower, rake, or tedder, see the local dealers who handle the **International Harvester** lines. We can remind you here that our machines have always done good work, but the dealer can show you why they still do it. You will find that the local dealer has just the size and style you need. Buy from him.

FAMILY CIRCLE TALKS BY THE PUBLISHER

YOUR FLAG AND MY FLAG.

ALL up and down this great, broad land of ours today flags are flying, public gatherings are singing our national anthem and breasts are stirred by the swelling heartbeats of a common patriotism. It gives new meaning to the poet's words:

Your flag and my flag!
And how it flies today,
In your land and my land,
And half a world away.

Rose-red and blood-red,
The stripes forever gleam;
Snow-white and soul-white,
The good forefather's dream.

Sky-blue and true-blue,
With stars that gleam aright;
A gloried guidon of the day,
A shelter through the night.

As I realize that nowhere are hearts more loyal or minds more patriotic to "your flag and my flag" than right here in our beloved Badger state, with more than one-fifth of its population foreign born and nearly one-half of foreign-born parentage, I am proud, as never before, of Wisconsin—America's greatest melting pot.

Of course, I have always been proud of Wisconsin's greatness—its greatness in men and women; its greatness in agricultural productivity; its greatness in laws and public institutions. I have wanted the world to know that it has the largest percentage of farms operated by owners and the most intensified and diversified agriculture of any of the forty-eight states. But today, more than ever, I would like to cry Wisconsin's greatness from the housetops, that all might know she is also first in devotion to the star-spangled banner and to the principles represented by our government at Washington.

You who were born here, of American parents, I congratulate, because from your earliest days you inherited through the veins of your forebears the spirit and traditions of American democracy. Even more heartily do I congratulate you, whose fathers and mothers broke the tender ties that bound them to a foreign home and came here that you might enjoy the rich blessings and opportunities of Wisconsin, which had been denied them in youth. But most of all do I congratulate you who were born in other lands, whom the guiding hand of Providence led along a path, which, though doubtless rough at times, brought you at last to fellow-citizenship in this great state.

And in the very next breath I want to acknowledge to those of you who made this the home of your adoption, the debt of gratitude which all Wisconsin and all America must feel for what you have given. I firmly believe that Wisconsin's leadership in farm products, in wealth, in good citizenship and good laws is in no small measure due to your thrift, your knowledge of scientific farming and to the high ideals which you brought here with you. Little wonder, then, that having contributed so much to the upbuilding of this state and nation, you now stand loyally together in their hour of need, upholding the institutions and the ideals which you helped to create, even as an earlier generation of Wisconsin citizens of foreign birth helped to preserve the Union in the dark days of civil war.

I think that the highest praise of all will, by common consent, be reserved for this large body of citizens who are connected by the closest ties of kinship with those whom fate has made enemies of the United States, but who, in spite of this fact, remain loyal and true to the land of their adoption. It is true that most of them came to this country to avoid the very things against which this government is now engaged in its great struggle, but that does not affect the fact that their family ties are no less tender than our own. As one of their number has so well said:

All men who are willing to lay down their lives for their country under any circumstances deserve to be enrolled as patriots. But the supreme test comes to a man when he is called upon to defend the flag, though his blood relations are arrayed against it. This is the supreme test of a man's loyalty to the flag of his adopted country.

So, with tear-dimmed eyes and hearts filled with pity, let us one and all unite in saying "All honor, then, that 56 per cent of Wisconsin's enlistments in the army are young men who are bound by ties of birth or parentage to those whom they are called upon to fight. To them belongs the highest honor, for it is they who suffer most!"

And so I greet you this week, my friends, as sisters and brothers all—sons and daughters of our common land. I care not where you first saw the light of day, or to what flag your parents first owed allegiance—I hail you as fellow citizens in this *our* state and *our* country! I rejoice that, no matter whether we have lived in monarchies, empires or republics, we are today all loyal to this government and this country, where each is the equal of a king, an emperor or a president, ready to work and die, if need be, for a land where freedom is forever enshrined in the hearts of the people, and universal fraternity, equality and liberty are the ideals towards which we strive.

I would not decry the patriotism of any other state, but when I think of the loyalty of Wisconsin's citizenship of every race and clime, I think her star must shine just a little more brightly than any of the forty-eight which cry to every breeze that blows—whether from northern Wisconsin's pine-scented woods or Florida's sunny strand, from New York's towering sky-line or from San Francisco's golden gate—the message of a united land, a common purpose and a universal hope to spread the gospel of peace, democracy and liberty throughout the world. In this mighty purpose the stars and stripes, with God's help, shall lead the way.

And so I close, with the sentiments of the remaining verses of the poem with which I began, asking and believing that all readers of The Wisconsin Farmer will join with me in them:

Your flag and my flag!
And oh, how much it holds—
Your hope and my hope,
Secure within its folds.

Your heart and my heart
Beat quicker at the sight—
Sun-kissed and wind-tossed,
The red and blue and white.

The one flag, the great flag,
The flag for me and you;
Glorified, all else beside,
The red and white and blue!

THE FARM BOY AND THE ARMY.

I AM in receipt of many letters, asking for information in regard to the new army-draft law, particularly as to the possible exemption of farmers. It may not be amiss to discuss this matter here among ourselves, to the end that all may be posted.

I am assuming that every man of the farm here in Wisconsin, who has passed his twenty-first birthday and has not yet reached his thirty-first birthday, registered under the new law on Tuesday of this week. That was his duty; if he failed to do it he is liable to imprisonment for not less than one year. But the mere fact that he is registered does not necessarily mean that he will be drafted. Let me explain the situation.

According to the best available figures, there are something like 10,000,000 young men, between the ages of twenty-one and thirty-one, in the United States. One million of this number live here in the grain belt; 230,000 here in Wisconsin. From the total number in the nation about 1,000,000 names will be drawn, within the next few weeks, for possible service under the colors. About 100,000 of this number will be from the grain belt; about 25,000 here in Wisconsin. These names will probably be drawn from a closed receptacle, somewhat similar to that from which names are taken for jury service. From the million names drawn, an army of 500,000 is to be secured. In each county there will be an exemption board, consisting of the sheriff, the county auditor and a physician. Men whose names have been drawn and who claim exemption must go before this board and make their plea. Men who are physically deficient are sure to be excused. Men who are morally deficient will likewise be exempted. Men who belong to the Quaker or Friends church, or otherwise have honest, conscientious scruples against war, will be excused. The law provides that men "engaged in industries, including agriculture, found to be necessary to the maintenance of the military establishment or the effective operation of the military forces or the maintenance of national interest during the emergency" shall be exempt. This may be taken to exempt practically all young men actively and actually engaged in farming, for nothing is more important this year than that we shall have bumper crops and that every man trained to the plow shall stay by the plow. Moreover, the law will exempt those who have someone absolutely dependent upon them, whether this be wife, child or other relative.

Let us assume that John Smith, a farm boy of twenty-five, desires to be exempted from service in the army. He has registered, as the law says he shall. The thing for him to do is to present himself before the county exemption board. He may claim exemption on several grounds: That he is a proficient, efficient farm worker and cannot be spared; that he is flatfooted or has poor eyesight; that he has a wife or a child dependent upon him, and so on and on. The first selection of names is to be twice the number actually desired for service; if more than a million names are needed before an army of 500,000 is finally secured they will be drawn as was the first lot, and so on and on, until by September it is hoped to have an army ready. This army will be trained in sixteen camps, scattered throughout the country; trained there for a half year, at least, before any active service, either at home or abroad, becomes imminent. There is little likelihood, therefore, of any farm boy being snatched away from his home, his folks and his work and being launched unto the trenches of Europe before another year, at least, has passed. I find that some of my correspondents think the parting is likely to occur almost any day now. They are wrong in this, as I have endeavored to set forth here. Even should exemption be refused by the local county board, there still remains the right of appeal to a state board and, finally, to the president himself.

As I have repeatedly said, I consider farm service fully as important and patriotic as army service: The farm boy is needed on the farm in Wisconsin this year more than in the trench and dugout. Should he want to enlist, however, he should be allowed to, for his country and his flag need him. The army might far better, however, be made up of the nonproducing boys and men of our towns and cities. The boy on the farm can do his patriotic bit as he plows the corn, feeds the stock, harvests the wheat, or performs any other necessary farm work. He is doing just as much toward bringing the war to an end over in Europe as though he were firing a bullet straight at the heart of the enemy.

I hope my readers will continue to write and ask me for information on this all-important subject. I shall give it to the best of my ability. When I cannot answer the questions myself I shall call on army friends to help me. In this crisis we must all serve as best we can.

EDUCATION AND THE WAR.

A FEW weeks ago I attempted to give a definite idea of what constitutes education, arguing that a college training is not an absolute essential to success in any line, be it farming or anything else. Some of you may recall that I said that a good education, in a general way, may be defined as "anything which we know and which we use to make ourselves better in our chosen line of work and more useful to our fellow men." I am indebted to a subscriber, Mr. J. F. Beeman, for a letter, in which he gives a definition of education, so far superior to mine that I pass it along to you with the greatest pleasure and without any delay whatever. Let me quote Mr. Beeman's letter somewhat at length, as follows:

I have been made sad many times when I knew that some farmers stinted themselves in the comforts of life to be able to send their sons and daughters away from home to get a higher education, which, when obtained, filled them with egotistical pride, causing them to look down with disdain upon the tillers of the soil. I have no doubt about this kind of an education being one of the principal causes leading the youths of the farm to the cities. This seems self-evident, being noticed by so many reliable people, and has given rise to the slogan: "Back to the farm." Book learning is very important, and parents cannot make arrangements too soon for every child to begin in a careful way after he is five years old. This beginning may be made at home, if no other facility presents itself.

Once I heard W. J. Bryan make a speech after his voyage around the world. In speaking of the education of Americans, he said that no person had a complete education "until he had learned to produce something." This statement, coming from such a prominent man, is of great importance. By the severest test that was ever placed upon civilized countries, Providence has visited the great nations of the world with the greatest plague that the world ever knew, bringing all classes of men back to the plow to get relief from the impending danger of starvation. However, the American nation has been looking ahead for several years to the improvement of the agricultural interests. The advocacy for better farming and for more men to follow the occupation of farming has been the agitation for a number of years.

However, notwithstanding this call by federal and state governments, farm journals, agricultural schools and some very prominent men, only a comparatively

(Concluded on page 5.)

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address

THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin Legislature.

An earnest effort will be made to clean up the remaining bills before the senate and assembly during the current month. All bills are to be referred to the calendar after this and committee hearings abandoned altogether. Either house acting as a committee of the whole will discuss the more important measures as they come up.

The expected liquor legislation which was to have been introduced through the senate now appears hopelessly lost for the present session, as under the rules a two-thirds vote of that body must be in favor of any bill introduced. Should any bill be proposed it is likely that under this rule it will come to grief here the same as it did in the assembly some time ago.

Senator Baxter's bill providing for the establishment of a state tuberculosis sanitarium in northern Wisconsin and making an appropriation of $75,000 for the carrying out of the bill was passed. The bill transferring police powers from the University of Wisconsin to the department of agriculture has been advanced and looks now as though it will be passed within a short time. This transfers to the state department of agriculture the inspection of feeds, fertilizers and seeds and the work of the stallion registration.

Agricultural representatives in Wisconsin will be increased to twenty-eight by a bill just passed. These agents will be supported by the state by an appropriation to meet the appropriations made by the university for the same work. This bill adds three to the list of twenty-five representatives authorized under bill 117 S. previously passed by the present legislature. This means permanent, not emergency, county agents.

The bill to increase the width of sleighs was killed in the senate last week. The state trade-mark bill for butter and cheese was also killed and in its place a resolution has been introduced to have the dairy and food commission investigate the practicability of such a trade-mark and to report to the next legislature.

The assembly passed the bill empowering county highway commissioners to remove fences from highways in the county or state system whenever a fence encroaches upon any highway on the county or state system. When such an order has been served upon the owner of a fence by the commissioner and the fence is not removed after thirty days the commissioner can have it removed and charge the township in which such lands are situated.

Senator Wilcox introduced a bill some time ago which aims to promote development in northern Wisconsin. The bill is not far enough advanced to predict its passage. It provides that whenever one-half of the landowners next to a proposed highway shall file a petition with the town board, highways shall be built during the current year. In the petition a release of the right of way on the lands owned by the petitioners must be included. No highways are to cost more than $750 a mile and no more than six miles are to be built in one township in any one year. The first one-third of the cost will be carried by the landowners owning one-half mile on both sides of the highways. Another third of the cost will be raised by a tax on all taxable property of the township. A county tax takes care of the remaining third. The landowners thus pay one-third of the costs of these highways, in addition to their share of the town and county taxes on their holdings.

Vital Topics Discussed.

The Wisconsin Farmer wishes to take this occasion to promise that all the big, vital topics of the nation will be taken up and discussed (impartially and always from the farm viewpoint) from time to time during the coming year. Our readers will recall that we devoted many columns to explaining the workings of the federal farm-loan law; that now we are explaining the workings of the army-draft law, the manner in which Liberty bonds may be subscribed for, and so on and on. We believe it to be the province of a farm paper such as The Wisconsin Farmer to keep its readers posted on every national question which affects their interest and welfare.

This being the case, we are confident that no present subscriber can afford to miss a single issue of The Wisconsin Farmer. See to it, therefore, without delay, that your subscription is paid in advance at least one year, longer if possible. See to it, also, that your friends and neighbors, who are farmers, likewise subscribe, for the paper will be just as valuable to them as it is to you.

Renew your subscription promptly; it will insure your receiving every number of The Wisconsin Farmer at a time when practically every issue of the fifty-two is worth the entire year's subscription price.

With Wisconsin Food Agents.

Wisconsin emergency food agents, taking the place temporarily of the county agent, whom we hope to see firmly established in many more Wisconsin counties later, are on the job. These men have furnished some valuable thoughts and information for the farmers of the state. Our readers will well remember John D. Imrie, who has been prominent in institute work and who has accepted the emergency food agent job for this year in Monroe county. He gives us some good ideas as to how the farmers of his section of the state (and many other sections may well heed his advice) may show their patriotism and safeguard the nation's resources. Read the following:

Don't sell short on food or live stock. Remember that there will be another year of high prices.

See to it that no bare spots are left in the pastures—sow soy beans or rape where the clover has been winterkilled.

Do not sell low on dairy cows. Remember that the milk of a dairy cow furnishes in her lifetime seventeen times as much food as her body will furnish.

Fill the silo. Silage is the cheapest food for making milk, and milk, butter and cheese are the best human foods.

Care well for the pigs. Keep them growing. Report at once to the county agent the first sign of cholera.

These recommendations come from a lifetime of farming experience and they are sound. Every reader of this paper will immediately recognize them as such.

In Dane county, A. L. Stone, known as the weed fighter, is also busily engaged and he sends The Wisconsin Farmer the following:

Hundreds of our acres of pasture and meadow land are being plowed and put into grain and forage crops other than grass and if the season is favorable Dane county will certainly produce its share of the food required in the present emergency.

All these surplus crops must be properly cared for or the seed and the effort in preparing the ground for them will be largely wasted. Maximum crops can be secured only by correct and timely cultivation.

The right kind of cultivation accomplishes four things of great importance to the crop. First, it helps make the plant food in the soil available for plant use; second, it puts the soil in condition to be warmed and aerated more rapidly than would otherwise be the case; third, it keeps a soil mulch on the surface to prevent the escape of moisture and keeps the large share of it in the soil where the plant can use it in its life processes; fourth, it kills the weeds which if allowed to grow to full development would crowd, dwarf the crop and rob it of much needed plant food and moisture.

To secure the best results this cultivation should begin early and continue until the need for it is over or the crop is "laid by" for the season.

Within five days after planting corn and potatoes should be dragged with a spike-tooth harrow, crosswise of the rows, especially if corn is drilled in. By that time the young weeds will be started, and at no time can they be killed more easily than when they have just started to grow. If a rain has fallen it is especially needful to harrow as soon as the soil will permit in order to restore the soil mulch and preserve the moisture. More will be said about cultivation later, but be sure to harrow the corn and potatoes at least once before they appear above the ground.

The year 1917 will be unique in the agricultural annals of the state in that experimental work will be given a wider scope because of the fact that most of our workers are to spend their time in the fields. While there may be some slackening in the experimental work at the station, our experiment workers will obtain a wealth of first-hand information from first-hand contact with farmers of every corner of the state. This information and experience should be of untold value in the future experimental station work.

Keeping the Roads in Shape.

The Highway Magazine has called attention to the bad roads of late spring and early summer, due to the freezing and thawing of springtime, and the rains in May and June, and the chopped-up condition of the dirt roads due to the narrow-tired wagon, which in many cases literally plows the roads into the semblance of a bog. The Wisconsin Farmer takes the liberty of quoting from The Highway Magazine:

The effectiveness of the admirable patrol system of maintenance, now happily being adopted in many states, is demonstrated most clearly during the winter and spring. A little timely work in caring for a threatened culvert installation or in clearing away mud and weeds from the mouth of a drain may save very serious damage to the road. A stitch in time saves ninety and nine in highway maintenance.

A patrolman can do a great deal with ordinary hand tools in the construction of temporary turnoffs to carry the water away from the middle of the road. He should, of course, make frequent inspections of bridges and note the possible weakening of timber structures by decay or the undermining of foundations of masonry by stream wear. A careful noting of cracks appearing in concrete structures, as a result of settling foundations or frost upheavels, may make it possible to take remedial measures before it is too late.

Corrugated iron pipe is likely to require very little attention of this kind, since its peculiar construction renders it practically immune to damage from settling fills or the heaving of the soil caused by freezing and thawing. This also should be carefully watched for signs of deterioration from rust. It seems to be the fact, however, that iron of the highest purity is capable of giving very long service in the form of road culverts.

As soon as the snow is gone and the water has settled or evaporated sufficiently to do away with thin mud, but by all means before it has become thoroughly dry, the road drag should be energetically employed. This will erase the ruts and holes produced by the traffic while the road surface was soft, and should result in an even crown which will efficiently shed the water of the spring and summer rains. After each of these, before the road surface has had time to completely dry out, the dragging should be repeated. If this is done intelligently and persistently, it is astonishing what an improvement can be effected on the ordinary earth roads which form such a large proportion of our mileage. The King road drag and the later more elaborate developments of the same admirable tool have been in use for fifteen or twenty years, but it would seem from the condition of thousands of miles of dirt roads in various parts of the United States that there must be a great number of road supervisors who never heard of such a thing. This is one of the mysteries of our American system or lack of system. The only explanation of this surprising ignorance of a practical and valuable method would seem to be that, as a class, highway engineers of technical education are making the great mistake of centering all their interest on the building and maintenance of expensively surfaced roadways and regarding the earth roads as unworthy of attention until such time as they can be entirely reconstructed, and that the local untrained road officials, to whose lot falls the care of this highly important portion of our road system, are not sufficiently in touch with one another and with the things which have been accomplished by the most progressive supervisors. The remedy for this, as for the other shortcomings of local popular government, is an unremitting publicity.

These observations are especially pertinent in Wisconsin in a late season like this has proved so far to be. It will take a little extra sacrifice on the part of our people to keep up the roads this year—extra sacrifice for the reason that men and teams are scarce. The Wisconsin Farmer believes that it is economy to keep the dirt roads of the state in as good condition as time and horse power will permit. We cannot afford to neglect our roads, bridges or culverts even in an emergency like the present offers.

Disinfecting Hog Quarters.

In a recent issue of the Berkshire World, Dr. A. C. Spivey discusses the question of "hog health" in a most interesting and instructive manner. Many phases of ill health are referred to, but this time we desire to quote what Dr. Spivey has to say relating to the problem of controlling worms and lice. On this topic he says:

Worms thrive and prolong themselves in the old litter in feed lots and beds. The common round worm, the thorn-headed worm, the lung worm and kidney worm, the worm producing mealy pork, and all parasites that prey on hog life each has a distinct life circle. A part of this circle of life in the parasite is spent in the insanitary conditions in the life of the hog. For instance, the common round worm, which is so prevalent in this part of the country, has a life history as follows: The male and female become adult worms while in the small intestines of the hog. Here they copulate, the female lays a host of eggs. These are passed out with the manure and drop to the ground. In the insanitary feed lot these eggs mix with the litter and consequently with feed and are again taken into the stomach of the hog, where they hatch and pass on back to the small intestines, where they begin a new life cycle. What is true of this parasite is generally true of all worms.

Don't you see from this history the necessity of cleaning all litter and frequently removing and replacing the bedding? Not only rake this litter and bedding up in a pile in the center of the feed lot or to one side of the door of the hog house, but at once haul the same out to some field where the eggs will be lost and the hogs or pigs saved from the infestation. The point should be well taken at this time that too many hog men, in cleaning out used bedding or, raking up litter, leave the same in the lot, where the pigs are constantly running, and where the pigs have only to walk or mess over the refuse to carry it on their feet back into their beds and their troughs. Such a raking and hauling should be followed by sprinkling on the cleaned ground and house floors a 3 to 5 per cent solution of some good standard disinfectant. Follow up with lime. We would like to add here that it is the cracks and crevices, corners and remote recesses that need the particular attention. Don't attempt to apply sanitation to a hog house or feed lot or trough by just merely cleaning around the center. That part is apt to need it the least. It is that litter that is lodged in the corner under the sill that needs to be dragged out and its resting place treated to your antiseptic and lime.

It is scarcely necessary to emphasize the points referred to by Doctor Spivey. The necessity for cleaning and disinfecting pens and yards was never more urgent than it is at the present time, because, apart from the large profits that will result from giving hogs good care, there are patriotic reasons why the supply of human food should be added to as much as possible by every man engaged in its production. Worms and lice lay a heavy tax upon the stockmen of the corn belt and the free use of disinfectants, as above stated, will do much toward the elimination of these pests. By spraying the yards, troughs and pens occasionally, these parasites can be controlled, and in this connection it should be added that no investment can be made that will equal that involved in the purchase of a hand spray pump, so that the stockman is equipped to periodically give his live stock quarters a good drenching.

It is true that the so-called hog oiler is proving to be a great boon to swine breeders in their efforts to destroy lice, but in the fight against worms, the spraying system cannot be too strongly endorsed. The use of the spray pump in conjunction with the production of pork at a much less cost than can possibly be made where these parasites are allowed to develop in their own sweet way.

The State Council of Defense has passed a resolution urging the highway commission to go slow in road work this year. The council does not advise the stoppage of all road work. On the contrary it advises that the present roads be kept in repair and that road organizations be preserved in so far as possible in each county and town. But when it becomes plain that men and teams are needed for farm work the council advises that the farm work be given preference.

FAMILY CIRCLE TALKS—By The Publisher.

(Continued from page 3.)

few of the American people realized the importance of this advice till the crisis was right at our doors. This panic for bread is good schooling for the rich as well as for the masses of the people. It is very sad to think that the earth had to be purged from its dross by the flow of rivers of blood; but these experiences, learned by this great world war, are the greatest incentives for better farming and better living in all civilized nations.

I take off my hat to Mr. Bryan in his definition of an education. Certainly, no person has had a complete education until he has learned to produce something. And when I see the cigarette-smoking college boys loafing around our city pool halls, producing nothing but laziness and obscenity, immorality and vice, I wonder if the college of hard knocks, producing men and women who can support themselves and fill the mouths and clothe the bodies of the dependent world, is not a much better educator, in the way of "producing something," than many of our colleges and universities, with their high-brow degrees. Send your boys and girls to high school and to college, if you can; but do not despair if you cannot, for they have an education open to them in the fields, even on the city pavements, an education which may produce something really worth while in the years to come.

Mr. Beeman gives us another splendid thought in what he has to say of the moral lessons of the great war. Perhaps the world is being purged, all for its own good, of much of its dross and selfishness, its extravagance and intemperance, by the rivers of blood, the blood of boys as bright and as full of promise as yours and mine. The world has advanced, century by century, through suffering and bloodshed; history may be repeating itself even now, in the titanic struggle across the seas. Not a nation in arms but has learned to know the corrupting evils of intemperance and extravagance since the war began. We bid fair to learn the same lessons here in America before the war shall end. Many and many a man will go to his death before all our drones learn to do their share in the harvest field, but good may come of it all, as Mr. Beeman so feelingly puts it. There is consolation in the thought; let us hug it to our breasts and take solace from it, even in the midst of alarms and grief and sorrow.

COME BACK TO THE FARM.

MANY a farm home here in Wisconsin has sent a boy or a girl to answer the call of town or city. Now the call is for that boy and that girl to come home—back to the farm, which stands sorely in need of them. Never was there a time, in my opinion, when it was so important that the prodigal son and the prodigal daughter should return to the farm, and help father and mother in the work which must be done, if we as a people and we as a nation are to live up to the full measure of our duty and our responsibility.

I wish that I might climb the dingy, winding stairs and knock at the dingy door, behind which sit all too many of the boys and the girls who have quit the farm for the city, only to find their dreams of bright lights and unending pleasures rudely shattered before many days had passed. The big men and women of our land have come from the farms and small towns, I will admit that. No one knows this to be the case better than I, for I have investigated the subject thoroughly and written on it often. But for every farm boy and farm girl who succeeds in the outside world there are literally a score of thousands who find no greater opportunity in the city than they would have found on the farm, who go through life merely as the background (useful, to be true, but not dramatic or inspiring, as were the boyhood or girlhood dreams) against which stand forth the few notable figures of exceptional success. For every paean of praise sounded for the farm boy and the farm girl who win fame and fortune there are a million heartaches for those who do not win fame and fortune, who go through life wishing they had never left the old home and the farm folks, yearning for the sight of growing things, the fragrant smell of the fields in early spring, the sound of the cattle and the horses and the hogs in the feed lot or pasture.

To all those who have made the mistake of going from the farm to the city, even to those who have won fame and fortune sufficient to offset the heartaches and the loneliness and the selfishness of the city, I recommend these verses, which I clip from The Saturday Evening Post, entitled, "The Call of the Farm." Read them; every word is true:

Long have you worked in the grimy mills,
  Long have you toiled in store and shop;
Going the gait that blights and kills,
  With never an hour to stay or stop.

Son of the farm, come back to her now;
  A brush-smoke odor is in the air;
The redbreast follows behind the plow,
  And sweet the savor of country fare.

Don't you remember the cedar lane,
  And hedge where the brown thrush built her nest?
Come and visit these haunts again;
  Oh, come and loaf in the shade, and rest!

Come; let the pallor and bleach of Town
  Turn in the sun to wholesome tan.
Once more, hearty and hale and brown,
  Feel and look like a countryman.

A bed in the farmhouse 'waits you now;
  There's an extra horse in the stable, too,
And in the barn is an extra plow,
  And we have happiest work to do.

Not one of us here is very poor;
  Not one has splendor and wealth and pride;
And every home has an open door
  And honest friendliness inside.

The folks will be glad to shake your hand,
  And glad to hear what you have to tell
About the people in cities, and
  The wondrous things that there befell.

We miss you more than you know, my lad;
  And after supper, when work is done,
We sit and wish for you awful bad!
  Come back; come back to the farm, my son.

America has need of every farm boy, of every farm girl, this year. There are battles to be fought in the cornfield, in the wheat field and the feed lot, over the hot range in the kitchen of many a Wisconsin farm home in canning season, upon which the fate of the world and of civilization depends fully as much as the battles fought along the Somme or even along the Rhine. Come back to the farm, you wandering boys and girls of the countryside; do your bit here, gladden the heart of father and mother, put the stars and strips triumphant and make the whole wide world better and brighter because you undid a mistake before it was too late. This is the call of the hour, a call which I hope will not fall on unhearing ears.

James M. Pierce

GROWING AND HANDLING ALFALFA

IMPROVING by having others criticise is one of the ways in which the Swartz Brothers, of Waukesha, Wisconsin, claim to have grown into the reputation of being the premier alfalfa farmers of the middle West. In a day's journey over the 500-acre farm run by these boys the visitor is constantly invited to question methods and practices followed by the owners of these farms.

APPLYING AIR-SLAKED LIME WITH A MANURE SPREADER.

BALING ALFALFA IN FIELD ON CORNFALFA FARMS.

The visitor begins his day when he steps off the train and is greeted by one of the partners, Peter or Lewis or Jayson, and enters the machine which takes him out to the farm. The conversation will soon turn to alfalfa, and, as the different fields along the roadside come into view, details fairly flow out at the least suspicion that the traveler is interested.

The brothers took hold of this farm about eleven years ago and as a starter gave it a name which is at once distinctive and expressive. They named it Cornfalfa and secured the national rights which protect the name from being used on any other farm or establishment in the United States. Nowhere else in America can this name be applied. If you don't believe it try to label your next sausage output Cornfalfa sausage and see what trouble you get into.

The alfalfa area varies between 150 and 200 acres. Old fields are plowed under and new fields prepared each year.

With the Swartz Brothers, work on the alfalfa field begins with the fall plowing. This is done by tractor. During the winter lime is hauled to such fields as show signs of acidity. The lime is the air-slaked kind and is allowed to slack still more in piles, the piles increasing considerably in size during the process. It is the pea lime from the lime kiln and is applied approximately at the rate of one and a half to two tons to the acre. In spite of numerous statements against the use of the air-slaked lime for alfalfa fields the Swartz Brothers have found that, properly applied, it does not injure the soil or the crop through too rapid action. The fields certainly bear out this statement. The lime is applied with manure spreaders.

The next process consists of thoroughly disking the ground in the spring. If the field is a new one and has never had alfalfa on it before, the process of inoculation follows the disking. Sweet clover soil or soil from old alfalfa fields properly dried and worked into fine particles is broadcasted over the land at the rate of 500 pounds to the acre. A man precedes the harrow and, like the sower of old, casts the soil for inoculating the field over the ground. The harrow following it covers it up immediately and prevents the sun from destroying its useful purpose. Then follows the corrugated roller or planker which makes the seed bed firm and smooth.

At the same time the nurse crop of oats, barley or wheat is sown at the rate of one bushel to the acre by the drill. The alfalfa is seeded in amounts from twenty to twenty-five pounds per acre. The new fields which have not had alfalfa seeding on them before are given the twenty-five-pound rate. All old fields receive only twenty pounds.

FIRST CROP IN BARN, SECOND IN STACK AND THIRD IN THE CUTTING.

In cutting the nurse crop the stubble is left standing ten to twelve inches from the ground. Thus the alfalfa has a better chance of escaping the strong rays of the sun and jumping to a sufficient growth by the time the extreme hot weather is on so that it will not die of lack of moisture. In winter the stubble of the nurse crop serves to hold the snow in a manner which protects the field from bare spots and extremely cold, killing frost.

The second year the stubble is still on the job to assist in the curing of the first crop. The first crop comes during the rainy season and needs every possible advantage in curing. Excessive moisture is readily taken up by the dry grain stalks and the crop aided materially in curing rapidly and properly. The presence of this dry

stubble in the first crop is in the eyes of the Swartz boys a blessing rather than a bother. According to them, the first cutting is ready for the mower when the young shoots start out on the crown and are from one to two inches in length. This will occur during some years when the blossoms are partly out and sometimes when no blossoms or only a few are showing. As a rule, this comes at about the middle of June. The crop is never cut shorter than three to four inches from the ground.

UTILIZING THE SAME LABOR THAT STACKS TO PUT HAY IN THE BALER

The second cutting comes about forty days later and is allowed to mature somewhat longer than the first. The third crop is pastured with cattle or sheep. When three crops are made into hay from the same field during one year the second crop is cut early enough to permit a third crop to be made by September 1st.

The Swartz Brothers have made a rule to pasture no field for the first three years. After that they consider the alfalfa well enough established to permit pasturing without serious injury to the crops.

Various fields have been cut only two times a season for a number of years. It has been found that for a period of five years a field with two crops taken off of it each year will yield as much, if not more, than a field cut three times each season. The big advantage in harvesting only two crops from a field is the insurance against freezing out, either in whole or in part. A third crop brings with it the danger of a short stand, as the only protection against the snow and ice and thawing of the winter and spring months. Since two yields will total as much hay over a period of four and five years as three cuttings per season, the extra insurance against freezing out ought to be a strong factor in favor of only two cuttings.

The Swartz boys are not afraid of experimenting a bit now and then in order to prove debatable points to their own satisfaction. They have a field of fifteen acres some distance away from their own farm which has grown alfalfa for seven years. When they took hold of it eight years ago it was a thistle and weed patch which no one in the neighborhood cared to rent at $5 an acre. The Swartz boys took it and without even troubling to put on manure seeded it to alfalfa. For thirty-five years this field has had no application of manure, yet the alfalfa is growing splendidly and yielding better instead of declining. It is the intention to run this field as long as possible without adding any fertilizer to the soil. The boys want to see how long it will take until alfalfa has sapped the field of the necessary constituents for plant growth. Each year, of course, the alfalfa adds nitrogen to the soil. But phosphoric acid is also a necessary element and this the plant roots draw from the soil without replenishing it. How long it will take the alfalfa field to use up the available phosphorus of those fifteen acres is a question that the brothers want answered. The boys think that the well-rooted alfalfa plant is going into depths and bringing up phosphorus which is not available to other plants because of their shallow root system. The lowest yields have been five tons to the acre for two cuttings.

TEN DAYS DIFFERENCE IN THE CUTTING OF ALFALFA.

Alfalfa silage has been tried successfully for two years at the Swartz farm. Each year about 700 sheep are fed during the winter on alfalfa silage and alfalfa hay. The combination is, according to Mr. Swartz, an excellent one and sufficiently balanced to feed sheep on it alone.

The alfalfa is baled right in the field and stored in big stacks for sale and for feeding.

An interesting experiment now going on consists of twenty plots, each one-twentieth of an acre in size. Each plot represents a variety of seed truly representative of its name. Kansas seed known to have been raised in Kansas grows beside the excellent Montana seed. Strains of Grimm alfalfa from Minnesota and seed from South Dakota occupy plots next to imported Turkestan. Cheap seed and the highest-priced seed on the market grow side by side, sometimes evidently forgetful of the fact that higher-priced seed ought to excel cheap seed. In another plot strains of Wisconsin-grown alfalfa show up favorably alongside of highly recommended western varieties. However, Mr. Swartz is going to conduct the experiment on a more extensive scale. In a patch of ground prepared this year 100 good-sized plots will be marked and seeded to alfalfa from every state of the Union. Wherever a variety is claimed to exist it will be searched out, inspected and approved and then seeded for comparison with other varieties.

There are a dozen different things of interest on Cornfalfa Farm and each is worthy of a story in itself. A day spent with the Swartz Brothers is a day well spent.

The National Dairy Show of 1917.

To the Editor:—This year's show will go down in history not only as having been the greatest dairy show of all time but as the most useful show ever held for agriculture. The demands now so insistently being made upon our people to produce food must reach the inner consciousness of every dairy farmer and make him feel that the call is personal to him and that therefore he must put into his business those often heard of and much put off methods of conservation and development that will make of his equipment a machine of greater service to his country in its time of stress.

Milk and its products contain properties sufficient unto themselves not only to sustain life but to keep man in fighting trim. No other food can equal it and no other food production can be as quickly realized. It, therefore, seems most natural that the heaviest call will be made upon the dairy industry in this food supply question, and it is timely that every aid and assistance be rendered by our industry to our country. We are calling upon the patriotism of every man who has anything to offer to our people, be it cows, machinery or feed, that will add to our ability to meet the situation, to bring what he has to this show, and we have tendered the show to the federal department of agriculture and to the agricultural colleges for such advanced uses as they care to make of it for the benefit of our people. The show is serving a wonderful purpose each year under normal conditions, and we now propose to speed it up to meet abnormal conditions. Regardless of the duration of our participation in the war, we must be able to take care of the feeding of the people of the world for some time to come, so that we have many years before us that will call for the maximum of production of raw and manufactured dairy products.

There should be no hesitancy in any part of this great industry to rally to the flag, nor to make of this year's national dairy show an epoch maker for the material benefit of the whole country. Now is the time to conserve the heifer calf and to confine all breeding operations to securing the very highest class of offspring to be brought to full maturity. Let every dairyman put his shoulder to the wheel and see that nothing is left undone that will tend to insure an immediate full food supply, and have no fear of the future, as it is very questionable if we will again see supply equal demand for our products.

W. E. Skinner,
General Manager.

Champion Toledo

Dependable Spark Plugs

Champion Regular
Price $1.00

Perform The Most Important Function In a Car

No matter how fine and costly your car is, it is unable to budge an inch until the spark plugs give it the *life* that sends it into action.

Unerringly and with mighty vigor, Champion Spark Plugs explode the gas mixture in the cylinders—forcing down the piston—turning the crankshaft—delivering the propelling power back to turn the rear wheels.

Four out of every five cars leave their factories equipped with Champion Spark Plugs.

Avoid substitution by looking for the name "Champion" on the porcelain of every plug you buy. You can get Champion Spark Plugs everywhere—especially designed for your make of car, tractor, motorcycle and stationary engine.

Champion Spark Plug Company, Toledo, Ohio

CURRENT EVENTS

CONGRESS is busily engaged considering the war revenue measures, on which the two houses differ very materially. It now seems assured that the senate will cut down many of the house's most rigorous provisions, leaving part of the fund desired by the administration the first year of the war to be raised by bond issuance, rather than to be covered completely (as was first proposed) by taxes of various kinds. The senate bids fair to remove the automobile tax which the manufacturer was to pay and to levy a tax on cars, according either to the horsepower or the original cost, which the individual owner must pay. It will probably also reduce the rigorous and confiscatory provisions in regard to second-class postage which the house provided and remove part of the severe burden from the publications of the country. It may agree to the three-cent postage on letters and the two-cent postage on postcards and provide for most of the stamp taxes which were in force during the Spanish-American war. It will put a stamp tax on proprietary medicines, but will probably not make liquors bear as heavy a part of the burden as the lower house proposed. Taxes on sugar, coffee, tea and cocoa, far in excess of those which the house proposed, may be adopted. The senate will spend the greater part of June considering the war-revenue measure, while the house will be busy with the bill providing for news censorship and food legislation. Congress will be in session most of the summer, so as to give the president whatever aid or counsel he may need in the present crisis.

PRESIDENT WILSON was the chief speaker at the Memorial Day exercises at the national cemetery at Arlington and delivered an eloquent address in which he paid high tribute to the dead soldiers and dedicated America to respond to the call of liberty whenever and wherever it may be sounded. "In the providence of God," he said, "America once more has an opportunity to show the world that she was born to serve mankind." The president declared that while no such day as this could be without sorrow, he looked rather with envy on those who served their country in the civil war because their work for liberty is accomplished. "Any memorial day of this sort is, of course, a day touched with sorrowful memory," he said, "and yet I, for one, do not see how we can have any thought of pity for the men whose memory we honor today. I do not pity them. I envy them, rather, because theirs is a great work for liberty accomplished and we are in the midst of a work unfinished, testing our strength where their strength has already been tested. There is a touch of sorrow, but there is a touch of reassurance also in a day like this, because we know how the men of America have responded to the call of the cause of liberty and it fills our mind with a perfect assurance that that response will come again in equal measure, with equal majesty and with a result which will hold the attention of mankind."

SEVERE wind storms wrought havoc throughout Illinois, Kentucky and Indiana last week, resulting in the loss of several hundred lives and the destruction of property valued at millions of dollars. The loss was especially heavy in and around Mattoon and Charleston, Ill. The whirlwind left fifty-four dead and 300 injured at Mattoon and thirty-five dead and fifty-nine injured at Charleston, twelve miles east. Four hundred and ninety-six dwellings were demolished and 2,500 persons made homeless at Mattoon. In Charleston 1,600 are homeless. The property loss in Mattoon is placed at $1,000,000, in Charleston at $750,000 and by the farmers in the surrounding country at $1,000,000. The loss in small towns is figured at $250,000, making a total loss by the storm of $3,000,000. This spring's windstorms have been unusually severe and costly in human lives. The outside public responded liberally to the call for help sent out by the stricken towns and the authorities have the situation well in hand, although the sorrow and suffering can hardly be overestimated.

THE middle West is enthusiastic in support of the war and overwhelmingly favors the administration's $2,000,000,000 war tax bill, according to Secretary of the Treasury McAdoo, on his return to Washington, from a tour of nine states devoted to boosting the Liberty loan. The secretary said, however, that redoubled efforts must be made to assure its oversubscription by June 15th. "The purpose of the war, the reasons for America's entry into it, and the ideals for which we are fighting are generally understood; in fact, I found not a single dissenter throughout the entire trip," said Mr. McAdoo. "I was overwhelmed with messages to the president of the enthusiastic, loyal and devoted support of the people in every part of the country I had the privilege of visiting. The sentiment throughout the West may be summed up as follows: 'This war was forced on Uncle Sam. Now that he is in it we don't intend that he shall be licked!'" The secretary said he found the most gratifying disposition on the part of the people everywhere to bear the necessary additional taxation required for the war and for the maintenance of sound economic conditions in the country.

IF the administration exercises the prohibition powers proposed in the food control bill pending in congress, the ban will fall upon beer, into the production of which goes about 52,500,000 bushels of barley every year. The American people do not eat barley, but their allies in France will eat every bit they can get, and for each bushel of barley exported for food that much wheat can be kept for home consumption. A complete report upon the relation of the liquor trade to the food supply has just been compiled for President Wilson, after careful investigation by an expert. It will be used in connection with the new food administration work and in dealing with all prohibition problems arising during the war. The report is said to hold that the manufacture of whisky does not substantially affect the food supply, because corn is the chief ingredient, and the 32,000,000 bushels of corn converted annually into whisky is not an appreciable part of the country's 3,000,000,000 bushel corn crop.

PLANS to organize the women of America so that they may play a deciding part in the world war have been announced by Herbert C. Hoover, food administrator. It is the idea of Mr. Hoover to urge every woman who presides over a household to enlist as a member of the bureau of food administration, of which he is the head. Women so enrolling would be obliged to sign a written pledge to carry out the advice and instruction of the food administration and would be entitled to wear the badge of the administration. "We can eat plenty if we eat wisely," and "We must adopt the gospel of the clean plate" are two epigrammatic bits of advice the women will be asked to bear in mind. Regarding the campaign Mr. Hoover said: "Local products must be used instead of those from further afield in order to save transport and to encourage local production. During the summer season a larger proportion of vegetables should be used in order to save those staples which are more easily kept. The use of staples with which we are familiar, such as corn bread, should be encouraged in order to save those which our allies need."

THE opinion is forming rapidly among the people of Holland that the resignation of former Premier Tisza, of Hungary, indicates a serious crisis in the relations between Austria-Hungary and Germany, although the economic and military grip of Germany on its lesser ally has not depreciated. Although the reason for the resignation of Count Tisza has been announced as his opposition to the franchise reforms, the Dutch editors believe that the Austro-Hungarian desire for a separate peace, which is not opposed by the young emperor, was the real cause for the overthrow of the Tisza ministry, who was considered the creature of Germany. The interest in Germany in this situation is revealed in the report that Home Secretary Helfferich, Foreign Secretary Zimmerman and Herr Roedern, the reichstag leader, will visit Vienna. This is connected with the unconcealed anxiety in the German press. The possibility of Austria-Hungary concluding a separate peace with the allies offsets the fears, on the other hand, that Russia may be tempted to conclude a separate peace with Germany. Austria-Hungary and Russia remain the uncertain factors in the great war for the present.

This Rugged Car
Has Twice the Needed Strength

John W. Bate, in the past three years, has doubled our margins of safety. Now every important part in Mitchells has 100 per cent over-strength.

This means better steel. It means larger parts. In these times it means much added cost. But it also means a lifetime car. It means a safe, economical car. A car which has proved that it can run 200,000 miles. That means 40 years of ordinary service.

Millions in Extras

There are also 31 features in Mitchells which nearly all cars omit. Things like a power tire pump, for instance.

There is 24 per cent greater luxury than in any other car in its class.

These extras will cost us on this year's output about $4,000,000. That is, for this over-strength, these extra features and this added beauty.

All Free to You

But all this added value costs you no extra price. Note that Mitchell prices, for either size, are below most fine-car prices.

We save in our factory cost. This mammoth plant has been built and equipped to produce this one type economically. John W. Bate, the efficiency expert, has cut our factory cost in two. Even the Mitchell bodies are built here, under these up-to-date methods.

That saving pays for these extras. We save all waste, and spend that saving on a superlative car.

Please see that car. See how it differs from other cars you know. Note its many unique attractions. You should know these things before you buy a car.

If you do not know the nearest Mitchell dealer, ask us for his name.

From the Honest Farmers' Club.

A Few Particulars of the Activities of This, One of the Successful Clubs of Walworth County, Wisconsin.

Report of the Honest Farmers' Club.

To the Editor:—Our farmers' club is located in the northeastern part of Walworth county and the southwestern part of Waukesha county. It is comprised of members of three school districts. Our meetings are held in the rural schoolhouses of the above three districts.

We organized in March, 1916, with a charter membership of forty-five. This has steadily grown until at present we have some 125. Our dues are 50 cents for men, 25 cents for ladies and 5 cents for the school children. The children have the 5 cents fee mainly because we believe they will take more interest if they are paid members. Other methods of raising funds have been basket socials, at the various schoolhouses, in which the proceeds were divided with the school district, and also we hold an annual field day in June at which time we have several prominent speakers, band, ball games and Scotch games. To this an admission of 25 cents is charged to men. Dinner is served by the ladies for those who so desire at an additional charge.

Meetings are held every two weeks on Wednesday nights. The teacher of the districts where the meeting is held furnishes a large part of the program from the children such as recitations, dialogues, etc. Then we generally have a few musical numbers with a talk on some good agricultural subject by a member or some outside speaker. Occasionally we have a question box which furnishes a live discussion on some of our problems which confront the farmer.

County Representative L. L. Oldham deserves a great deal of credit for the success of our club, having given us several good personal talks, and has been instrumental in securing other valuable information. We held a community fair for the youngsters at which they could exhibit various farm crops, garden products, etc. Prizes were awarded. Besides being a stimulus toward the growing of these, several good points on selection of seed grains were learned by the members from the judges. Professor Rogan, of Eagle graded school, and Mr. Oldham were the judges.

The past winter the club sent flowers to the sick members, which were greatly appreciated by them.

Prof. R. A. Moore gave us a fine talk on the "Breeding and Dissemination of Grains" on March 9th. This was very highly appreciated by all who attended. As several of our members are growing pure-bred grains, it was interesting to know just how they were produced and the untiring efforts it took to put Wisconsin where it is in the production of seed grains.

About 75 per cent of our members treated their oats for smut this spring, which was brought about some by the farmers club.

This fall we aim to have a good exhibit of our produce at our county fair at Elkhorn.

The Walworth County Federation of Clubs is to purchase a lantern slide machine for use at meetings of clubs in the county. By clubs paying $8 toward purchase and express on same and slides they can use it at meetings. Slides are sent out by the college of agriculture. In this way, good instructional lectures can be given.

The young people are taking a very active part in our work and we consider it a good thing for young and old to get out together and have some good social times.

Lauren E. Husten, Pres.

[Editor's Note.—Recently The Wisconsin Farmer published a report of the Brunswick Neighborhood Club, Eau Claire county, written by Miss Mary Huntington Comings. In referring to the young people's dances an error crept in whereby the letter read "the young girls as well as the young men at the dances got drunk." In fairness to the writer of the letter and the girls too, we call attention to the fact that the reading should have been "the young men" instead of "the young girls." The Wisconsin Farmer believes that our good club people do not favor the use of liquor at dances. A good social time can be had without liquors either for the boys, the girls or the old folks.]

For Sore Mouth in Pigs.

To the Editor:—That "sore mouth" disease of little pigs is causing much avoidable loss on Wisconsin stock farms this season.

When every farmer is trying hard to save every pig in every litter because of the urgent demand for pork and pork products, it is imperative that attention be called to this disease. Hidden in the soft tissues of the mouth, this trouble is often undiscovered until too late.

Pain and swelling in the gums make it difficult for little pigs affected with sore mouth disease to nurse or eat. This is the first symptom of the disease. Later ulcers with dark red borders and cheeselike centers develop.

Death caused by absorption of poison from the sores will occur in a few days unless treatment is given speedily. Wounds to the gums caused by tooth cutting or other injury enable germs to enter and start the trouble.

When the disease is suspected, examine the mouth of every pig. Those showing sores in the mouth should be treated separately as follows:

Swab the ulcers with a solution of potassium permanganate, made by dissolving one ounce of the crystals in two quarts of freshly boiled warm water. Then wash out the mouth with this disinfectant fluid. Bad cases should be treated twice daily, and all cases at least once each day until healing is complete.

To prevent the spread of sore mouth the heads of the pigs should be dipped in the same solution, previously mentioned. Pens must be cleaned up and disinfected with some reliable commercial disinfectant, prepared and supplied according to regular directions furnished by the manufacturer.

The disease is contagious. Hence each successive litter born in a pen previously occupied by infected pigs is in danger of becoming stricken with the disease unless thoroughly sanitary measures are taken.

Dr. F. B. Hadley.
Experiment Station Veterinarian.

Daylight Saving Plan.

To the Editor:—I notice by The Wisconsin Farmer that people in our state are becoming interested in the proposed daylight saving plan and that it is largely in use in Great Britain and other European countries, but I doubt whether the way they do it there would do us any good here. The way we do here in our neighborhood, when we start digging potatoes, which is generally in October or November, we set our clock one hour ahead so we can get in ten hours of work in daylight and we think it is a pretty good idea.

The rye around here looks pretty good and if it keeps warm we might have a pretty good crop yet. Our corn is all planted and a good many acres of potatoes will be planted in June and also a large acreage of beans. Everyone seems to be trying to double the acreage of all products this year.

I am always on the lookout for my Wisconsin Farmer and glad to get it when it comes. A. J. W.

Waushara Co., Wisconsin.

Sheep For Upper Wisconsin.

To the Editor:—There is one class of live stock about which little is said, and that is sheep. They furnish the country not only with more meat, but also supply our nation and soldiers with warm, suitable clothes. We are indeed very short of wool at this time, since this country produces only about half the number of pounds required for the nation. Besides this we must figure that much more wool is now needed for our army. In what manner could farmers show their loyalty and patriotism to their country in a higher degree than by a larger production of wool and mutton? They would serve the nation in its need as well as reap a handsome profit for themselves by engaging in this industry. At the present time wool sells for from 50 to 55 cents a pound, and last year's lambs sold on the Chicago market last week for $18.35 a hundred pounds, a price never heard of before. For the two reasons stated, namely, loyalty and assistance to the nation and profits derived by the producer, every farmer, wherever possible, should keep at least a small flock of sheep in addition to his other live stock. Sheep raising today is regarded as one of the most profitable live stock industries, especially on rough, hilly land which cannot be tilled. In northern Wisconsin there are hundreds of thousands of acres of undeveloped stump and part brush land which could be utilized to great advantage for sheep raising. Clover and grass which grow so abundantly on this land would furnish ample feed for many thousands of sheep. A splendid opportunity is offered here to help the nation as well as to clear a big interest on the investment.

Another point to be considered is that in sheep raising much of the scarce, high-priced labor is eliminated. During the grazing season, if the flock is given all the pasture it needs, and pure, fresh water and salt, it is satisfied. Boys and old persons, unable to do heavy farm work, can take care of a flock almost throughout the year. It is hoped that the words "more wool and mutton production" will be written in the largest kind of type on every farm home, so that service may be rendered the nation by increasing sheep husbandry to its fullest capacity. Frank Kleinheinz.

Angus Herd is Sold.

To the Editor:—Our company recently sold two cars of pure-bred Angus cattle to go to Huron, South Dakota. I believe this is the largest sale of pure-bred cattle ever made from this county. It is our intention to replace our beef herd with dairy cows.

Depot Farms Co.
Jackson Co., Wisconsin.

To Prevent Cows Sucking.

To the Editor:—I see an inquiry for a preventive of a cow sucking herself. Take a ⅜-inch gas pipe eight inches long. Saw in one inch at each end and then saw half way on side. Take remaining half and bend back so it will hold two old bridle bit rings. Drill two ¼-inch holes clear through, about the center of the pipe, at right angles. Now, fasten this on said cow, forming a bridle bit. When she attempts to suck she will draw air in at the ends of the bit and, therefore, she cannot form suction around teat to draw the milk.

There is one objection to this, and that is if the cow has to drink from shallow water she cannot immerse her mouth deep enough to prevent air coming in at the ends of the bit.

Edgar Hansen.

New Work for the Dairy Commissioner.

During the present session of the legislature new work has been added to the office of dairy and food commissioner. Some of the bills requiring inspectors from this department have already been enacted and other duties are quite sure to follow in case the proposed bills become laws. The whey butter bill and the new test for moisture in cheese, the cold storage legislation and the transfer of the soda water licensing, and the inspection of bakeries and the confectionerers all help to swell the great amount of detail work which the dairy and food commission is held responsible for. Much of this work formerly was in the hands of the industrial commission. The transfer from that department was made in most cases on request of the associations themselves.

Only one man has been added to the force thus far and he is to take care of the baking industry. For the other extra work either no appropriation or only small appropriations have been made, barely sufficient to carry on the work in the proper manner. The men of Mr. Weigle's staff all have to be hustlers in order to keep up to the hard program which has been laid out for them.

The appointment of Leon H. Robbins as agricultural representative for Jackson county has been approved by the county board of supervisors. Mr. Robbins will begin work at once, beginning with a tour of the farming district in order to determine the labor conditions and the acreage of land in use for food production. He is well qualified for his work, having had much practical experience. Since this appointment there are now twenty-two counties in Wisconsin that are supplied with public service agents.

Badger Crop Prospects Favorable

Stand of Small Grain is Good—Clover Shows Good Promise—Corn and Potatoes Nearly All Planted —Warmer Weather Needed to Push Growth.

WISCONSIN.

Adams County.—Weather continues cold and wet. Rye and meadows look well and pastures have improved some during the past week. Some corn and potatoes are in the ground. With warmer weather all crops will promise well. The acreage of all crops will be about normal. Fruit has not been damaged by frost. The crop is average.—W. B. Barnes.

Barron County.—Since the snow last fall there has been little moisture. Pastures and meadows are backward. Small grain looks well and the acreage is about 10 or 15 per cent larger than usual. The acreage of vegetables has been increased this year. Farmers are saving a larger percentage of live stock than formerly; spring pigs are selling from $5 to $10 each. Most of the corn and potato planting is finished.—F. J. K.

Burnett County.—Five weeks of dry, cold weather with severe frosts have injured crops in this section. Pastures and meadows are dry and crisp. Fodder is scarce and many farmers are obliged to sell stock because of the continued drouth which keeps pastures from growing. Farmers are trying to increase production, but weather conditions so far are not favorable.—E. H. Johnson.

Brown County.—Weather continues cold and dry and crops are not looking very well. The stand of grain is not good and if rain does not come soon the grain crop will be light. Grass looks well, but seems to be rather short. Corn and potatoes are being planted at this time. The acreage of potatoes will be less this year on account of the high price of seed.—J. D. McAllister.

Buffalo County.—The early grain looks fine, but the late grain is not so good as it might be because of the cold weather. Corn is all planted. Pastures and hay are doing well. Live stock is in good condition; hogs are selling at very high prices. Potatoes are very scarce and are worth $3.50 a bushel.—John Wald.

Calumet County.—Spring grain looks fine. Rye and wheat are good and prospects for a large yield are favorable. Most of the corn is planted. Apple and cherry trees are in bloom. Beans and peas look well and the area planted to them is large.—Joseph Buchinger.

Clark County.—Small grains are up, but as yet are not making normal growth. Most of the corn crop is in the ground, but a few farmers are still plowing for corn. The potato acreage is greater than usual. A few warm days have brought the pastures forward, but cold rains are checking their growth again. Fruit prospects are very promising.—Louis Buddenhagen.

Crawford County.—Most of the corn has been planted and farmers are hoping for warmer weather. The acreage will be larger this year than usual. Recent rains have helped pastures and improved the prospect of a good hay crop. Wheat, rye and spring grains look fine. Several cars of cattle have been shipped in lately and are on pasture. Last week's frost did little damage.—A. M. Laird.

Door County.—Spring is cold and backward. Clover withstood the winter in fine shape and looks well. There is a large acreage of peas. Small grain is just coming up. The acreage of corn will be increased considerably. Cattle are selling at from eight to nine cents a pound. Small pigs are very scarce and sell at $4.50 each. The area planted to potatoes will be about normal.—John Azone.

Douglas County.—Small grain is backward, but there is plenty of time for it to develop into a good crop. Because of cold, dry weather, meadows and pastures are nearly a month late. Recent rains are improving these conditions. Because of the scarcity of hay and pasture, dairy cows have not done well. More calves are being raised than usual. The acreage of wheat and potatoes is larger than usual.—J. N. Ottun.

Dunn County.—Corn planting is nearly finished. Small grain looks well, but the weather is still cold. Pastures need rain and warmer weather. Several frosts occurred last week, but did no material damage. It is not likely that the acreage of grain will be increased this year because farmers have had as large crops as are possible for several years. There are a number of dairy sections in this county.—J. D. Miller.

Fond du Lac County.—Due to late season, spring grains are not as promising as usual, but are improving. Winter wheat and rye are very good. A frost on May 22d killed much of the early garden truck and injured fruit blossoms to some extent. Very little corn has been planted, but the ground is in fine condition and most of the crop will be in the ground in about ten days. Pastures and the seeding of grass are promising. Cattle suffered from cold, rainy weather, but are now improving on good pasture. Young stock seem to be more numerous than usual. Farmers in the southwestern section of this county are looking forward to the completion of the Libby, McNiell & Libby condensery to be located at Waupun.—C. A. Williams.

Iowa County.—Small grains in this section look well. Corn planting is nearly finished; that which was planted in early May was damaged recently by a severe frost. Pastures and meadows look well, but are still backward because of the cold weather. The number of young stock is about normal or perhaps a little above. The acreage of corn and small grain will be a little greater this year than last. The early fruit blossoms were injured by the frosts to some extent.—J. M. Blotz.

Juneau County.—Small grain looks fairly well, considering the backward season. The late sowing of oats is doing well. Frequent rains are keeping the ground soft. Meadows look well, but pastures are not growing rapidly because of lack of warmth and moisture. Fruit trees are in full bloom and promise good crops. Gardens need warmer weather. Considerable corn has been planted; some of it was caught in a frost on May 23d. A good deal of late corn will be planted this year. The pig crop is late, but a normal number of young stock will be saved.—C. E. Hoskins.

LaFayette County.—Weather is cold. Early planted corn is coming up. Some planting is to be done yet. Small grain looks well. Pastures and meadows are backward. Many spring pigs have died. Calves are going to market in poorer condition than usual on account of the high price of milk. Fruit trees have an abundance of bloom. There are fewer colts than usual.—W. J. Martin.

Langlade County.—Spring seeding is nearly finished and most of the crop is up. Some ground will be planted to peas this year. Farmers are still plowing for corn in some sections, but considerable of the crop is already planted. Nearly all of the potatoes are planted and the acreage of this crop will be about normal. Some new land has been cleared and will be put in corn, also old meadows that have been plowed up. Clover is very backward because of the cold, dry weather. Cattle are thin since hay, ensilage and all other feed is scarce. The percentage of young live stock saved is about normal. A special effort is being made to save heifer calves. The area planted to beans will be larger this year than last.—Chas. Lade.

Lincoln County.—On account of the cold weather, small grains are not growing well. About the usual acreage has been put in small grain. Pastures and meadows are very short. Live stock is normal in number. Cattle are healthy, but thin. More spring wheat was sown this year than usual and more potatoes were planted. There will be about a 10 per cent increase in the acreage of crops planted this year.—G. A. Patterson.

Manitowoc County.—Weather has been fine for spring sowing and ground has been in good shape. Farm work is progressing nicely; some corn has been planted. There is plenty of moisture for growing crops, but the weather is too cold. Stock are on pastures, but grass is short. Labor is scarce in some sections. The corn and small grain area in this locality will be greater than last year—from 5 to 10 per cent greater.—Edw. E. Straka.

Oneida County.—Most of the small grain is planted except some barley. That which is up seems to be doing nicely; but there will have to be rain soon in order for it to make a good growth. The acreage of grain is larger this year than usual. More potatoes will be planted than formerly and also more beans and root crops. Corn planting is nearly finished. Pastures are in poor condition, but live stock seem to be done nicely on dry feed. Young clover is making a very good growth.—Chas. H. Jewell.

Outagamie County.—Old pastures are poor, but the new seeding is good. Corn has been delayed by cold, wet weather. Late frosts and storms have damaged the wheat, rye and oats to some extent. Potato planting is well under way. Early sown vegetables will be planted over in many cases on account of damage from frost. Cattle are in normal condition. Feed is scarce and high priced.—Harry Lepplu.

Sawyer County.—Weather continues cold and dry with prevailing northeast winds, which reach a high velocity at times. Seeding is finished, but grain is coming up slowly because of lack of moisture and warmth. Clover seems to be in good condition, but is not growing well. Pastures are thin. Corn and potato planting is under way; at this time about 50 per cent of the corn and 40 per cent of the potato crop are in the ground. Unless rain comes soon further plowing will be difficult.—Jens Uhrenholdt.

Trempealeau County.—Small grains are looking well. Most of the corn is planted and some of it is up. The pastures are fine. The grain area in this locality has not been increased very much because it could not be without selling off some of the live stock. Much land is changing hands this year.—John W. Lowe.

Wood County.—Meadows and pastures are shorter than they have been for many years. Heavy frosts and cold weather damaged the rye crop about 20 per cent. Oats, barley and peas look fair. The acreage of rye was increased about 12 per cent this year, oats 10 per cent and potatoes 20 per cent. All vegetables are later than usual. Young stock are about normal, but there are more milk cows than average. Hogs are about 25 per cent fewer in number than normal. Pigs are below normal in number, but growing fine.—Peter Brown.

IN the Middle Atlantic States where farm genius succeeds at everything from fruit growing to dairying, from intensive trucking to the most diversified of general farming, Firestone Tires are held in high respect.

The sound, conservative, far-sighted farmers of this region feel a kinship with Firestone ideals, with Most Miles per Dollar and express their friendly attitude by generous buying. Try Firestone Tires and you'll do likewise.

Free Book, "Mileage Talks," No. 117 for the name of your dealer and the make of your tires.

Firestone

To Form Egg Association.

Ten million dollars' worth of eggs are produced in Wisconsin each year. Of the total production nearly 17 per cent, it has been estimated, is lost each year through various causes which are for the most part preventable.

In order to reduce all unnecessary losses to a minimum George G. Weigle, the dairy and food commissioner, has called a meeting in Madison for June 7th and 8th at the capitol building to perfect an organization which will undertake to develop and foster efficient methods on the production and handling of eggs. In a letter sent out to the egg men of the states ideas on how best to stop the enormous loss and waste through spoilage are asked for. But the commissioner does not want anyone to stop at that. He wishes to have all egg men, both producers and dealers, present at this meeting to give their personal view and aid in forming an organization through which more effective means for conservation of the egg crop can be carried on.

Speakers for the day will be Dr. Klein, of the food and dairy commission of Illinois; Commissioner Norgord and Professors Halpin and Hatch, of the agricultural college.

The dairy and food commission will not be connected with this organization in any way except in an advisory capacity when their services are asked for. The meeting on June 7th and 8th will be simply for the purpose of starting the ball rolling. Coöperation on the part of the commission will, however, be promised in advance, for anything the commission can do in the way of increasing production and preserving the product is simply in line with their work.

Destroying White Grubs.

To the Editor:—How can we farmers combat the white grub? It seems to me as a common, everyday farmer, that it is of more importance than any other matter connected with production of crops, especially corn. I understand we have to start this summer and destroy the June bug in order to be free from the grubs next year. The June bugs are already here on my farm at least and I, for one, do not relish the idea of giving up part of my crops next year to their offspring.

What distance would a light draw the bugs if a tub and lantern is set out for them as is recommended? Would one trap like that on a 160-acre farm do much good? If not, how many would be necessary? If one farmer puts out tubs and the neighbors do not, will it do much good on the one farm that sets out the tubs? It seems as if some law on this would be of more benefit to humanity than some of the laws we now have and are proposing.

In the face of this food shortage proposition it seems to me the white grub pest is not given anywhere near as much consideration as it should be. My observation and experience do not show that any method as to plowing early or late does much good. Two years ago the grubs worked in all conditions of soil and next year they will be worse, according to indications.

Mix Your Own Concrete

A Crib Fit For High Priced Corn.

A Structure That Is Time Proof and Rat Proof—Is Well Ventilated and Keeps Corn Perfectly.

IT DOESN'T pay the modern farmer to plow, disk, harrow, cultivate and harvest unless he gets big prices for his crop. Moldy corn that's docked 5 to 10 cents on the market is the result of wrong cribs on the farm. Just so will modern cribs starve out the vast army of rats which hundreds of farmers in the corn belt are fattening annually. Rats that spread plague and disease as well as eat up the profits are dangerous. Present-day crib construction immunes the cribbed corn from the invasion of mold or rot and assures the owner that every kernel will be turned into money. Farm efficiency is cutting great wide swaths into twentieth century agriculture.

Photographs here tell a story of how one Iowa company built a 10,000-bushel round crib that is fit for high-priced corn. It was built of hollow clay blocks with the open ends out and set at an angle so that the rain cannot get at the cribbed corn. It is repair and time proof and rat proof. It lessens the work of cribbing, since a small elevator in the center ventilating core operated by a small oil engine hoists all the corn to the crib from the wagon dumps. It cures corn properly and stores it with safety. It is a type of corncrib that corn-belt farmers can well afford to build. This method of crib construction can be carried out to an advantage in any sized or capacity crib. It is adaptable to the needs of the small quarter-section farmer as well as to the big farm that covers a section or more of land. It is a crib that if made in large sizes fits well the needs of the small or large elevators over the country.

Thirty by thirty-two feet is the size of the crib here shown, which gives promise to become exceedingly popular in the corn states. Round cribs need less material and have more strength than rectangular cribs of the same capacity. When the method of building becomes more generally known by builders, this type of crib will come to its own. Circular walls are easiest built of blocks and when safely reënforced in the mortar joints by one-quarter-inch wires the resulting wall is a permanent and serviceable improvement. For the foundation of cribs of this sort a two-foot-wide footing is necessary. This is eight inches thick and goes down about three feet below the grade line to insure safety from frost. A sixteen or eighteen-inch foundation wall of concrete will support the building. Use a one to five or a one to four mixture for this work. The foundation for the center ten-foot ventilating core will be of just the same dimensions as for the outside walls. In laying the foundation wall above grade the five-inch drain tile must be imbedded into the concrete. These are for drainage and also as an air space under the floor. Crib floor construction of concrete has had many enemies in the past due to the fact that it causes moldy corn. Concrete floors must be built to be dry. Good results will be secured if one follows out the details as shown here in the cross section of the walls. Keep the concrete from coming in direct contact with the soil and soil moisture. Cover the entire space with six or eight inches of coarse gravel before laying the five-inch-thick floor. The drain tile are set in first before the floor is laid and placed about four or five feet apart and run through to the ventilating core. Eighteen inch wide and eighteen inch deep shelling trenches in the floor are built in to make easy the job of shelling corn. An endless belt runs through the trench and carries out the ear corn to the sheller. Short pieces of plank are laid over the trench when being filled. It is estimated that from one-half to three-quarters cent per bushel of shelling costs can be saved in this crib. One man can roll the ear corn into the trench and feed more corn than the average sheller can handle. The walls of these trenches are of concrete or could be made up from a hollow block and thereby eliminate the building of the forms. For the floor and foundation of this Iowa crib there was required about eight yards of gravel and fourteen barrels of cement.

The walls of this permanent circular store house for corn are eight inches thick. The blocks made especially for this purpose are set at a slope of one to four as is shown. The

(Concluded on page 19.)

STAGING ON THE INSIDE WALL OF THE VENTILATING CORE AND THE OUTSIDE CRIB WALLS WERE BUILT UP AT THE SAME TIME.

COMBINED CRIB AND GRANARY: 6,000 BUSHELS OF CORN, 3,000 BUSHELS OF GRAIN.

Make the Most of Your Time

SAVING TIME is like saving money when you are threshing. You cannot afford to have all hands sitting idle waiting for your repairs. Insist upon having a thresher that will save your grain and keep steadily at work until the job is done. Hire or buy a

Red River Special

It Saves the Farmer's Thresh Bill

It is guaranteed to be capable of doing more and better work than any other machine made of like size and proportions, working under the same conditions and on the same job. It can be crowded to the limit and still keeps saving the grain. Unlike other threshers, it *beats out the grain.*

Tractor owners find an ideal threshing outfit in our Junior, the small thresher with high efficiency. Same famous features as Red River Special. Makes home threshing pay. Write

Make Your Horse Sound

By using MITCHELL'S EQUINE LINIMENT, a reliable remedy for all unsoundness that can be reached by external remedy. Especially valuable for Curbs, Splints, Sore Tendons, Bad Ankles, Sprains of all kinds and open wounds. Recommended by Geers, Cox, Dean and other leading horsemen. Don't try to market a cripple; make it sound with this wonderful remedy. $3 per bottle; trial bottle $1. Sent postpaid by Mitchell Chemical Company, Dept. 2, Altoona, Pa.

$10 for Best Pony Story

I want to find out how much you know about Shetland ponies. Where were they first raised? How big are they? Have you ever ridden one? Do you know how to take care of a pony?

These are a few of the things you ought to know about ponies. Write me all you can about Shetlands in 125 words. To the boy or girl who sends me the best story or article I will give a prize of $10.00 in gold. Get busy and write your story or article today. You can win the $10.00 prize if you try.

Beautiful Pony Given Away

You can win a beautiful pony too, for I am going to give a dandy Shetland to some boy or girl. I will tell you how you can get a pony for your very own, just as soon as I hear from you.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Igniting Acetylene Gas.

Will gas generated from carbide and water ignite from an electric spark?

Answer.—This is acetylene gas. It ignites readily from an electric spark. It is practically the same gas that is used in "Prestolite" tanks, the gas which was usd to a considerable extent for starting motors.

Moth Balls.

I would like some information as to the use of moth balls in gasoline. What are they made of? How many can be used safely in a gallon of gasoline? In a two-cycle engine, where the oil and gasoline are mixed, will they cause any trouble? Have they a tendency to keep the cylinder cleaner, or do they foul the cylinder?

Answer.—Moth balls are made from coal tar. They are not manufactured to any extent in this country. Since the war, the price has risen from 10 cents per pound to 40 cents per pound. For use in gasoline use one ball to one and one-fourth gallons. No trouble should be caused by the oil in the gasoline. Due to the more perfect explosion, there should be less trouble due to fouled cylinders. However, we have but little information on the subject and would be glad to hear from any of our readers who have tried it.

Ignition From Storage Battery.

I have a three-horse-power gasoline engine, and I would like to know if I can wire it to run from my lighting plant storage battery instead of using dry cells. I have a thirty-volt storage battery. The engine has a spark plug and a coil. I use four dry cells with it. Will I need a new coil, and what kind should I use? I have plenty of No. 12 insulated copper wire. Will this be all right for wiring?

Answer.—You can use your storage battery for ignition. Wire the storage battery to the engine and coil exactly as the dry cells are now connected, except that a coil of about 500 feet of No. 16 iron wire should be connected in the circuit to protect the coil. If your ignition should then appear to be weak use less wire. The correct amount of iron wire to use depends upon the resistance of the coil. Your present coil should work all right. You can also use the No. 12 insulated copper wire. Ignition from the storage battery is better than ignition from dry cells.

Efficiency of Gearing.

Approximately, what is the per cent of power lost in a spur gear contact; straight bevel gear, spiral bevel gear, worm gear, and roller pinion contact? How much more power is delivered when each of the above runs in an oil bath? Will a roller chain deliver more power from one shaft to another than a set of two spur gears? How much power is lost through a universal joint? Why any? How much easier does a shaft turn on roller or ball bearings than on plain bearings? Where could I get a description of the different designs of universal joints in use today?

Answer.—No definite statement can be made as to the power lost in transmission through gearing and chain drives, as the loss is greatly affected by the load, the speed, the lubrication, the size of the pulleys and other factors. For slightly lubricated gearing from 2 to 10 per cent of the power is lost. If the gears run in oil only about half as much power will be lost. The loss is slightly more for bevel gears than for spur gears, and the spiral bevel gear is less efficient than the straight bevel, the advantage of the spiral bevel being its quiet running qualities. The loss of power through a roller pinion is somewhat less than for a spur gear if the roller pinion is well lubricated and kept free from dirt. The worm gear drive is the least efficient of all, the loss of power being from 5 to 40 per cent. A roller chain has about the same efficiency as a spur gear under similar conditions.

Wherever there is friction there is loss of power. There is some friction in a universal joint between the separate parts, and, therefore, there is some loss of power. The greatest loss is at the bearings that support the shafts near the joint. This loss increases rapidly as the angle between the shafts increases. In common practice this angle is seldom made over 30 degrees, and the friction losses vary from 2 to 20 per cent. For information on universal joints write to the various manufacturers for their catalogs.

The friction is only one-fourth to one-half as great with roller bearings as with plain bearings, and ball bearings are still more efficient.

Making a Camera.

Please publish in your Farm Mechanics Department how to make a camera.

Answer.—We do not consider it practical to make a camera on the farm, as the lens would have to be bought, and the lens is the most expensive part of the camera. The shutter would also be difficult to make. A light tin box having a pin hole at one end and provision for holding a plate holder at the other may be used as a camera where very long exposures are possible.

Will Not Pull on High Speed.

I own a Model 1914 Ford car. It pulls well on low, but when I change over to high, the car begins to jerk and does not pull even. Can you tell me what is wrong?

Answer.—Your clutch is probably worn and needs adjusting. The following instructions are given by the Ford Company for adjusting the clutch:

Remove the plate on the transmission cover under the floor boards at the driver's feet. Take out the cotter key on the first clutch finger and give the set screw one-half to one complete turn to the right with a screwdriver. Do the same to the other finger set screws, but be sure to give each the same number of turns and don't forget to replace the cotter key. After a considerable period of service, the wear in the clutch may be taken up by installing another pair of clutch disks rather than by turning the adjusting screws in too far.

Five-Horse Evener For a Disk.

I want to make a five-horse evener for a disk and I do not know the exact measurements. Will you please help me out? The evener I have in mind is like the sketch below. Can you give me the measurements for this evener? I have also seen another style of five-horse evener for a disk, with one horse in the center. Perhaps you could tell me how to make that.

Answer.—We are publishing the sketch, with the addition of the principal length dimensions. It will be noticed that the disk clevis is located directly back of the middle horse. The outfit as shown consists of five twenty-eight-inch singletrees, two doubletrees forty inches long, the holes being located four inches from each end, one doubletree, B, seventy-two inches long with the end holes four inches from each end, the middle hole of both B and C being half way between the end holes, and the doubletree, A, which is ninety inches long, the end holes being located five inches from each end and the other hole sixteen inches from the right-hand end hole. The ends of the doubletrees should be bound with strap iron. The double-

trees should be made of hardwood, C being two inches by four inches, B two inches by five inches and A two inches by six inches, approximately. To shorten the hitch, C C are sometimes mounted on top of B. It will be noted that the principle of leverage in this evener is the same as was explained in a former issue. There are four horses pulling on one end of doubletree, A, and one horse on the other: 4×16=1×64.

With one horse in the middle as you mentioned, doubletree A would not be used; doubletree B would be made thirty-two inches longer and the middle horse would be hitched by a chain to the middle clevis of B. This would have the disadvantage of not compelling the middle horse to take its share of the load, but it shortens the hitch and simplifies the construction.

Come to Detroit
The Automobile Center
and
LEARN THE AUTOMOBILE BUSINESS-EARN $75 TO $300 A MONTH

Detroit trained men get preference and jobs quickly. Think what it means to learn in the Michigan State Auto School. Factories endorse our School, glad to employ our graduates or offer them territory. Men are needed everywhere as testers, repair men, chauffeurs, garage men. Hundreds of our graduates start in business for themselves.

44 auto factories in Detroit and 140 parts factories. Students get actual experience in handling all kinds of electrical auto equipment. Just installed a Sprague Electric Dynamometer for block testing purposes for students' use.

Detroit Is Place to Learn—Start Any Time

We teach you to handle any auto proposition. Students actually build cars from start to finish, getting factory training in assembling, block-testing, road testing, everything. Special complete course in Oxy-Acetylene brazing, welding and cutting, separate from regular course. All leading types of starting, lighting and ignition systems in operation. Six cylinder Lozier, eight cylinder King used for road instruction. We have the following completely equipped chasses—

Studebaker "6" 1917 chassis
Hudson Super-6 1917 chassis
Cole "8" 1917 chassis
Detroit Electric 1917 chassis
G. M. C. Truck 1917 chassis
Buick Light 6 1917 chassis
Chalmers "6-30" 1917 chassis
Saxon "6" 1917 chassis
Maxwell 1917 chassis
Oldsmobile "8" 1917 chassis
Winton "6" 1917 chassis
Packard Twin-6 1917 chassis
Detroiter "6" 1917 chassis
Overland 1917 chassis
Willys-Knight 1917 chassis

School Open All the Year. Graduate in 10 to 12 Weeks. Enter Classes Any Time, Any Day. Three Classes Daily: Morning, Afternoon, Evening.

Money Back Guarantee

We guarantee to qualify you in a short time for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, or automobile dealer, paying from $75 to $300 monthly or refund your money. We have constantly more requests for Michigan State Auto School Graduates than we can supply.

THIS IS ONE OF FEBRUARY, 1917, CLASSES.

Prepare to Serve Your Country NOW

The United States needs thousands of truck, transport, aeroplane and motor cycle drivers. Trained competent men are needed, men who can take care of the machines, men who know how to keep them in service. Any piece of motor-driven machinery the government owns or will own must be in service. Preference will be given to trained men. No matter what service the Army is doing, it must be fed. If it is on the firing line, it will need thousands of rounds of ammunition. The importance of trained men is very evident. Food and ammunition must be delivered regularly. Then too the army must often be transported.

Quartermaster Department and Signal Corps Need Trained Men

The Michigan State Auto School trains men thoroughly. Every student learns pleasure cars, trucks, motor cycles, and gasoline motors of every kind from A to Z. Graduates of the Michigan State Auto School are in big demand by the leading Automobile plants at Detroit. These factories know from actual experience that our men are thoroughly, completely, and practically trained.

No matter what happens to a truck or pleasure car a Michigan State Auto School graduate is competent to repair it. Cars in the care of a graduate give highest efficiency. This is the kind of men Our Government wants and is daily enlisting. Trained men who will be efficient themselves and keep every bit of motor driven equipment in the most serviceable condition.

LEARN A SUBSTANTIAL BUSINESS

Men who become trained in the Auto Business and serve their country can go into a permanent business as soon as their services are no longer needed. The trained mechanic is always in big demand. His ability is recognized at once. Ours is the largest Auto School in the country. Better jump on a train and come to Detroit as hundreds have done.

Cushman Motor Works
855 North 21st St., Lincoln, Nebr.

UNCLE SAM WANTS AUTO EXPERTS
YOU CAN QUALIFY IN 6 WEEKS TO DRAW BIG PAY.

The government is paying high salaries to trained auto experts—to men who can drive a pleasure car, truck, ambulance, motorcycle or any other motor-driven vehicle—to men who know how to find and remedy trouble if anything goes wrong.

Milwaukee Motor School
Graduates are in the U. S. Service at good pay

Preference is always given to trained men—particularly to auto mechanics. Food, munition and supplies will be moved by men who can best drive and care for automobiles; and for such service you can draw better than soldier's pay.

We use no books—you get practical work on all makes of cars, trucks, etc—you do the work yourself under the direction of Mr. Arhelger and other auto experts.

Write us for free book and details telling how you can make big money as an auto expert.

Wm Arhelger

Graduates the Milwaukee Motor School has turned out recently have passed Uncle Sam's rigid examination for auto experts.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Wisconsin Poultrymen, Attention.

To the Editor:—An army of poultry will help win the war. Uncle Sam says: "The nation's meat supply is short. Chickens are the quickest meat crop that can be produced. Chickens require no large cash outlay. We need an increase of 100 million pounds of pou[illegible] year. Wisconsin's share is 3½ million pounds. Will you raise a bigger flock? It pays and it's patriotic."

The foregoing statements from a placard issued by the agricultural experiment station at Madison should have serious consideration from every reader of these lines.

At Chicago was recently held a nation-wide poultry conference with delegates in attendance, representing organizations of every branch of the poultry industry, the purpose of the meeting being to organize a campaign to increase the production of poultry and poultry products and to facilitate the handling of the same as a means of relieving, so far as possible, the shortage of food supplies which is now being felt and is sure to increase.

Pres. E. E. Richards, of the American Poultry Association, was in attendance and was directed to enlist the coöperation of the 8,000 members of this association to assist in producing the additional 100 million pounds of poultry for 1917.

We are resolved that Wisconsin shall not be found wanting in the production of the extra 3 million pounds, which is her share of the sum total. To accomplish this we must have the earnest coöperation of local poultry associations and of raisers of poultry on farms and elsewhere who are not affiliated with local associations.

The poultrymen of Pennsylvania are offering 50,000 eggs free to boy scouts and boys' and girls' clubs of the state. This is patriotism and it is hoped that our Wisconsin poultrymen will meet every similar request. Our newly organized boys' and girls' clubs are reporting good work, but in many instances hatching would be continued later if eggs were offered by our poultrymen to these club members.

Broilers can be produced weighing from one and one-half to two pounds at from eight to twelve weeks and layers and roasters in from four to seven months. There will be good profit in these, even with the present high price of feeds, but the thought that should be foremost in the producer's mind is to feed the hungry. As a nation we have been very wasteful and millions of dollars' worth of food is consigned annually to the garbage can that should be converted into wholesome food by way of poultry products.

A poultry house sufficient to care for a small flock in town need not be expensive. A piano box may be so arranged as to accommodate a dozen fowls and may be neatly arranged.

In many instances it will be advisable for beginners to purchase day-old chicks, which with good care will come to laying before cold weather sets in. Avoid losses by controlling parasites that annually kill thousands of chicks and keep quarters clean to prevent disease. Reader, this is a personal appeal to you, not only to do your duty but to encourage your neighbors and friends to do likewise. The Wisconsin Poultry Breeders' Association are ready to lend their assistance in furnishing eggs at a nominal cost or where necessary to contribute them free of cost.

The poultry department of the agricultural college at Madison are asking opportunity to advise and assist you to succeed with poultry if you are inexperienced. Never before has the value of the hen been so much appreciated and never before in our history, as a nation, has the shortage of a food supply been so apparent. Wisconsin must do her full duty.

Geo. W. Hackett.
President Wisconsin Poultry Breeders' Association.

Feeding Poults.

Improper feeding, combined with close confinement, has been the cause of many failures in turkey raising. When on free range the poults are busy searching for feed most of the day. Here there is no overfeeding and lack of exercise, such as the poults are often subjected to by those ignorant of their wants. If the range is plentifully supplied with green feed, grasshoppers, and other insects, and if the weather is favorable, then the best plan is to allow the poults to feed themselves. It is usually advisable, however to have them come home at night, and if driven up and fed at a certain place every night, they will soon learn to come up themselves.

When, on account of rainy weather or unfavorable range conditions, it is advisable to raise the poults by the coop method, more care must be given to their feeding. For the first two days after hatching, poults require no feed, the yolk of the egg which they absorb before breaking out of the shell being sufficient to maintain them for that length of time. Access to clean drinking water and a little coarse sand and green feed to pick at is all that is needed until the third day. Beginning with the third day, the poults should be fed according to the quantity of natural feed they are able to pick up outside the coop. They should always be hungry. To feed all they will clean up several times a day removes the cause of searching for feed, so that little excise is taken and indigestion is sure to result. When natural feed is scarce, or when the poults have to be kept from ranging outside, they should be fed lightly about five times a day. If allowed to run outside the coop, where they can find insects, seeds and green feed, they need not be fed oftener than tw or three times a day.

Successful turkey raisers use many different kinds of feed, some of the most common being as follows:

1. Hard-boiled egg chopped fine and cornbread crumbs for the first week, and then whole wheat and hulled oats.
2. Stale bread, soaked in milk and squeezed dry, for the first few days, andthen common chick feed.
3. Clabbered milk seasoned with salt and pepper, cornbread crumbs.
4. Equal parts "pinhead" oats, whole wheat and cracked corn.
5. Cracked wheat.
6. Corn meal and wheat bran mixed in the proportion of three to one and baked into bread.
7. Bran or middlings one-half, cracked Egyptian corn one-quarter, wheat and hulled oats one-quarter.

In addition to the above, skimmed milk and buttermilk are quite often fed, with excellent results. A good plan is to keep the milk in front of the poults during the morning and water during the afternoon. If grit and green feed cannot be picked up outside the coop, they must be provided in some other way. Chopped onion tops, lettuce leaves, dandelion leaves, and alfalfa make excellent green feed. Grit can be furnished in the form of coarse sand.

While confined to the coop, the mother hen should be fed twice a day on a mixture of grain, such as equal parts corn, wheat and oats, and green feed, while water and grit should be kept before her all the time. An occasional feed of meat scrap or fresh, lean meat is greatly relished and helps to keep her in good condition. In feeding the hen and poults, it is advisable to feed the latter outside the coop and the former inside, in order to prevent her from eating the feed intended for the poults. It is seldom necessary to keep the hen and poults confined for more than a few days at a time, and the sooner all can be given free range, the better. Whether or not they should be put into the coop at night after ranging during the day depends on the weather and the danger from predatory animals.—[Bulletin.

FARMERS' MARKET

Wanted—For Sale—To Exchange

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

The Wisconsin Farmer, Madison, Wis.

FARM LANDS.

NORTH DAKOTA, most successful agricultural state in the Union, producing as many dollars per acre as states where land sells four times as high. In past five years held first place every time in production of wheat and flax; and once in barley. In climate, soil, crops, railroads, schools, roads, North Dakota exactly as good as best in Illinois, Iowa or Minnesota. You can obtain a home there without commission to us, while land is still cheap. Easy terms. Write at once for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Bldg., Minneapolis, Minn.

RUSK COUNTY LANDS! In the great potato-growing district of Northern Wisconsin, offer great opportunities for industrious farmers. We want people, looking for homes, in this ideal, partly timbered district, to write us so that we can tell them why it is to their interest to buy their lands of us. Send name and address today. Flambeau River Lumber Co., Owners, Station D, Ladysmith, Wisconsin.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

BARGAIN—160 ONLY $5,000. 2 miles good town, Polk County, Wis. Fine hip-roofed barn 34x48, small house, drilled well, all fenced 16-inch woven wire. Rich clay soil, rolling surface, largely cleared, small field. Wonderful sheep and cattle farm. Natural blue grass and clover pasture. Baker, K-110, St. Croix Falls, Wis.

ONLY $1,000 DOWN TAKES 40—2 miles station, on creek, near large lakes. Good frame house 18x28, 16x18; barn, other buildings; 30 acres field or meadow with nice surface and clay loam soil. Bargain at $3,000 for quick deal. Baker I-110, St. Croix Falls, Wis.

WISCONSIN—65 farms, 15,000 acres, wild land. Corn, dairy, clover belt. Counties: Barron, Polk. Easy terms. Lowest prices. List free. L. Rivard, Turtle Lake, Wis.

IMPROVED FARMS, best of location, priced reasonable, easy terms. W. F. Ryan, New Richmond, Wis.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. James, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

POULTRY AND PET STOCK.

BABY chicks from standard-bred, Single Comb White and Brown Leghorns $10 per 100, $90 per 1,000. Bred to lay large white eggs. Safe arrival guaranteed. Catalog free. Wolverine Hatchery, Box 2221, Zeeland, Mich.

FULLBLOOD Scotch Collie pups for sale at farmers' prices. J. V. Northrup, Waupun, Wis.

PURE-BRED WHITE ROCKS. Address "Kremers," Whitehall, Wisconsin.

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get over $2 for wheat and raise 20 to 45 bushels to the acre he **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. There is now an unusual demand for farm laborers to replace the many young men who have volunteered for service in the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

GEORGE A HALL,
123 Second St., Milwaukee, Wis.

Our Farm Help Column.

The following new applications for farm help and farm jobs have come to The Wisconsin Farmer since the last issue:

FARM JOBS WANTED.

Albert Barton, 1250 West Madison St., Chicago, Ill. Age 30. Experienced.

FARM HELP WANTED.

Charles Friday, Gotham, Wis. Wants single man, milking and general farm work. Wages $35 per month.

E. W. Carr, St. Lawrence, S. D. Married man wanted for general work and care of pure-bred Short-horns.

In And Around Wisconsin.

Several local branches of the American Society of Equity in the vicinity of Boyceville, Dunn county, are planning to build a warehouse at that town. The farmers realize that this would be an important step toward improving marketing conditions and already considerable stock has been subscribed for the project.

The Wisconsin College of Agriculture, at the advice of the State Council of Defense, has issued a circular advising farmers to plant buckwheat this year. The suggestion is made that buckwheat grows satisfactorily on land where corn has failed to grow, on wet land which has just been drained, on newly cleared land and on sandy places of the farm. This crop can be planted late in the season, and, for this reason, can fill in where other crops have failed, and the demand for it this year promises to absorb all that is produced. It is an effective weed killer and also a good nurse crop.

A condensery with a capacity of 100,000 pounds of milk daily is being put in by the Van Camp people at Sawyer, Door county. It is reported that the Van Camp Company has been requested by the government to put all of its plants in condition to have a maximum output in 1917. It was the original intention to use the plant at Sawyer for canning peas and other small vegetables, but later it was decided to make a condensery of it. Three-ton trucks will be used in gathering the milk. Most of the condensed milk will be furnished the United States army.

Farmers in Wisconsin who are short of help may obtain assistance in securing someone to work for them by writing to the State Council of Defense at Madison. P. L. Prentice, of the United States Department of Labor, has been in Madison recently conferring with state officials with regard to the labor problem and arrangements were made to establish an agricultural employment zone covering the entire state. Under this plan the State Council of Defense will be in touch with the Chicago office of the federal department of labor and can put Wisconsin farmers in touch with applications on file there.

Drainage work on the Troy marsh in Walworth county will be started this summer. The contract for the work amounts to $50,590 and will include laying more than 20,000 feet of tile in addition to extensive dredging. At present eight capstans utilizing horse power are available for dredging, but a tractor is now being constructed for this purpose. The Troy project is one of a number of drainage plans that will be carried out in Wisconsin this season in order to increase the acreage of agricultural land. Farmers are realizing that the cost of tiling and ditching is not exorbitant and the urgent demand for foodstuffs together with high prices is influencing them to drain their wet land and put it under cultivation.

Patriotic meetings in various towns of Walworth county have aroused both the city and country people to the need for an increase in food production this year and a gratifying response has resulted. Committees are striving to get every available space planted to some useful crop and already an increase in the total acreage is evident. An increase in the number of gardens is also noticeable. The labor question was recognized as a big problem and a labor committee, with L. W. Swan, of Elkhorn, as chairman, was organized to handle this problem. This body is now at work listing the names of those who may be depended upon to do farm work during the busy season. Several tractors were brought into the vicinity of Sharon by Libby, McNeill & Libby, and men and boys are plowing for corn with them. The committee in charge has more than 600 acres on its list, which are to be plowed at a charge of $1.50 an acre. Small grains have been put in in fine shape and every effort is being made to get the corn planted on time. With such enthusiasm and activity there need be little doubt that the people of Walworth county will have plenty for themselves and some to spare when the harvest is at hand.

Liberty Loan

What it Will Mean to the Farmers of America

TO YOU—the farmers of America the Liberty Loan means: a Bigger Market for Your Crops—and Opportunity to Make the Best Financial and Patriotic Investment.

The great $2,000,000,000 Liberty Loan is being made to our Allies in order that they may purchase the products and materials of our farms. Not a dollar of it will leave this country or pay for other than American products. It will come back to us in payment for our labor and materials. It will broaden the market for our goods, increase the demand for what we have to sell, and speed up production by making us raise bigger crops.

The Liberty Loan will make the United States the chief creditor of our Allies and will bind them to making favorable trade relations for the sale of our farm products more effectually than could any treaty.

The Liberty Loan will keep supply and demand moving, and will prevent the depression which sometimes comes with war. It means increased activity in every line where farm products are needed. Europe can use all the American farm products she can get. The Liberty Loan will make it possible for her to get them.

THE BEST INVESTMENT.

Liberty Loan Bonds may be purchased in multiples of $50. They bear 3½ per cent interest, payable semi-annually December 15th and June 15th. They mature in 30 years and are redeemable in 15 years. They are exempt from all taxes except estate and inheritance, so that they give an absolutely net income of 3½ per cent.

Furthermore if, before the end of the war, the Government issues any bonds bearing a higher rate of interest, you can exchange your Liberty Bonds for these higher rate bonds.

Liberty Loan Bonds are signed promises to pay from the richest nation in the world. They are backed by the total wealth of this country—wealth estimated at $250,000,000,000 or 125 times the present loan.

AS GOOD AS CASH WITHOUT THE RISK.

When you need money before your crop is marketed, you can get a loan from your banker, using these bonds as security. They are the best collateral in the world.

No investment can be safer and no other bonds enjoy such a broad and ready market in case you wish to sell. Every issue of Government Bonds this country has ever made have at some time sold at a profit.

The last great Government Bond Issue was sold for par in 1898 and for 110¾ in 1900.

THE BEST PATRIOTIC INVESTMENT.

The Liberty Loan makes it possible for America to strike the winning blows for the liberty of the world—the protection of trade and the safety of American commerce. Secretary of the Treasury McAdoo says to the farmers of America today: "The greatest immediate service the American people can render in this war for universal liberty throughout the world is to furnish the means for its vigorous prosecution. The Liberty Bond issue is the first step. I earnestly bespeak the co-operation of every citizen throughout the length and breadth of the land in this great service of patriotism."

Be a government bond holder. The four payment dates make it possible for you to wait until nearly harvest time before making your final payment on your bonds. Subscribe to the Liberty Loan through any bank or post office today.

Kalamazoo
ALFALFA & ENSILAGE CUTTERS

Before you buy an ensilage cutter, find out all about the *Kalamazoo*—the *only* cutter on the market having a center shear. The Kalamazoo has an unbreakable malleable knife *wheel*—not a knife cylinder. Two knives are constantly cutting toward *center*—absolutely no side-thrust. No wasted power. This center-cutting knife wheel delivers a steady, even flow of ensilage to the blower—clogging is absolutely impossible. Another big feature—

The Knife Wheel is the Blower Fan

You can't realize what a power saving this means until you see a Kalamazoo in operation. All wearing parts are easily adjustable. Cutting adjustment is on shear bar only. This makes adjustment of knives simple and easy compared with other cutters.

Get a Kalamazoo—save power—save cutting cost—feed your herd on less acreage. "Do your bit" by helping prod[illegible] biggest saleable c[illegible]

Don't Buy Any Separator Until You Get Galloway's Patriotic Price!

Stop where you are if you are about to buy a Separator. Let Galloway prove absolutely that you don't have to pay double prices for separators. Farm implement prices are going up and up—but if you act at once you can save big money on my new sanitary model—the separator that holds the world's records for close skimming. My big free book gives separator facts and figures. Write for it today.

Compare it! Test it! Try it! 90 Days

Yes sir—right on your own farm—90 days—180 milkings you can try my new Sanitary Separator. Try it side by side with any other high grade separator you want. The more severe you make this comparison test the more sure I am that you'll keep my new Sanitary model. If you don't, ship it right back at my expense.

I'm still on the job — Dividing the Melon!

I am where I have always been—saving money for my farmer friends with better implements and better values than ever before. I have demonstrated time and time again that dealing direct with Galloway means money in your pocket when you buy a Separator, Engine, Tractor, Spreader or any Implement. Thousands of farmers profit by my policy. Advantageous shipping points save you freight too.

Get my Book—See the big money I save You! Don't decide on any separator until you get my free book and learn the inside secrets of the separator business. E. F. Louthan of Carthage, Mo., says: "I saved $25 and would not exchange it for any high priced separator." Send today for this big money saving book—a postal will do.

WM. GALLOWAY, President
WM. GALLOWAY CO., 33 Galloway Station, WATERLOO, IOWA

DAIRY

A Sheboygan County Success.

FEW FARMERS, if any, make money in spite of themselves. They make money because they understand their business. They must know their business before they can expect profits. Years of experience in the school of hard work and long hours form the basis of most of the advancement made in the farming business.

EAGLE RIGTJE QUEEN.
29.17 pounds. At three years old, 27.22 pounds.

EAGLE RIGTJE PEARL.
Records, 22.67 at two years; 26.22 at three years, and 29.27 at four years.

From grades to pure breds is the big step in developing a dairy and breeding establishment. Before this step is reached every man wants to be convinced that results will justify it. If there were no money value in pure breds and the average production of pure breds were less than grade cows there would be little use in larger investments being made in dairy cattle.

GROUP OF SEVEN SISTERS, AVERAGE 30.5 POUNDS OF BUTTER IN SEVEN DAYS, ON TRUTTSCHEL FARM, SHEBOYGAN COUNTY, WIS.

The Truttschel herd, a few miles out of Sheboygan Falls, run by two brothers, Ed and Otis, was founded on this principle by Mr. Charles Truttschel, Sr., about ten years ago. He had been farming land near Sheboygan Falls in company with his father for a good many years. The Truttschel family were pioneers of the county, coming there in 1850. From the very first dairying was followed, but, of course, on the old system. The cow was a cow when she gave a pail full and when she didn't—well, she wasn't a good cow. That continued for a good many years until the news of better dairy cattle reached into Wisconsin.

EAGLE RIGTJE YESLSTINE.
Senior four year old, 29.50 pounds; senior three year old, 25.93.

EAGLE RIGTJE BEAUTY.
Aged cow with record of 28.11 pounds butter fat.

So the herd was improved very slowly at first, mostly by guesswork and gauging the cow's worth by looking at the amount of milk in the pail after each milking. Then followed the pure-bred bull, a Holstein, whose daughters showed wonderful improvement over the ordinary milk cows of the neighborhood. It didn't take long and a few pure-bred cows were added to the herd. From these three cows came the stock which in time replaced the grade cows and from their offspring again came other stock with ever better records.

But it has only been four years since testing has been going on at the Truttschel farm. The mere word "pure bred" formerly stood for high production and profit, while today every cow is under suspicion until she has proved herself otherwise. When the first tests were made by the brothers not every cow in the herd was a wonder and not every cow had been judged correctly. Some were high in amount of butter fat and some were low. There was no speculation about it. The Babcock test rated them all according to their qualifications. The brothers used this information wisely and have some excellent results to show for each year since the testing work was begun.

During the last season nine cows were tested that averaged over twenty-nine pounds of butter in seven days, fifteen cows averaged 26.9 pounds of butter in seven days with many individuals going better than thirty-three pounds of butter for a week.

The boys have the conservative way that was characteristic of their father. Even now, though the pure-bred work has shown excellent results, they are not plunging into the breeding game. There are only about twenty-five cows on the place, twenty of which are milking. All increase is gradual and well planned. When an animal is added to the herd by purchase it must be an individual that will strengthen the blood now in the herd.

The sire that has shown his worth

in the biggest way is Sir Rigtje of Pinehurst. Seven cows sired by him have produced excellent records, among which are three full sisters out of Besse WaWa De Kol that had a record of 26.93 pounds of butter in seven days. These seven cows averaged 30.5 pounds of butter in seven days. But Sir Rigtje of Pinehurst had the backing of a high-producing dam. His mother was Rigtje Piebe De Kol, that made 918 pounds of butter in a year out of 23,000 pounds of milk.

The present herd sire is Count Piebe out of Pinehurst Piebe, with a nice record of 34.43 pounds of butter in seven days. He traces back to King Segis, one of the premier bulls of the Holsteins.

Ordinary farm conditions prevail and the boys are not wasting any extra feed in order to coax an additional pound of milk from a cow. Silage plays an important part in the ration and is fed the year around. Grain is

EAGLE RIGTJE BELLE.
Aged cows, 32.40 pounds. Produced 128 pounds in thirty days, twenty-eight pounds at four years old and twenty-five pounds at three years of age.

fed at the rate of about one pound to three and one-half pounds of milk per day. The ration is made up of corn, oats and bran. Good clover hay forms the roughage in winter.

The farm contains 160 acres, planted to a rotation of corn, oats and clover, with a little barley occasionally used for a nurse crop. About fifteen acres of the farm are in timber, which affords some pasturage to help out the twenty acres of native sod available for grazing during the summer. About forty acres of clover and fifty acres of oats with the balance in corn make up the total acreage.

The milk is sold on the pound basis to the local cheese factory.

What "Weeding Out" Has Done.

To the Editor:—It is generally agreed that the present high prices are going to do good for the dairyman. If he expects to show profits it will be necessary for him to do at least two things, namely, (1) weed out inferior cows by joining a cow-testing association; (2) use better sires. To keep a herd whose records are not known is fundamentally wrong and such a herd cannot be expected to return the greatest profits. What can be accomplished by "weeding out" inferior cows is plainly apparent in the herd at the Milwaukee County School of Agriculture. This is a Holstein herd and the following table will show their production:

Total number of animals in herd	54
Total number milk cows	36
Average milk production per cow, pounds	9,018
Average butter fat production per cow, pounds	303
Average per cent test	3.36
Income for dairy product in 1916	$6,099.06

These figures are all the more striking when it is known that students do a great deal of the work in the barn. Students always feel free to help in the barn and many of the boys learn to milk at the school. The herd is maintained on a practical basis. As a matter of fact, farm conditions are as nearly represented as is thought advisable for the students. The following figures may be of further interest:

Income of dairy products 1916		$6,099.06
Expenses for feed 1916:		
Grain	$1,186.33	
Hay at $18	1,080.00	
Silage at $4	720.00	
Pasture at $7 per A.	175.00	
Labor	1,055.63	
Supplies, milk cans, pails, etc.	469.10	
Laundry	9.30	$4,695.36
Profit		$1,403.70

Our next ideal (and every man has to have an ideal in herd improvement) is 10,000 pounds of milk and 350 pounds of butter fat. E. L. Liddle.

Milwaukee Co. School of Agriculture.

Artichokes for the Silo.

To the Editor:—You preach in your last issue, "Put Up a Good Silo This Year." Now my neighbors have silos, but have little or no corn to fill them with. One filled his with clover and others had theirs only half full of corn. For who can expect to grow corn in a country which actually in climatic condition is only fit for a polar bear? The silage from clover does not suit me at all. I cannot stand the smell of it. Nor is corn much better. True it is, green fodder keeps up the flow of milk. Has anyone had experience with silage made from Jerusalem artichokes? I find when the artichoke is cut in the fall when green cows eat every bit of it, while corn they leave more than half the stalks. There may not be the same weight as of corn, but there is in addition about sixty to seventy bushels of tubers per acre, which are given a similar feeding value as potatoes. Artichoke stalks are not as easily killed by frost as corn, only how would they be cut for silage?

Farmers object to artichokes because they are called weeds. Well, so are sweet clover, white clover, sour dock, yellow dock, English or broad-leaved plantain. For the latter they pay out every year their hard-earned dollars and raise more and more. I see no earthly use of this. Artichokes I get out, not plantain. I have not found, as yet, a single animal, horse, cow, calf, swine or sheep, on my place that will eat sweet clover, but artichokes they all eat. Only swine refuse the stalks when somewhat old.

I have been thinking of making silage from artichokes, but will it become sour like clover? I have no silo now, but corn is a gamble and I prefer to make hay from clover. I have grown roots for twenty-five years. In 1916 I had my first failure, but I hope to have better luck this year.

Herman Riedel.

MORE CREAM LESS LABOR
Through Using a
NEW DE LAVAL
CREAM SEPARATOR

PATRIOTIC DUTY as well as dollars-and-cents self-interest now demands of every cow owner the saving of every ounce of cream and butter fat.

Likewise the saving of time that is possible through a cream separator of ample capacity, that is easily turned and always in order.

There was never a summer in the history of the country when both these considerations were of as great importance to the nation as well as to the individual producer of cream and butter.

Under present circumstances, a modern De Laval Cream Separator will save its cost every few weeks. Every cow owner owes it to himself and his fellow countrymen to effect this saving.

This is true whether you have no separator or have an inferior or half-worn-out machine, even if it be an old De Laval model.

It is important to remember, too, that if you cannot pay cash for a new De Laval machine, you can buy one on such liberal terms that it will actually pay for itself while you are using it.

Every New De Laval is equipped with a Bell Speed Indicator

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for new catalog or any desired information.

Rice.

High prices are daily making it more urgent for the thrifty housewife to look about for cheaper foodstuffs, and this is where rice comes into its own. Last year not only was the rice crop in the United States larger than ever before but the world crop of rice also was greater than for many years. It may well, therefore, be given an important place in the diet.

While rice has always been considered a good food, it has not been given the important place it deserves. It is not only palatable but very nutritious and easily digested. Boiled rice is digested in one hour. It may be cooked quickly and without waste. It has been used as a breakfast cereal and as a foundation for pancakes, croquettes and desserts, but its importance at this time is due to the fact that it may be used as a vegetable like potatoes and as a substitute for other more expensive foods. In such case, however, especially when it is used as a substitute for potatoes, a liberal supply of fruits and vegetables should be provided, otherwise the body will be robbed of important mineral substances.

In this connection it may be stated that highly polished rice is conceded to be less wholesome and nutritious than the unpolished. The polishing process removes the outer layers of the grain which contain phosphorus pentoxide, which seems to be necessary to make rice wholesome. However, if, as said before, fruits and vegetables are supplied in connection with the rice diet, this difficulty is overcome.

The ways in which rice may be used are numerous. It may be boiled in salted water and used like potatoes as a vegetable at a meal at which meat, eggs, beans, gravy or other foods rich in protein are served. It may be used in stews and soups and in combination with cheese, minced meat or poultry, eggs or fish. In combination with dates or raisins it makes a delicious breakfast dish. In fact, the ways in which it can be used are too numerous to mention and the ease with which it can be prepared, together with its low price, make it a food worth considering during these times of food shortage and high prices.

Cream Cheese.

To the Editor:—I wonder if any of the readers can tell me how to make cream cheese like we buy in bricks. I know that some people do have good luck making such cheese and I wish they would tell us how they do it. I have read quite a bit about cheese-making, but I thought if I could get the experience of those who have had success it might be easier.

Mrs. L. R.

Rainy-Day Play for Children.

How many times on a rainy day has some busy mother been interrupted with the plea from her restless, active children, "Mother, what can we play?" and how many times has mother wished she knew something new to suggest which would give the busy fingers and brains employment and make the children feel that they are actually doing something worth while.

The projects suggested below will involve more or less "muss" and "trash" from the standpoint of the very tidy housekeeper, but they will keep the children absorbed and busy for hours and will furnish excellent training in coördinating head work and hand work. Some small corner, at least, should be given to the child where he may keep his materials and carry on his manufactures. If possible, have a shop in a shed or an empty room where a box of scraps, a hammer and some nails will invite invention without fear of rebuke. When paper cutting or other hand work is done in the family rooms, clearing up afterwards should be made a part of the game and a good workman should be expected to keep an orderly shop wherever it is located.

Paper: 1. Cut out and mount pictures.

2. Cut freehand familiar objects.

3. Illustrate stories with free cuttings and cut out pictures.

4. Make picture books illustrating stories above.

5. Make a house book, grouping pictures of things for one room on one page.

6. Cut out and repeat simple units in form of borders for book covers, playhouses, etc.

7. Cut out families of paper dolls. Make clothes for each doll and color with crayon.

Cardboard: Use empty boxes, ribbon reels, film reels, etc.

1. Make balancing figures to fasten on weighted ribbon reels and pill boxes.

2. Make jumping jacks of cardboard and fasten on wooden frames.

Wood: 1. Make toy furniture from scraps that can be nailed together.

2. Make carts from boxes, using tin can tops for wheels.

3. Saw out animals from thin soft wood with coping saw.

4. Mount animals on trucks, using film reels for wheels.

5. Make three-ply animals which stand alone.

Cloth: 1. Make doll garments of all sorts.

2. Make furnishings for doll beds.

3. Make bags for marbles, bean bags, etc.

4. Make sails for boats and biplanes.

Playhouses: 1. Make playhouses play stores from empty boxes, either wood or heavy paper. For a house, use one box for each room. Arrange the rooms conveniently and cover with cardboard roof. Furnishing the rooms will provide abundant opportunity for work with paper, cloth and wood. By taking enthusiastic interest in what the children do and suggesting frequent improvements, they can be encouraged to make considerable progress in various forms of handwork. Stores may be built on a similar plan, stocking them with either samples of real goods or such imitations as the children can manufacture.

Sand Box: 1. Make representations in the sand box of stories read. Encourage the children to make use of paper, cardboard and other materials in expressing their ideas.—[Agricultural Extension Service, Missouri University.

Refrigeration Without Ice.

Those who are unable to obtain ice during the summer always dread the warm weather when it is hard to keep milk and butter and when left-overs spoil before they can be used. Such persons, if they knew the merits of the homemade iceless refrigerator, would lose no time in constructing one. This can be done with little labor and at a very small cost.

All that is necessary is a wooden frame covered with canton flannel, burlap or heavy duck. If the frame can be screened, so much the better. Evaporation is the principle of this cooler. A pan of water is placed on top of the frame and wicks, made of the same material as the covering, and resting in the pan of water, conduct the water over the sides and ends of the pan, allowing it to seep down the sides of the box. This evaporation will maintain a temperature of 50 degrees in the cooler on hot, dry days.

Make a screened case three and one-half feet high with the other dimensions twelve by fifteen inches. If a solid top is used, simply place the water pan on this. Otherwise fit the pan closely into the opening of the top frame and support it by one-inch cleats fastened to the inside of the frame. Place two movable shelves in the frame, twelve to fifteen inches apart. Use a biscuit pan twelve by fourteen inches on the top to hold the water, and where the refrigerator is to be used indoors have the whole thing standing in a large pan to catch any drip. The pans and case may be painted white, allowed to dry and then enameled. A covering of white canton flannel should be made to fit the frame. Have the smooth side out and button the covering on the frame with buggy or automobile curtain hooks and eyes, arranged so that the door may be opened without unfastening these hooks. This can easily be done by putting one row of hooks on the edge of the door near the latch and the other just opposite the opening with the hem on each side extended far enough to cover the crack at the edge

AN ICELESS REFRIGERATOR WILL MAINTAIN A TEMPERATURE OF 50 DEGREES IN HOT WEATHER.

of the door, so as to keep out the warm outside air and retain the cooled air. This dress or covering will have to be hooked around the top edge also. Two double strips one-half the width of each side should be sewed on the top of each side covering, and allowed to extend over about two and one-half or three inches in the pan of water. The bottom of the covering should extend into the lower pan.

The refrigerator should be placed where it is shady and where there will be a good circulation of air around it. Those who have tried this plan have found it very satisfactory and it involves so little time and money that every farmer's wife who is unable to obtain ice should have one.

Pickles From Brine.

To the Editor:—As I have received many benefits from the Home department I am sending an answer to a request from "Old Subscriber" about how to prepare pickles from brine so they are equal in flavor and brittleness to those you buy.

Put your pickles to be soaked out in a suitable vessel and pour over them boiling water to cover well. Let soak until the water is quite salty. Do this until the pickles are to your taste. I leave mine tasting pretty well of the salt. Then prepare a hot spiced vinegar, using the pure cider vinegar and mixed spices, adding some ground cinnamon tied in a cloth to prevent the discoloration of the pickles. Make up enough to cover the cucumbers well and just before pouring it over them (in a stone jar) add a heaping teaspoonful of alum for each half gallon of vinegar used. One can make the pickles either sweet or sour. We prefer the sweet ones.

These will keep indefinitely—that is, if you can keep them, which I find almost impossible because we all like them so well. Put them in a cool place and they will be ready to eat the second or third day. Mrs. C. E. P.

Recipes.

Fig Cookies.—One cup granulated sugar, one-half cup lard, two-thirds cup figs cut fine, four tablespoons milk, four level teaspoons baking powder, two-thirds level teaspoon nutmeg, one-half level teaspoon salt, one and two-thirds cups flour, one teaspoon lemon extract. Cream the lard and add the sugar and the figs. Add the milk and the dry ingredients (baking powder, nutmeg, salt and flour) sifted together. Add the lemon extract. Form into a soft dough ball and toss on a flour board. Roll out into a sheet one-third inch thick, and cut into two-inch squares. Place a quarter of an inch apart in buttered and floured cooky pans. Bake twelve minutes in a moderate oven.

Hot Weather Pot Roast.—Put four or five pounds pot roast in a pan with salt and pepper to taste. Sprinkle two tablespoons flour over meat and rub in. Add as many carrots and onions and potatoes as needed for dinner, fill pan three-fourths full of water and bake in slow oven two and one-half hours. This is a good Sunday dinner, as one can put all the dinner in oven and it will be cooked when you get out of church, even to having the gravy made ready to serve.

Vinegar Pie.—Two tablespoonfuls flour, one-half cupful sugar, one-fourth cupful vinegar (unless too sour); mix, add boiling water until you have enough for one pint. After it boils down thick as good thick cream add a little butter. Pour in unbaked crust and grate nutmeg over top. Do not bake too long or it will be watery. Frost the top if desired.—G. B.

THE YOUNG FOLKS.

Happy Hollow Farm.

Dear Young Folks:—I have never written to you before, but I have read your letters and like them fine. I am a girl fourteen years of age. I have hazel eyes and brown curly hair.

I live on a farm of 117 acres near a town. My home is in a hollow, so we call it Happy Hollow Farm, and I do my best to make it happy. My home is near a large forest and East Locust Creek runs through it. My sister and I have fine times gathering wild flowers in the woods. We go swimming in the creek. I like the country, and I would not give my country home for a city one.

I help with the farm work and help my mother cook. I have five pets, a dog, cat, pig, hen and rooster. I call the dog, Dutch; the cat, Sir Robert; the pig, Grunt; the hen, Pet, and the rooster, Dick. I love them all.

I go to school and am in the eighth grade. I am going to try to pass this year. I would like to go to high school. I dearly love music and I can play the organ and sing. My father owns a car and my sister and I take many long rides in it. She knows how to run it. I like horseback riding, too. —Alta.

Topsy.

Dear Young Folks:—I have written a story for you and here it is.

"Ouch! Stop that!"

It was little Dorothy Graham who said this. Topsy, her cat, whose spirit was easily aroused, was sticking her very sharp claws into her little mistress' arm.

Dorothy had been playing with her cat that day because it was raining outside and she had to stay indoors. When Dorothy was not looking the cat had run at her doll and had been scratching and pawing in its hair, which made Dorothy very mad because she loved her doll very much. So she had run and caught Topsy and started to whip her. That was when Topsy had dug her claws into her arm.

When Mrs. Graham, who was out in the dining room, heard this cry she turned and ran into the room where Dorothy was and when she got there what did she find but her little daughter in tears and Topsy sitting over in the corner with a queer look in her eyes.

Mrs. Graham had just picked Dorothy up and was going after Topsy when a man came and stood in the doorway. It was Dorothy's father, who was coming home to dinner, and had come in to see what was the matter. So that put an end to Dorothy's troubles and they all went to dinner. —Lois.

A School Picnic.

Dear Young Folks:—Our school was out last Friday, and we had a fine time. They had a picnic for the scholars, and we had ice cream at noon. Then about three o'clock we had an orange hunt. I passed the third grade this year.

I am nine years old. I have two sisters and two brothers. I know the answer to Pauline's riddle: What is it that stands on one leg and carries its heart in its head? The answer is a cabbage. —Mildred.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1784—A neat blouse dress for mother's girl. Pattern is cut in 4 sizes: 6, 8, 10 and 12 years. It requires 3¼ yards of 44-inch material for a 10-year size.

Waist 1893-Skirt 1892—A practical business costume. The waist pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 2⅜ yards of 36-inch material for the waist, and 3¾ yards for the skirt in a medium size. Two separate patterns, 10 cents for each pattern.

2122—Ladies' one-piece dress. The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 8 yards of 36-inch material for a 36-inch size.

1407—A dainty frock for mother's girl. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. It requires 3½ yards of 36-inch material for a 10 year size, for the dress and ¾ yard for the bolero.

2120—A simple model for home or porch wear. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6½ yards of 36-inch material for a 36-inch size.

1615—Ladies' camisole in kimono style. Pattern is cut in 3 sizes: Small, medium and large. It requires 1¼ yards of 36-inch material for a medium size.

Blouse 1647-Skirt 1646—A good sport suit. The blouse and skirt are both cut in 4 sizes: 14, 16, 18 and 20 years. It requires 3½ yards for the skirt and 2½ yards for the blouse of material 44 inches wide, for a 16-year size. Two separate patterns, 10 cents for each pattern.

2102—A comfortable dress for mother's girl. The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 3 yards of 44-inch material for a 6-year size.

1672—Children's rompers, with sleeve in either of two lengths. The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. Size 6 years requires 2⅞ yards of 36-inch material.

2100—Ladies' combination garment of corset cover and drawers. The pattern is cut in 7 sizes; 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3⅞ yards of 36-inch material for a 36-inch size.

2121—A pretty dress for the school girl. The pattern is cut in 3 sizes: 12, 14 and 16 years. Size 14 will require 5⅛ yards of 32-inch material.

1715—Ladies' apron with or without sleeve in either of two lengths and with collar or with neck edge in square outline. Pattern is cut in 3 sizes: Small, medium and large. It requires 6¾ yards of 36-inch material for a medium size with sleeves; without sleeves, 6 yards.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for June 10, 1917.

Jesus Crucified.

LESSON TEXT—John 19:16-22, 25-30.
GOLDEN TEXT—Christ died for our sins.—I Cor. 15:3.

We are compelled to omit a consideration of that dark, despicable trial in Pilate's judgment hall. Pilate's weak-kneed subservience to custom and the cry of the politician is one of the blackest pages in history. His scourging of the man whom he, himself, declared innocent, is practically without parallel. After the mocking and the scourging, Pilate said unto the people, "Behold the man" (v. 5), and later in sarcasm he said to the same people, "Behold your king" (v. 14). Teachers should emphasize at the beginning and all through this lesson that Jesus suffered and died for the sins of all men, ours as well as those of his own day.

I. The Crucifixion of Jesus (vv. 16-22). It was about nine o'clock in the morning when Pilate gave his infamous order that Jesus should be crucified. It was indeed a sorrowful procession which moved itself along the "Via Dolorosa" (the Sorrowful Way), consisting of the Roman soldiers, the tottering, physically exhausted man of Galilee, and, Luke adds, "sorrowing women." They took him to the place of a skull, a hill about sixty feet high, at the foot of which was the rock-hewn sepulcher in which his body was later laid. The place was called in Hebrew "Golgotha," the Aramaic for skull. Calvary is the Latin for the same. On either side of him were crucified the robbers, which was an evident effort to add to his shame as well as a salutary warning to the Passover pilgrims. Over the cross Pilate wrote a title on a wooden tablet. Following the usual custom, this was nailed at the head of Jesus, setting forth his crime. The words it bore were, "Jesus of Nazareth, King of the Jews," as though Pilate would take malicious revenge upon the mob which had made him perform a deed he had sought to avoid. Literally this sign meant, "This man is the kingliest of all Jews, and see what they have done to him." In response to Pilate's questioning, Jesus said, "I am the King of the Jews." Pilate knew that he was innocent, and sought to let him go free, but, rather than incur the hatred of the Jewish authorities, he yielded to their demand for his blood, and became a party to the murder of the Son of God. Men today take a part in his crucifixion rather than surrender wholly to him, and pay the price of open confession. "They crucified him." How these words laid the pride of men in the dust. Human nature is the same today as it was 2,000 years ago when the world's bitterest hate was wreaked not upon a bad man, but upon the best man, the perfect man, the God-man. The pain Jesus suffered on Calvary was no imagination. He suffered it all for us (Isa. 53:6), but the physical suffering was not the most severe agony he bore (Ps. 69:20; Matt. 27:46). The crucifixion of Jesus was part of the eternal purposes of God's love and redemption.

II. The World's Darkest Hour (vv. 23-30). Each of the Gospel writers refers to the part the soldiers took in casting lots for his garments. They were unconsciously fulfilling the phophecy of Psalm 22:18, and it was from their number that one of the supreme testimonies to the character of Christ came (see Matt. 27:54). The first three evangelists tell us of the throng of pilgrims who passed along the highway from the north, close at hand, and who wagged their heads in imitation and mockery of the agony of the one who was being crucified. But there were others who were spectators of this event, a group of Christ lovers (v. 25).

"It is finished." These are remarkable words. He had finished his suffering; he had finished that for which he came into the world when he began his ministry; he had finished the mission for which his father had sent him into the world; he had finished and fulfilled the prophecies concerning his suffering and death; he had completed the work of the redemption; the atonement was finished, and Satan's power was finished; the Mosaic law was finished as far as its claims upon the believer were concerned (Rom. 10:4; Col. 2:13; Eph. 2:15 and 16). Outwardly it seemed to be Satan's supreme hour. It was the world's darkest hour.

The seven last words. These would

Better Workmanship In Foot-Schulze Footwear

Not alone a question of skill—working conditions also govern the quality of the workmanship to a remarkable degree.

Our workmen apply their splendid skill to the manufacture of Foot-Schulze Footwear under ideal conditions in the most convenient, most comfortable, best lighted new factory experience could devise. Is it any wonder Foot-Schulze Footwear cannot be surpassed in quality of workmanship?

Better workmanship means better fitting, more comfort, longer life, greater satisfaction.

Foot-Schulze Styles are conservative, yet include those smart features so pleasing to well dressed people.

See the Foot-Schulze dealer in your town. He's easy to find, and a good man to know.

Foot-Schulze & Company

Saint Paul

Mueller Pipeless Furnace

A real furnace. Heats whole house comfortably, dependably, cleanly and economically *from one register.* Exactly same construction as the old reliable *Mueller* line, but without pipes or flues. Ideal for old or new homes and buildings with small or partial cellars. Saves 35% in fuel. Burns hard or soft coal, coke or wood.

Made of solid cast iron, has triple jacket, substantial firepot and radiator, best type grate. Designed right, built right. 60 years of experience and the *Mueller Guarantee* behind it.

Tear out this ad, write your name and address on margin and mail to us for valuable free book on pipeless heating, and name of nearest Mueller dealer.

be an interesting study for any class. (1) "Father forgive them for they know not what they do;" (2) "Today thou shalt be with me in Paradise." (3) "Woman, behold thy son;" (4) "My God, my God, why hast thou forsaken me?" (5) "I thirst;" (6) "It is finished;" (7) "Father into thy hands I commit my spirit." Christ had power to lay down his life. He had power to take it up again, but he laid it down submitting to a burial in the tomb. At that moment note the effect upon the malefactor, upon the centurion, upon the elements of cloud and sky, upon the veil of the temple, upon the people and upon his friends. What is the effect of this story upon yourself, teachers, and upon those who are listening to your instruction?

UPPER WISCONSIN

Build a Silo Now.

To the Editor:—Save summer succulence for winter feeding. It will pay and it will be patriotic.

You will then provide your stock with a feed that has been preserved with its natural juices as distinguished from feeds that are dried out and stored away as hay or fodder. Because of its juicy character, ensilage is a much better feed than dry fodder, no matter how well this fodder has been cured.

My experience leads me to believe that there is the same difference between good ensilage and dry fodder made from the same crop that there is between grass and the hay made from this grass. Where any of our principal roughages are fed or preserved green at the period of their growth when they contain the largest amount of digestible nutrients, they supply the cheapest feed for milk or meat production that we know anything about.

Dried out and fed as hay or dry fodder these feeds are less valuable because they are less digestible. While they contain as much nutrition as they do in their green state, the animal's digestive apparatus does not have the capacity to make use of it, hence the reason why concentrates must be fed in such liberal quantities to make milk or meat on dry feeds.

Corn is the crop from which, as yet, most of the silage is made, though farmers are beginning to utilize other crops for this purpose. Clover has been found to make very excellent silage and peavine from our pea canning institutions are all made up into this feed. At Antigo this peavine silage has been sold to farmers for $2 per ton and the hundreds of tons that had been ensilaged one year were all sold out by the 1st of February. My own opinion is that any feed that will make hay or fodder will also make ensilage, though the value of the ensilage will vary with the different crops of which it is made.

Since corn is yet the principal ensilage crop, I will state my opinion of the way it should be grown in northern Wisconsin for best results.

The tendency of corn in the cooler climates is to become flinty and the flintier it is, as a whole, the more protein the plant contains; therefore, a variety of flint corn should be selected, the largest that will mature in the locality where it is planted.

As the purpose is to grow the most feed possible on a given area, the corn should be planted about twice as thick as if grown for grain. On the clay loams of northern Wisconsin the seed should not be planted before the 20th of May, and preferably a week or ten days later, to be sure that the growing season has set in. Care should also be taken to plant the seed near the surface, not over one inch in depth, as it will then come up quickly and grow rapidly, all of which is a big help in fighting the weeds later on. So much for the seed; now about the land.

It has been demonstrated that land rich in nitrates will produce a fodder that is comparatively rich in protein.

One investigator states that by heavy manuring and thorough cultivation it is possible to feed 25 per cent more protein into a crop of corn than when grown on poor soil, with insufficient cultivation. Whether this estimate is overdrawn or not, it is nevertheless an important fact, since it points out one more way by which the farmers may produce more of their own protein on the farm and be less dependent on the millers for the important element in their cows' rations.

It must be borne in mind that the climate of northern Wisconsin is cooler and usually more moist than in the south, as a result of which growing plants contain more sap and do not dry out as quickly as they do in a warmer and drier atmosphere. For this reason I have succeeded in making the best and sweetest ensilage by letting the corn get ripe and if not frosted, then to cut it down and let it dry one or two days before filling the silo. My aim is to put the corn into the silo just as dry as it will keep. If the corn is struck by a frost it will then usually dry out enough in a few days to make good silage. Frozen corn should not be allowed to stand out too long, as it damages the leaves to be exposed to the weather when it is in this condition.

While a very large proportion of farmers are beginning to see the good there is in silage, I doubt if very many of them have yet begun to fully appreciate its true value, and for this reason the silos now being built do not have the capacity their owners will wish they had later on.

I would advise every farmer of northern Wisconsin to so plan his silo construction that he will have room for seven tons of silage for each cow he expects to keep on the farm, two and one-half tons for each head of young stock, the same for each horse and about 600 pounds per head for his sheep. This amount will allow fifty to sixty pounds per day for each cow for 200 days, fifteen to twenty pounds each for horses and young cattle, three pounds per head for sheep and there will be silage enough left in the spring to help out the pastures during the summer.

This may seem like heavy feeding of ensilage to cows, but our best cows eat this much every day. They are doing well on it and the only thing that ails them is that twice each day they get hungry for more silage. Our aim is to feed most of our stock all the silage they will eat up clean twice each day. We have not enough ensilage so we can quite do this yet, but we are planning to have more in the near future. It may be urged that it will require too much land to grow the ensilage I advise feeding. To this I reply that the land can be put to no better use whatever than to grow the crops for this feed.

There are two reasons why ensilage is more essential to the north Wisconsin farmer even than it is to farmers who reside farther south. One of these is that while vegetation grows rapidly in that territory, the growing season is comparatively short and in order to have the advantage of green, juicy feed for a longer period and at a reasonable cost silos must be constructed. The other is that the country, being new, a large proportion of the clearings are relatively small. Silos and silage must furnish the means by which these small clearings can be made to carry the most stock per acre and thus, by increasing his income, to greatly assist the farmer in developing his farm.

One mistaken idea that is entertained by many northern Wisconsin farmers is that a silo won't pay them unless they have large clearings. This is a wrong notion. It will pay a farmer in this section to construct a silo as soon as he is in a position to raise ten acres of corn and clover each year. Of course, the first silo would have to be small, but if constructed of concrete it could be used later on for summer feeding, when the larger clearings would warrant the building of a bigger silo.

Both in the building and filling of silos by farmers of limited means the principle of coöperation can be brought to bear to the great advantage of all concerned. One set of silo forms will build any number of concrete silos, and where their cost is distributed among several farmers this expense for each of them will be comparatively small. The same principle holds true in purchasing the silo-filling machinery. Then there is the benefit to be derived from changing work while the silos are being filled.

Ed Nordman,

Chairman Agr. Committee State Council of Defense.

Sheep Raising in Northern Wisconsin.

To the Editor:—I think north Wisconsin is all right for raising sheep, not only on a small scale but on a big scale successfully, providing your land is not too low or too level. Sheep want rolling high land if possible to thrive well. I think nothing pays better than sheep. At present wool is high and so is mutton. In order to raise sheep successfully see that you have the right lay of land to keep and run sheep. And if you have, get a woven wire fence first twenty-six inches and three barb wires on top. Cut-over land, stump land sowed in alsike clover is the best. See that there is plenty of good, clean water, salt and some shade trees for the hot summer months. Keep sheds for winter cool and dry. Feed nothing but alsike clover hay in winter and plenty of salt and water.

If you have a bunch of ewes don't put ram in for breeding until December 10th or 15th. This will give the ewes a chance to run on green grass in early spring so they will have plenty of milk. They will drop lambs from May 5th to May 10th. Don't keep too many sheep in pasture and change pastures every three years. Plow over old pastures, raise every kind of crop on it and sow down with alsike clover. I put twelve pounds of clover to an acre. Cull out all rams and sheep and lambs every fall not good for breeding. Keep only the best and strongest ewes for breeding.

I think to start in, the Wisconsin native sheep picked out are O. K. for a start, but be careful and select the best pure-bred Shropshire ram you can get two to three years old, or an Oxford ram is all right. Keep on breeding up on one kind only. Don't keep ram more than two years for breeding.

I have been in the sheep business on the range for eight years in Wisconsin. Now I am on a 120-acre farm in Taylor county, Wisconsin. We started three years ago with a small bunch to find out how sheep will do. I find that nothing will pay better. I have eighty fine breeding ewes. I got 100 pairs of lambs this spring. We sold the wool for 45 cents per pound. Our Wisconsin native sheep sheared ten pounds per head. Each lamb is worth $10 per head this fall. If you can't keep many try and keep from five to ten head anyway on your farm. Feed oats for one month before lambing time and keep the best clean clover hay for sheep.

E. H. Dehne.

IT'S worth your while to get what good tobacco judges say about W-B CUT, and to notice the way men are changing over to it. Talk it over with some one who chews W-B CUT—there's something sound and fundamental about the tobacco. It's not gummy with syrup; just tobacco through and through—and mighty rich, *sappy* leaf at that—shredded and lightly salted to bring out the good *tobacco* taste.

NEWS OF THE SALE RING

Waukesha Holstein Sale.

The Waukesha County Holstein Sale, May 31st and June 1st was a big success. Prices in most cases far surpassed expectations. The sale came to a total of $35,585. One hundred and fifteen head averaged $309.43. The bulls, including many young calves, averaged $306.30, or coming within $3.13 of the general average. Nine head sold for an average of over $1,000, and two head sold for an average of over $2,000. The most sensational sales were made by D. J. Powell, Waukesha; Fred Pabst, Oconomowoc, and S. A. Baird & Son, Waukesha. Mr. Howell consigned a 24.75-pound two year old, Brookvale Ormsby Korndyke 245245, that is a most promising young cow to which Mr. Geo. Schuster and H. E. & Roy E. Aitken took a particular fancy. The latter, however, after considerable sparring, purchased the cow for $2,150, a price that is said to be the highest ever paid for a Holstin cow at public auction in the state of Wisconsin. Mr. Pabst's 31.68-pound three months old bull calf also went for a splendid figure. Mr. Briggs, of Milwaukee, and Gramling Bros., of Clousman, put up a lively scrap for this animal until he reached the $1,900 mark. He finally went to Mr. Briggs for $1,925. The 27-pound bull calf consigned by S. A. Baird & Son that sold for $1,255, clearly demonstrated the value of combining good breeding, good feeding, good fitting, and good advertising. This calf was given every possible opportunity to put his best foot forward when he entered the ring and the reward was indeed gratifying. A half brother, from a different consignment, by the same sire and out of a 25-pound cow followed the Baird calf and brought $285, nearly $1,000 less. The latter calf, though a good prospect, did not have the opportunity, however, his half brother had been given, which is a partial explanation for the extreme difference in price. Baird Bros.' consignment of two-year-old heifers was one of the choicest that has been presented at any of the spring sales and was certainly a good advertisement for the Waukesha Holstein sales. Too much credit cannot be given Mr. W. L. Baird, secretary of the Waukesha County Holstein Breeders' Association, and one of the firm of Baird Bros., for the success of the sale, as his untiring energy and enthusiasm has been back of it at every turn. The following is a list of sales: Downing Pontiac Butter Man, Oct.

More Emergency Food Experts.

Four more counties will have emergency food agents. These are M. H. Scott, for Manitowoc county; A. C. Oosterhuis, for Sheboygan county; J. L. Tormey, for Iowa county, and A. R. Alberts, for Washburn county.

Mr. Scott came originally from Iowa and is a practical stockman. Mr. Oosterhuis is a native of Wisconsin and a member of the animal husbandry department of the university for several years. Iowa county's food agent, J. L. Tormey, is well known as the secretary of the Wisconsin Shorthorn Breeders' Association. Mr. Alberts has had considerable experience on the branch experiment station farms of the state.

Less than fifteen counties of the state are now without specialists to aid their county defense councils in pushing vigorous food-producing programs.

Sheep Men Are Active.

An effort is being made to recruit Wisconsin's army of sheepmen.

The stockmen of the state through their official organization, the Wisconsin Live Stock Breeders' Association, are coöperating with the college of agriculture and the farmers' institutes in a campaign to aid in popularizing sheep raising.

Buffalo county has been selected as the scene of the first objective. Here from June 12th to 15th farm institutes on sheep production will be held at Mondovi, Durand, Gilmanton, Lincoln, Fountain City and at other places in the Waumandee valley, which, stockmen say, are capable of being turned into shepherds' paradises.

Arthur Broughton, president of the American Shropshire Breeders' Association, with his years of experience and keen insight into the wool and mutton business, will lead the march of the sheep-raising recruits.

A Crib For High-Priced Corn.

(Continued from page 10.)

blocks are eight by eight by eight inches in size. Each has four air cells. Since they are not square cut they will make a smooth outside and inside wall and will at all times keep out the rain and moisture. It is necessary that the walls be smooth and perpendicular or the corn will lodge and bridge across throwing an unusual strain on the walls. Number two and number three corn has been shelled out of these cribs when in the same community other cribs have been a source of nothing but moldy corn. Ventilating cribs are a mighty big problem to solve, but this tile crib seems to fill the bill in a very acceptable manner. Every course of blocks in the wall are reenforced with three one-quarter-inch black unnanealed wires set in the mortar joint. To fight the hungry and troublesome rats a rat-proofing screen covers the inside of the three lower blocks, while a galvanized rat-proofing table projects out four inches. Made of heavy material it will not readily be bent out of shape and if the outer edge is bent downward the horses or other stock will not be injured.

Build the roof right and it will be strong and if properly planned will be easily constructed. A double two by eight plate is bolted to the top of the tile wall, as is shown by the drawings. These bolts can be easily made by any blacksmith. The rafters of two by six are then nailed to the plate and are supported at the center by posts projecting up from the ventilation core walls. At the lower end of the rafters near the outside walls the rafters should not be over three feet apart. When all the rafters have been spiked to the plates pieces are nailed in between at intervals of six feet starting at the lower end and running upward. Then nail on the sheathing so as to run with the rafters. It is a good plan to curve the pieces which were nailed in between the rafters, that is, to make them a little higher in the center. The resulting roof will then be perfectly smooth and will give a very pleasing appearance. One by four sheathing is commonly used with shingles of a tar and asphalt preparation or of steel. At the top of the roof is placed a large cupola or a ventilator of a galvanized metal. This will draw like a chimney up through the ventilating core and the result is that all the moisture is pulled out of king corn that is stored in the surrounding cribs.

Two thousand seven hundred dollars built complete the round 10,000-bushel capacity crib shown on page 10. This includes the building complete with roof, the cup elevator and the gas engine and everything in readiness for operation, ready to receive the corn. The tile were purchased at the rate of $60 per thousand. This particular crib was built for a farmers' coöperative elevator company in Iowa. For the average farm, however, a much smaller crib would be needed. Many of the smaller size have been built on smaller farms with good results. A capacity of about one-quarter this size would fit well on many farms. For $700 or $800 a farmer could build a very satisfactory crib of this type of construction, one that would last a lifetime, fight rats and mold and give him big return for the money spent in the building of the crib.

Fourth of July Packet For You

Count the Dots and Win a Beautiful Prize

You see in the picture, an Automobile covered with dots. Can you count the number of dots on this Auto? If you can do this, we will send you as a prize, *a packet of beautiful Fourth of July post cards*, lithographed in rich colors and also a certificate of entry in our grand contest for a Saxon Automobile. All you have to do is to enclose a two cent stamp in your letter to pay postage and cost of mailing.

SAXON AUTO GIVEN AWAY

Remember the Saxon will absolutely be given away at the close of the grand contest. In case of a tie a Saxon will be given to each person so tied. Send at once so you can be entered in this great contest. Full particulars by return mail. THE AUTO MAN, Dept. 300, Des Moines, Iowa.

A 12 Year Old Boy or Girl can do more and better work with this

Handy Cultivator and Weeder

than three men with common hoes. Price $1.75 by parcel post prepaid. AGENTS WANTED. Ulrich Mfg. Co. 26 River St. Rock Falls, Ill.

SUGAR 4c Per Pound one of our leaders. We save you money on groceries. Write for particulars. COLE-CONRAD CO., Dept. 54, Chicago, Ill.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Jersey Sale at Madison.

THE sales committee of the Wisconsin Jersey Breeders' Promotion Sale to be held at the agricultural college live stock sale pavilion, Madison, Wis., June 14th, has made careful selection of the 70 head of Jerseys to be offered. This committee visited the E. Bruins farm in Fond du Lac county and selected a couple of good heifers in milk, one a very promising daughter of Western King's Chief. At Charles Peterson's farm in the same county, several very nice heifers were chosen, including one a daughter of Harbinger's Chief, very classy and promising stuff. At Lorenz Metzlar's, near New Franklin, a yearling heifer was listed. Metzlar's herd is strong in the blood which made F. H. Scribner's herd famous and Metzlar's present herd sire was secured at Scribner's dispersion sale. The sales committee called at the Weigand Bros. place, near Cleveland, the home of the Hood Farm bull, out of a 1,000-pound cow. This is a great herd in the molding and they are consigning one of their cows with an official record of 602 pounds of fat and two of her daughters, and all three in calf to this famous bull. W. H. Clark's place, at Rice Lake, was visited and two choice heifers chosen. Mr. Clark was not anxious to dispose of these, but did so in the interests of a better offering at the Madison sale. A good consignment of heifers and a young cow were secured at the E. C. Jacobs herd, Elk Mound, a herd well known for its splendid records. Eight entries were selected from the Rollie Vandervoort, E. E. Hill and E. E. Wyatt herds near Tomah. These are splendid herds, all building on official butter fat tests. Ed McGilvra consigns two good cows and their heifer calves about seven months old. A Clover Land bred bull is heading this herd at present. Mr. McGilvra also offers a yearling bull of serviceable age, which is a good one. A good consignment has been secured from the Stubley Ranch at Black Earth. All of these will be well worth bidding on. Consignments are made from the herds of M. C. Vosburg and R. E. Roberts, of Ft. Atkinson, who are using sons of Noble Oak Lands, as is also Wm. Knight, of Eagle, another consignor, the three herds sending up a splendid offering for this sale. The inspection trip of the sales committee wound up at the Howie herd, Elm Grove, and the Fewacres Farm, at Wauwatosa, seven good entries were secured from the latter. Nothing more needs be said concerning these except that they were in their usual bloom. Buyers need have no hesitancy in investing in these Jerseys, as some of the shrewdest men in the dairy business can see great opportunities for profit in the future of this breed. See page 22.—Adv.

W. J. Gillett & Son's Company, Rosendale, Wis.

WHILE visiting this noted herd a few days ago, we had a very pleasant interview with Mr. W. J. Gillett, who has been improving much in health during the past several months. While talking over Holstein problems in general his son, Forest, who had just recently come into the firm, was introduced. Forest Gillett up until about eight months ago was assistant-cashier in one of the banks at Fond du Lac, but realizing that there were greater opportunities for him by taking up the splendid work which his father started many years ago, he decided to cast his lot on the farm with his father and brother, William Gillett, Jr. We were much pleased after looking at the herd to note the splendid records which have been made recently on the first two-year-old daughters to be tested sired by their splendid herd bull, Sir Pietertje Ormsby Mercedes 38th, a 34.59-pound bull, that was bought several years ago from the E. C. Schroeder farm. His daughters not only have splendid conformation, but especially well-placed udders. One of them made 22.66 pounds in seven days and another 19.45 as junior two year olds, which is some indication of what may be expected from the younger animals in the herd sired by this bull. It will also be remembered that this herd broke the state milk record for seven and 30 days last winter with Johanna Darknesss that produced 120.5 her best day, 833.9 in seven days, and 3,118.9 in 30 days. She also made 31.25 pounds butter in seven days and 135.32 pounds butter in 30 days. Another of their herd made 115.9 her best day, and 771.6 in seven days, as well as making 30.46 pounds of butter. Three 30-pound records were made in this herd last winter.—Adv.

William Marshall, Whitewater, Wis.

MR. MARSHALL, who has been breeding registered Holsteins for a number of years, and who has been making some creditable A. R. O. records, has one of the best herds in the vicinity of Whitewater. He now has on hand seven bull calves, six months old out of A. R. O. dams with records of 17 pounds as two year olds, up to 24 pounds as matured cows. Mr. Marshall tested six two year olds last winter that averaged practically 18 pounds. These calves are sired by his present herd bull, King Korndyke Hengerveld Grou, whose dam made 23.46 pounds butter in seven days and 700 pounds of butter in a year on three-quarters. If you are interested in bull calves at this age it will pay you to write Mr. Marshall in regard to the animals described.—Adv.

Harvest Farms' Holsteins, Mayville, Wisconsin.

WHILE visiting Mr. Jerry Riordan, manager of the Harvest Farms, a few days ago, we had an opportunity of looking over the two noted herd sires, Spring Farm King Agatha of Pontiac, and King Agatha of Pontiac Lass. Both of these sires are from the noted Francis M. Jones herd, Clinton, N. Y. Spring Farm King Agatha of Pontiac is a son of King Segis De Kol Korndyke, a son of King Segis and Pontiac Clothilde Korndyke 2d, the first 37-pound cow. His dam is Agatha Pontiac, whose record at four years 9 months is 36.90 pounds butter in seven days. His dam and sire's dam average 39 pounds of butter in seven days. His sire is a son of the best daughter of Pontiac Korndyke, and his dam the best daughter of the best son of Hengerveld De Kol. The junior sire, King Agatha Pontiac Lass, is a son of King Korndyke Pontiac Lass, whose dam, K. P. Pontiac Lass, was the first cow to produce 44 pounds of butter in seven days. Her dam, Tweede De Kol Lass, in turn has a record of 34.39 pounds butter in seven days. The dam of King Agatha of Pontiac Lass is Spring Farm Agatha of Pontiac, which has a record as a junior three year old of 30.67 pounds butter in seven days. Her dam, Agatha of Pontiac, has a record of 36.90 pounds butter as a four year old. The four nearest dams of this bull have an average of 36.53 pounds butter in seven days. Both of these sires are excellent individuals and are siring young stock of most promising conformation. The senior sire has a two year old daughter that just made 18 pounds under ordinary conditions and his junior sire has a number of young calves to his credit that are strictly of the show type. The Harvest Farms also have a very fine Percheron establishment and it will be remembered by those attending the Wisconsin State Fair last year that the Harvest Farms captured 19 blue ribbons out of a possible 22, which may give some idea as to the quality of the animals shown by the Harvest Farms.—Adv.

Mr. Fred Stubley, Black Earth, Wis.

MR. STUBLEY has just written the office saying that he is sold out of females and that he could have sold a hundred more, which is indicative of the great demand for high-class Jersey cattle. Mr. Stubley states that there never was as good a demand as there is at present. However, he has a couple of bargains left in young bulls and those in the market for such animals would do well to get in touch with him. See page 22.—Adv.

Bonnie Mead Farm, Randolph, Wis.

HERE is another convincing argument why it pays to advertise in The Wisconsin Farmer. While visiting this establishment a few days ago we were informed that a transaction had just been completed in which 12 registered Holsteins, including four aged cows and eight yearling heifers, were to be shipped to Herman Telkamp, Fergus Falls, Minn. Mr. Telkamp came to the farm with a copy of The Wisconsin Farmer in his pocket and asked for further information regarding the animals advertised. As a result of this interview these 12 head were sold for an average of $333, which we think is a good average for 12 animals of this age, considering the fact that only four of the yearling heifers were out of A. R. O. dams. These heifers were good individuals however, and were sired by the present herd sire of the Bonnie Mead Farm, which is a full brother to the noted cow, Pietertje Maid Ormsby. Besides having this splendid bull at the head of their herd they have a double cross of the Alcartra, Springbrook Bess Burke family, Van Beers, Canary Mercedes, Sir Johanna De Kol and the Ormsbys represented in the females of their herd. All cows in milk have A. R. O. Records ranging from 17-pound two year olds up to 27.21 pounds as mature records.—Adv.

Excellent Trade in Durocs.

WE HAVE just had a letter from F. R. Constance & Sons, breeders of Duroc Jersey swine and Jersey cattle, Waupaca, Wis., advising that the fall boars he has been advertising are all sold and that he has had a good demand. Another incident where good Durocs are in demand. This firm now offers spring pigs—boars and gilts—that have been well grown and cared for and they guarantee them to please the buyers. This firm is absolutely "on the square," their word is good, and when they write you about a boar or sow you will find the pig just as represented. If not, you are at liberty to return same. Mr. Constance enjoys a nice business and it has been built up by giving value received. We are glad to recommend this herd to prospective Duroc buyers. Notice the advertisement in this issue and when writing for further information, please mention The Wisconsin Farmer.—Adv.

Higgins Has New Blood For Wisconsin.

REALIZING that it was time to get some new blood in Wisconsin, J. W. Higgins, formerly of Gotham, now of Richland Center, Wis., brought some Duroc Jersey sows into the state last winter that are a credit to the breed in this state and to Mr. Higgins as a Duroc breeder. He had some good sows before, but they are what would be termed "cold blooded," so he disposed of these and bought sows of the most fashionable breeding, yet he did not overlook individuality. He has a very fine two year old by the $2,650 Royal King, he by the noted Orion Cherry King. Her dam is by Cherry King 2d, he by Cherry King, the sire of Orion Cherry King. No better pedigree could be written. She had a late fall litter by Valley Chief's Col., he by that great sire and breeding boar, Chief's Col., and out of a daughter of Future Fame by L. E.'s Valley Chief, he by L. E.'s Valley King, the sire of Illustrator. To our knowledge, Mr. Higgins is the only man in the state that has a daughter of the great boar, Cherry Chief, and she has a litter by The Admiral, a litter mate to Valley Chief's Col. There is also a good sow on the farm, sired by a son of Royal King, that has a litter by King Orion. Higgins has a good boar that he is using, sired by Royal King, out of a Top Col. dam. He is a real herd-boar prospect. This breeder has some other sows that are "bred in the purple," but space will not permit us to mention them at this time. Wisconsin Duroc breeders can use some of this good breeding. Get some of it and tone up your herds a little. He has a few that he will sell in June. Write him for more information and note the advertisement in this issue on page 23.—Adv.

Attractive Short-horn Literature.

TWO attractive and interesting little booklets, "The Advantages of the Short-horn" and "The Short-horn as a Beef Maker," have been issued by the American Short-horn Breeders' Association, and will be supplied free in any quantity to those who will write for them. They should have wide distribution. Address American Short-horn Breeders' Association, 13 Dexter Park Avenue, Chicago, Ill.—Adv.

Big Bone Wonder—850 Pounds.

SOME time ago we called attention to the outstanding Poland China boar, Big Bone Wonder, owned by L. P. Martiny, Chippewa Falls, Wis. This was a great boar when we saw him in March and we have just had a letter from Mr. Martiny saying that he now weighs over 850 pounds and he does not think he will have any trouble in making him weigh 1,000 pounds by fall. If he does he will be a hard boar to beat in the aged class, for he has so many good things about him other than size. He is a spring two year old, sired by Perfect Wonder by Big Wonder 2d by Big Wonder, dam, Lady A. by Linkford's Choice. There is a herd in Iowa that has the reputation of having the best sows of any one herd in America, and the best sows in this herd are of Big Wonder breeding. Mr. Martiny is now offering spring pigs sired by Big Bone Wonder—they can be bought cheaper now than they can later when the breeders throughout the state have seen their sire. Guernsey bulls are also for sale. The Guernseys in this herd are strong in Glenwood breeding and are well grown and cared for. The bulls for sale are good ones and will please. Some of them are out of A. R. dams. Write Mr. Martiny relative to the above breeds and please mention The Wisconsin Farmer. See page 23.—Adv.

Chester Whites at Spring Green.

WE HAD another surprise in store for us when we visited Carl Hickcox, at Spring Green, Wis. We knew that Mr. Hickcox bought the top sow in the Burlington Chester White sale, but we found that this was not the only good Chester White on this farm. This breeder has some seven sows that any man might be proud of—big, deep, stretchy matrons, all raising good litters. There are 60 pigs on the farm, most of which came in March and they compare favorably with any we have seen of the breed. The Schiebe sow has a nice litter by Guy's Comet, he by White Prince, out of a Comet dam. The sow is by Eagle Chief, he by the noted White Eagle Chief, and her dam is the well-known show sow, Sister No. 1. Mr. Hickcox will offer his pigs in July, for by that time one can tell more about the pigs and he does not want to ship out any that are not first class. Watch for later announcements.—Adv.

Isaac Higgins Fashionable Durocs.

WITH this issue of The Wisconsin Farmer, Isaac Higgins, Gotham, Wis., starts his advertisement calling attention to his good herd of Durocs. This breeder and J. W. are brothers and they visited several states and herds last winter looking for Duroc Jerseys that would improve their own herds and at the same time furnish some new breeding material for Wisconsin. Both of these men made good buys and have some great sows to show visitors. Mr. Higgins has a choice senior yearling by Big Climax, he by Big Bone Climax, a boar that has a good reputation as a sire in western Iowa. This sow is raising a fine litter by The Admiral, and he is a litter mate to Valley Chief's Col., mentioned in the J. W. Higgins field note. A two year old by the royal grand champion, Royal King, is one of the best in the herd. Her dam is by Cherry King 2d. This sow is a litter mate to the good Royal King sow we mentioned in his brother's herd. She had a fall litter by Gano Model Educator, a boar that combines the blood of Col. Gano, Golden Model 2d and Educator by Ohio Chief. There is a good Defender bred sow on this farm, one of those long, deep, high back kind. She has a fine litter by Chief Advancer, a grandson of Chief Select on the sire's side and a Crimson Wonder bred dam, a boar of great smoothness and quality. Mr. Higgins has a good gilt by S. & H.'s Col., the biggest boar of his age that we saw last summer. He is a grandson of King the Col. This gilt has a litter by Pal's Chief Col., a boar representing the blood of Pal's Col. and Chief's Col. We will have more to say about this herd later, but remember, Isaac Higgins, Gotham, Wis., has the goods, and if you are going to want some of this kind better get your order in early. His advertisement appears on page 23 in this issue.—Adv.

The Dispersion of the Krippner Jerseys.

ON JUNE 15TH a good herd of working Jerseys will be sold at Rice Lake, Barron county, Wis., by L. M. Krippner. This dispersion is not due to the fact that the Jerseys are not money-makers; in fact, 15 cows produced an average of $106 in butter fat and some of these were two-year-old heifers. Mr. Krippner has no children to assist him with his dairy and he cannot get hired help suitable, so he has decided to close out the entire herd of some 30 head. This will consist of 14 matured cows, though none of them old and they are a fine lot with plenty of scale and substance. Most of them are milking now and others will be fresh in a short time. There will also be some bred and open heifers and bull calves. Mr. Krippner showed his herd at the Northern Wisconsin Fair last fall and with four Jersey herds competing he won 13 firsts. The bull now in service is Fenwick's Golden Jolly, a five year old, and 80 per cent of his calves are heifers. His dam is now on test and in eleven months she has produced 415 lbs. fat. The writer saw these cattle a short time ago and those who attend this sale will not be disappointed. They are in good condition, are all tuberculin tested and all of them have been raised on the farm. The blood lines are strong in Golden Lad and Pedro. This sale follows the Jersey Breeders' Association sale at Madison on June 14th, and buyers can leave Madison after that sale and make good connections for Rice Lake. The catalogs are now ready and can be had by writing L. M. Krippner, Rice Lake, Wis. Please mention The Wisconsin Farmer. See page 22.—Adv.

Northern-Grown Durocs.

YOU have heard of northern grown seed corn and northern grown potatoes, and now we have northern grown Durocs. P. P. Schmit & Sons, formerly of Iowa, and now located at New Richmond, Wis., are breeders of Duroc Jerseys and offer through the agricultural press, for the first time, Durocs of their own breeding and raising. Just at this time they have a nice lot of March boars for sale that are sired by Crimson Lad, he by the well-known show boar, Van's Crimson, out of a daughter of the grand champion, Van's Duroc Wonder. Crimson Lad weighed right at 700 pounds last fall as a senior yearling, has a wonderful back and is good from end to end, and is siring a bunch of uniform pigs. The sows are big and have plenty of quality, and, by the way, the boars that are being offered are all out of matured dams. The sows trace back to old Kelly's Pilot Wonder and Hanley, Jr. 1st. The Schmits have 67 pigs from seven sows, so you will get a boar from a large litter. These gentlemen expect to stay in the Duroc business, and the boars they send out are to be their advertisements, so nothing but good ones will leave the farm. At a later date the gilts will be offered, but just now

NEXT WEEK'S SALE PROGRAM

Thursday, June 14 — Jerseys, Wisconsin Jersey Breeders' Association, Chas. A. Peterson, Secretary, Madison, Wis.

Friday, June 15 — Jerseys, L. M. Krippner, Rice Lake, Wis.

the pick of the boars will be shipped. The prices are right and satisfaction is guaranteed. See page 23.—Adv.

Short-horns For Sale.

SHORT-HORN cattle that can be bought are scarce this year. However, we recently found a herd of 80 head, but in view of the fact that the owner had never done any advertising, few knew there was such a large herd in Lafayette county. This herd is owned by G. Stahlnecker, Darlington, Wis., and he has for sale several young bulls that can be bought worth the money. The attraction of the offering is a roan senior yearling sired by the well-known White Rock. This bull was purchased in the Herr Bros. & Reynolds Short-horn sale last fall. Inasmuch as so many of Mr. Stahlnecker's cattle have some Whitehall Sultan blood in them, he cannot use this bull to good advantage, consequently he is for sale. He has plenty of scale, is a good roan in color and is suitable to head a pure-bred herd. Investigate this bull. Besides this fellow he has two other roan bulls, yearlings past, that are nice. At this time he has about 15 bulls, dropped between September, 1916, and January 1st. There are some roans, reds and whites and they have been carried along in nice shape and will please prospective buyers. They are sired by a bull called Scotch Mine, he by the well-known Sultan Mine. It will pay prospective bull buyers to investigate the bulls being offered. Their dams are heavy milkers, and are the big, broad-backed kind. The advertisement appears in this issue. Write for further description and please mention The Wisconsin Farmer. See page 23.—Adv.

Yeksahurst Guernseys.

IF YOU have Guernseys you, of course, know about the Yeksas, and if you haven't some of this breeding your herd is not complete. A. O. Oelson, Livingston, Wis., has a herd of Yeksa bred cows; in fact, he specializes on this line of breeding and calls his farm "Yeksahurst." He has for sale at this time several young bulls of serviceable age from his A. R. cows. They'll please you and if you'll write him he will send you tabulated pedigrees. In writing please mention The Wisconsin Farmer.—Adv.

Great Demand For McDonald Poland Chinas.

J. D. McDONALD, North Bend, Wis., has sold all of his fall pigs but two, having had the greatest demand for his stock he has ever had. In going over his sales we find that he has sold $5,700 worth of Poland Chinas since January 1, 1917. The pure-bred hog business is not so bad if you raise the right kind and let people know what you have. The spring pigs are coming along fine and the early litters are now old enough to ship. Miss Price 4th, the second prize aged sow at Iowa last year, has a nice litter sired by Matchless Wonder, the boar that was second "under six months" at Iowa in 1915. Miss Chief Price, the Minnesota grand champion, farrowed in April and has a nice litter by Crow's Progress. Mack has a great show herd started. His fall boars and his senior and yearling boars are far better than his boars were last year at this time. But then a good breeder should improve each year. Mack's Chief weighs about 900 pounds now and should make a creditable showing again this fall. The spring pigs are fine and there are several boars that look like real herd-boar prospects in the lot. The spring crop is sired by the following boars: Crow's Progress, Matchless Wonder, Mc's Big Bone, Orange Boy (Ike Conrad), Big Orange Equal (E. Story), Smooth Price (J. C. Hendricks) and several others. In all, he has pigs by 13 different boars and of couurse the big noise about the McDonald herd is his wonderful sows. No herd in the state has better or bigger brood sows. The pigs are ready—boars or gilts—and if you want to grow out your own herd boar, get busy at once, don't wait until they are all picked over. Please mention The Wisconsin Farmer. See page 23.—Adv.

Union Stockyards, Chicago, Ill., June 2d.—Curtailment of cattle receipts around the western market circle this week has exerted a tonic influence. There has been a more active demand and prices on all beef and butcher cattle and stocker stuff as well, as the week-end show fully as high a basis as a week ago. Hides and by-products are carrying their share of the load and the market looks statistically strong. Killers are timorous, however, and balk at any prospect of accumulating high-priced beef. All the evidence obtainable from shippers in from the country is that cattle originally intended for summer feeding on grass are being cut loose. Long-fed stuff is being rapidly reduced to relatively few holdings in strong hands, and, as few cattle have been going on feed, a bare spot must develop sooner or later. The country undoubtedly has a big crop of yearlings, but a lot of little cattle have been sacrificed during the past ten weeks and it is doubtful if there will be more than enough to go around. The summer run will be deficient in weight, and that means less beef tonnage than normally.

Hog trade has had a 30@40c reaction on light runs since the bottom of the recent decline was struck last Tuesday, when the market was about 90c lower than May 14th, when the crest of the boom was passed. After corn planting hog prices always slump and the recent break is causing no concern. The market may come back, but even if early May recorded high point for the year the grower is in an enviable position. Few of them have overstayed the good market. The recent break has been facilitated by relaxation of Canadian demand, but the May run was much heavier than expected, and, as spring litters are being weaned a free movement of packing sows at an early date will be logical. Everett C. Brown, president of the Chicago Live Stock Exchange, predicts that low point on hogs for the summer season will develop during the next 30 days, followed by a steady advance until October, an $18 trade on eastern account being possible meanwhile.

Live mutton trade has been undergoing a process of readjustment this week made necessary by the abnormally and unwarrantedly high prices paid the week previous and by the changing character of the offering. The consuming public finally balked at paying the big prices for dressed product that were made necessary by the high cost of the stock on foot and packers suddenly became as bearish as they had been aggressive buyers during the preceding six weeks or more. Since the high time last week matured sheep and lambs have declined $1.50@2 per cwt., while spring lambs have been hit for $2.75@3 declines. It is improbable that killers' bear raid has run its course, yet no one in the trade expects anything other than record summer and fall prices to prevail, many traders being confident that fat lambs of the 1917 vintage will sell above the $15 line all this summer, although there is no precedent for such a market.

Cattle quality this week is the poorest of the season, carrying a lot of low dressing and half-fat stuff dislodged by the feed bill and skepticism concerning the future of the market. Most of it was laid in last fall and shows a profit, consequently owners consider they are displaying good judgment by letting it go. Just how long such cattle will be unloaded is a conundrum. It has been a good market all week for light and handyweight steers and, considering the large proportion of little stuff, yearlings have given a good account of themselves. Wednesday's run carried a jag of yearlings and $11.75@12.50 got many of them. While killers are hungry for such beef, it is not difficult to get a few too many of that kind of cattle on the market any week.

Choice, heavy steers are closing 10c higher than last week. Several loads made $13.70 and $13.60 was practically the limit on that kind late last week. Plain heavy and coarse stuff has been the meanest acting, while fat handyweights are seasonably popular. Eastern beef trade has not been robust, but will soon come back the moment supply lets up. Prices on the bulk of steers show little change for the week, what was taken off early on Monday having been since restored. Yearlings are doing exactly as advertised. They have advanced anywhere from $1 to $1.50 per cwt. since the April low spot and are scheduled for a good market. That they will pay their board bill is a certainty, as it promises to be a great market all summer for yearlings. All that is necessary for the feeder to do is making little cattle decently fat. Nothing handicaps a yearling at the market more than stockery appearance, as the beef cannot be sold to advantage.

Butcher cattle show little change in value from a week ago. Demand has been best for the right good to choice fat classes, which have been active, and if anything, a little higher than late last week, but the trade on canners, cutters and all the lower grade of dairy cows has been weak. A few extra prime heavy beef cows are selling above $11 and tip-top heifer yearlings have sold upward to $12.10, a new record for straight heifers, but $8.25@10 is taking the bulk of the butcher cows of fairish to strictly good fat classes and $8.65@10.60 most of the heifer stuff. Only a few light tail-end heifers sell down to $7.50 and below and $6.75@7.65 is taking most of the canner and cutter cows. Bulls sold stronger to higher the first half of the week, but lost their gains and more subsequently. A spread of from $8.60@10.15 is taking common light bolognas to good butcher bulls, only trashy light canner bulls going below $8 and choice to prime corn-fed beef bulls reaching $10.25@11. Veal calves have had a $1.75@2 decline from last week's top levels, closing the week at $13.25@13.50 for good to choice fair weight vealers and at $12.50@13 for plain to good lights, with throwouts largely at $8.50@9.

Stockers and feeders are steady to stronger than a week ago, but the volume of trade is still narrow. Fair to good stock steers are selling largely at $8.65@9.50, and good to choice feeder yearlings and more aged feeders up to $9.75@10.25. A load of extra choice fleshy feeders, the kind on which killer competition is strongest, sold to an Ohio operator for short feeding purposes at a price well above $11. There is very little trade in such grades and the few odd sales which are made are not a criterion to the general market.

Declines in hog values last week and at the start of this week were instrumental in sharply curtailing the marketing of swine here and elsewhere the last few days and the market has made a good recovery, although packers have fought the advance at every step and at the close yesterday the market still showed a 10@15c loss from a week ago, but a 30@40c advance from the low spot on Tuesday of this week. Receipts at eleven markets the first five days of the week showed a decrease of nearly 175,000 head from like period last week. Best selected butcher hogs sold yesterday at $16.05 with 210 to 260-pound butcher hogs largely at $15.85@15.95 and the bulk of the packing hogs at $15.50@15.75, comparatively few hogs of fair weight going below $15.60, though small lots of rough heavy packers ranged down to $15.25, some common to fair 135 to 150-pound light stuff down to $14.75@15.25 and good to choice pigs from $13.50@14.50.

Although supply of live muttons has been very light again this week, bad dressed trade conditions and packers' determination to work prices down to a more legitimate trading basis, have been the controlling influence in the market, which has declined about as rapidly as it had previously been advancing. The slump came as a logical and seasonal readjustment and apparently it has not yet run its course. The run has carried a dwindling proportion of dry-fed stuff and a larger quota of feed-lot tail-ends and grassy natives. The latter have had the meanest call, though not showing materially more decline than the best fat classes. At week-end most of the aged lambs and matured sheep showed declines of from $1.50@2 and spring lambs a $2.75@3 break from the recent high spot. It is now largely a $14.75@15.25 market for decent to choice shorn lambs, coarse, bucky natives ranging down to $13.50@14 and culls selling downward from $13. Wool lambs have become practically a minus quantity. Fair to choice spring lambs are selling at $16@17.75, with decent to good culls at $12@14. Trade on fat shorn ewes is on an $11.50@12.25 basis, cull ends selling largely at $6@8.50. Shorn wethers of choice class are quotable to $13 and light shorn yearlings to $14.25, but such stuff is practically lacking.

Dairying in Western Wisconsin.

(Continued from page 1.)

on the same day. The annual meeting this year is to be held at Sparta, June 20th, and take on the aspect of a farmers' picnic. Besides the meeting a good time can be had by everyone present and a good program will be arranged. The hope of the men behind the meeting is to have the governor present on that day. Other speakers of prominence will be present. Former meetings were a success because of the excellent talks given by such men as John B. Irwin, George McKerrow, Prof. J. L. Tormey and Dean Russell, of the agricultural college, State Commissioner of Agriculture C. P. Norgord and other prominent speakers.

THE VAN DER SCHAAF FARM HOME MONROE COUNTY, WIS.

CHESTER WHITE SWINE.

PIGS will be shipped at weaning time. Sire, Paddy by Schoolmaster. Get your order in early.
A. L. GRAY Mt. Hope, Wis.

See page 12. Read The Farmers' Market advertisements. There may be a bargain there for you.

Farm Loan Association.

Farmers in the vicinity of Washburn have formed a farm loan association and made application to the Federal Farm Loan Bank at St. Paul, Minn., for a charter and loans amounting to $39,500. There is no doubt that the application will be accepted, since the new organization is well above the minimum requirement both in membership and amount of loan. The law requires a minimum membership of ten farmers and loans amounting to $20,000 before a charter will be granted. When all the farmers who have taken an interest in the Washburn organization have sent in their applications the membership will be about forty and the amount of loans between $50,000 and $60,000. Bayfield county and the western half of Ashland county will be the territory covered by the new organization which will bear the official name of The Washburn National Association. The board of directors are: B. Hirsch, president; L. F. Kinstler, vice president; M. J. Raarup, E. R. Tetezner and J. N. Kinney, directors. Andrew Berge was elected secretary-treasurer. When the organization is complete, members can borrow from $100 to $10,000 on their farms for productive purposes and pay it off in from five to forty years, according to the amortization plan. The interest rate will be about 5 per cent.

Silo filling is being solved in the new counties in the same manner as grain threshing. One man can get an outfit and help his neighbors at silo-filling time. One outfit cannot handle a large number, but the plan works well in neighborhoods where the farm land is not yet sufficiently developed to permit of all modern machinery.

JERSEY DAY IN WISCONSIN

Wisconsin Jersey Breeders' Promotion Sale

will be held in the Agricultural College Live Stock Pavilion.

Madison, Wis., June 14

Sale to commence at 1 p. m.

70 HEAD, selected from 25 of the best herds in the state by competent judges representing the Wisconsin Jersey Breeders' Association. W. G. JAMISON & SONS Appleton, Wisconsin

Registered Guernsey COWS

WE ARE OFFERING

THREE imported and five home-bred cows for sale at reasonable prices. They are bred to our good herd bulls and two are due to freshen soon. Send for description and breeding, or better yet, come and see them. We will also sell our herd bull, **Peerless of Midlothian,** whose dam made 535.15 pounds of fat.

CHESNEY FARMS LAKE VILLA, ILL.
O. W. LEHMANN, Prop. J. GRIMSHAW, Mgr.

2 to 8 Months Old Guernsey Bulls

SIRED by some of the best sires of the breed and mostly out of imported dams.
TAMARACK FARM, DOUSMAN, WIS.
Gustav Pabst, Prop. Fred Southcott, Mgr.

A FEW WELL-BRED YOUNG BULLS — The Harlem Farm — WRITE YOUR WANTS
Emory C. Meitz GUERNSEYS Appleton, Wis.

GUERNSEY BULL FOR SALE

MY herd bull, Glenwood's Noble Secret 23999, four years old, good breeder, right in every way.
E. H. KIESLING Jefferson, Wis.

YEARLING GUERNSEY BULL

READY for service. Sired by **Auriculas King of the May** and out of a granddaughter of **Yoeman,** whose dam has given 10,700 lbs. of milk and 487 lbs. fat in a year. Price right. Send for pedigree.
W. L. Breitick Greenville, Wis.

GUERNSEYS

OF both sexes for sale. Advan ced Registry blood lines. Individuals of merit and well worth investigating. A. H. Hinman, Allenville, Wis.

GALLOWAY CATTLE.

30 GALLOWAY bulls for sale, 14 to 18 months of age, sired by Standard Favorite and Stanley's Othello. Also cows and heifers and Oxford rams for sale. C. S. Hechtner Charlton, Iowa

DUROC JERSEY SWINE.

HERE IT IS

NEW DUROC BLOOD FOR WISCONSIN. Sows by CHERRY CHIEF, ROYAL KING, KING ROYAL, LEE'S DEFENDER. Litters: THE ADMIRAL (by Chief's Col.); Valley Chief's Col. (litter mate to above); KING ORION, CHIEF ADVANCER. A limited number of pigs FOR SALE. Order early.
J. W. HIGGINS - - - - - Richland Center, Wis.

Aristocratic DUROCS

BLOOD LINES of the most fashionable breeding, for the particular hog-man. LOOK—ROYAL KING, BIG CLIMAX, COL. GANO, EDUCATOR, CHIEF'S COL., DEFIANCE and KING THE COL. breeding. Have pigs of this breeding for sale. Start right, get the best. Order early.
ISAAC HIGGINS - - - - - - - Gotham, Wis.

RED OAK DUROCS

FALL PIGS ALL SOLD. Spring pigs for sale, either sex. My DUROCS MUST PLEASE YOU or you return them. At your service.
F. R. CONSTANCE & SONS Waupaca, Wis.

ATWATER

IF INTERESTED in DUROCS, write me.
L. F. ATWATER Bangor, Wis.

NORTHERN GROWN DUROCS

BOARS OF MARCH FARROW by CRIMSON LAD 179333 out of mature sows. Good bone—high backs—easy feeders. We guarantee satisfaction.

Here's The PROOF

$195.00
And a Ford

STAUDE Mak-a-Tractor. Ready to hook on and pull any load that a 4-horse team can handle.

$1000 and Their Harness

This great team has no more pulling power than the STAUDE.

500 Demonstrations Next Saturday!

In practically every state in the Union—in every neighborhood where there is a STAUDE dealer—there will be a field demonstration of the STAUDE Mak-a-Tractor next Saturday and each following Saturday in June!

You must see this demonstration to fully appreciate what this sensational power outfit will do on your own farm.

See the STAUDE Mak-a-Tractor do the work of four big horses. **See** it start on high gear with full load. **See** the STAUDE special cooling radiator and force-feed oiling system that absolutely prevents the engine from overheating. **See** why the STAUDE Mak-a-Tractor has an actual block pulling test equal to eleven times the power of the FORD touring car. **See** for yourself how the STAUDE converts speed into increased pulling power.

See with your own eyes how you can convert your FORD into one of the most efficient tractors ever invented for general farm work. **See** how all pull and strain is placed on the powerful tractor wheels—the FORD is simply pushed forward and does not pull a pound. **See,** finally, how you can replace the tractor drive wheels with the regular FORD rear wheels and start off for town in 20 minutes or less.

And bear this in mind: your FORD will last twice as many years doing farm work with the STAUDE Mak-a-Tractor as it will if driven on the road for the same number of hours per day! Make our demonstrator prove that statement, by showing you that the engine does less work and is better oiled and cooled—and the springs, body and chassis don't get half the strain of road driving because the car moves over the field at such slow speed.

Mail the coupon right now and we will send you a full description and the location of the field demonstration that will be held nearest you next Saturday, as well as each following Saturday during the month of June. Get fully acquainted with the possibilities of the

Will plow 12 to 15 acres in 24 hours without a rest.

Puts the seed in the ground in half the usual time.

Draws the biggest 4-horse binder like a plaything—day and night.

Back on the road again before you could pick up the work team and harness the driver—15 to 20 minutes.

They work 100 days—but they eat 365 days each year.

The oats and hay of one horse will pay the cost of running the STAUDE Mak-a-Tractor.

The STAUDE will travel 5 miles to their 4 miles—and turn the same furrow.

Staude Mak-a-Tractor

This outfit converts any Ford car—roadster or touring car—into a farm tractor that will pull any load that four horses can move. The tremendously strong tractor drive wheels and axle carry the weight of the car and do all of the pulling. There is no weight or pull on the Ford axle or frame.

The Ford rear wheels are replaced by pinions which intermesh with the bull gears of the tractor wheels and transmit the power of the engine to the tractor wheels—giving them 11 times the pulling power of the Ford car.

Any man, boy or woman who can drive a Ford can drive the STAUDE Mak-a-Tractor. It always starts and runs on high gear—no gear shifting from start to finish. Rides easier and steers easier than on the road because of slow speed. Does the work of 4 big horses, anywhere and everywhere, at ¼ the cost. Average cost of plowing with the STAUDE Mak-a-Tractor during 1916 was less than 1½ gallons of gasoline per acre.

See the Demonstration Nearest You!

The war is creating a big shortage of horses, horse feed and farm help. Get ready for a still bigger shortage and "do your bit" to increase food supply for the world. Immediate delivery. **Over 6,000 now working on the farm. We are shipping 150 per day.** Mail coupon today and see that demonstration!

THE WISCONSIN FARMER

VOL. XLVI. NO. 24. THURSDAY, JUNE 14, 1917. WHOLE NO. 1846

NATIONAL HOLSTEIN MEETING.

THE Holstein-Friesian Association of America held its annual meeting June 6th at Worcester, Mass., this year and as is the custom of the event a large and enthusiastic number of breeders throughout the United States were in attendance.

Probably never before in the history of the Holstein business have conditions been more favorable for the future of this great industry than today. Dairying is now recognized as one of the most important branches of agriculture and it is just as essential at this time to increase the production of butter and cheese as it is to increase the production of wheat, corn, oats and other field crops. The Holstein-Friesian Association of America has been a virile organization for many years, aiding and assisting in bringing out the great points in favor of the Holstein cow. The Holstein cow would, of course, have been a great dairy animal if there had never been a Holstein association. But it was necessary to have the association in order that the splendid achievement of this dairy cow become known to the world and in order that the proper spirit of competition for honors might enthuse breeders to accomplish the greatest possible results. The Holstein ow has had the merit and the association has afforded an opportunity for her to distinguish herself before the world as an efficent dairy machine. The work of this organization has been of such a high character as to warrant its careful study by other organizations designed to popularize any particular breed of live stock. One of the chief reasons for the success of the Holstein-Friesian Association of America is that it has always been fortunate in having at its head men of big caliber and wide vision. These men have long since known the possibilities of their favorite cow. That they have come into the realization of some of their ambitions may be seen by the report of sales made at Worcester this year. Not only is the Holstein a great farm cow, a prolific producer of milk, but the prices which were offered at public sale at Worcester for the 143 head sold, entitle the breed to a rank of gentility in the dairy world which fulfills the highest ambitions of those who have striven so energetically to give the black and white cow her "place in the sun."

King Ormsby Jane Rag Apple, sold at Worcester sale for $53,200, the highest price ever paid for an animal. Mr. D. W. Field, Brocton, Mass., buyer, holding calf. Back of calf Oliver Cabana, consignor. Calf at five months weighs 250 pounds. His dam, Ormsby Jane Segis Aaggie, at six years of age holds seventeen world's records, including seven, thirty, sixty, ninety and 100 days' records for butter and milk. At four years her seven-day record was 44.42 pounds and at five, 46.33 pounds—milk, 879 pounds.

The association at present has the good fortune of having at its head a man who has not only proved his ability in this capacity, but a man whose high standards command the admiration and respect of all Holstein breeders throughout this country and whose guiding hand has had a mighty influence toward eliminating that which is questionable from the Holstein business. D. D. Aitkin was, therefore, deserving of the courtesy of being unanimously reëlected president of the National Holstein Association of America.

The only change this year in the officers of the association is in the board of directors. The following are the new members on the board: W. B. Barney, Hampton, Iowa; A. G. Brockway, Syracuse, N. Y., and W. A. Matteson, Utica, N. Y.

At the business session the chief topic of discussion was the subject of tuberculosis, led by F. F. Field. In his discussion he related how they had cleaned up their own herd and enumerated a number of practices that he felt were essential in dealing with the dreaded disease. In the first place, Mr. Field advocates plenty of fresh air and sunshine. He also believes in taking the calf from its mother immediately after being born and treating it as if the dam were known to be a reactor. Milk to be fed the calves is pasteurized by holding it at about 145 degrees for thirty minutes. Pasteurizing by the flash system is not recommended, as it has a tendency to destroy some of the properties of milk which makes calf raising much more difficult than where milk is not heated to so great a temperature and is held for a greater length of time. Cultures are taken from the older animals of the herd frequently to determine their physical condition. After Mr. Field closed his remarks a rather heated discussion followed with reference to the efficacy of the tuberculin test and the laws affecting its use.

In business session, the Holstein-Friesian Association of America voted several appropriations which indicates the broad gauge of the organization. The total sum of $100,000 was appropriated for Liberty Loan Bonds and an additional $1,000 for the Red Cross. Wisconsin people will be interested in the many kind words which were heard during the association meeting concerning ex-Gov. W. D. Hoard. The members were solicitous concerning the health of Wisconsin's former governor, who has rendered conspicuous service to the dairying industry not only in his home state, but in the dairy world at large.

Glen Alex Queen, sold for $18,000. Record at two years, eleven months, twenty days 42.36 pounds of butter in seven days—608.3 pounds of milk. World's champion two year old. Consignor, A. C. Howe, Glen Alex Farm, New Hartford, N. Y. Purchaser, Hollywood Farms, Hollywood, Wash. This cow's dam made a record of 42.26 pounds of butter in seven days at nine years.

It was gratifying to see the increasingly large number of Wisconsin representatives at the meeting. There should have been many more from the Badger state, as the annual meeting and sale held in connection therewith is a great education for any breeder. A great opportunity was offered to rub shoulders with big men who have big ideas and to get a broad and comprehensive view of the possibilities of the dairy business and of the Holstein breed in particular. Every Holstein breeder in Wisconsin should plan to attend at least one of these great national gatherings and if it is possible, it would pay him to be there every year. A great many breeders arranged to take in the national meeting and sale as a part of vacation trip, and many brought their wives along. Sight-seeing trips were planned for the ladies and various social affairs occupied their attention while the weighty matters of the Holstein business were grinding on. In this

(Concluded on page 11.)

FARM MECHANICS

Questions and Answers.

Tire Filler.

Please tell me how to make a solution to put into a bicycle tire to make it a solid tire. How much of this solution will it take to fill a tire 28x1½?

Answer.—You can buy this solution as cheap as you could make it. Ask your auto supply man for "Pneumastic" or some other tire filler.

Tube Vulcanized to Reliner.

Having purchased some reliners for my tires this spring, I note that I have put them in wrong. The reliners vulcanized onto the inner tube. How can I separate them again?

Answer.—We know of no way to separate vulcanized parts if the vulcanizing is well done. You might try dissolving the cement with benzine, but you will probably have but little success.

Battery For Trouble Lamp.

Please tell me how large a storage battery or how many dry cells would be required to light a two-candle-power, six-volt dash trouble light with a tungsten bulb?

Answer.—Use a six-volt, forty-ampere storage battery, or any six-volt storage battery of forty or more ampere hours capacity. Or you can use five dry cells connected in series. A more economical combination would be ten dry cells connected in series-multiple, five in each series. That is, connect five cells together, carbon to zinc; then connect the other five cells together the same way. Then connect the two remaining zinc terminals to one terminal of the light switch, and the two remaining carbon terminals to the other terminal of the lighting switch.

Lighting From Dry Cells.

I installed a spot light and a dash light on my 1917 Ford car. The spot light has a twenty-four-candle-power nitrogen bulb and the dash light a two-candle-power, six-volt bulb. I have these connected to eight dry cells. What size of bulbs would give the best satisfaction? Could I connect the spot light to the magneto? Would it be better to get more dry cells?

Answer.—Your magneto would burn out either of the bulbs mentioned above, as their voltage is too low. It is not economical to operate a twenty-four-candle-power light from dry cells, but it can be done. For operating the two lights with as great a degree of economy as can be expected, use twenty-five dry cells, connecting them five in a series, and the five series in multiple, as explained in the preceding answer. By using resistance in the circuit, you could operate the lights from the magneto, but it would overload the magneto.

Motor Misses at High Speed.

I have a Model 79 Overland car equipped with a Splitdorf magneto with "TSA" transformer and Model R Schebler carburetor. It is nearly always impossible to start the motor on magneto, even when the motor is warm. When the throttle is suddenly opened, the motor will choke. It then seems to fire on only one or two cylinders. Sometimes it will even stop. When the throttle is slowly opened, it picks up all right; but when the car is running at twenty-five miles per hour or faster it seems to miss once in a while, and will also do this when pulling pretty heavy. The car has been run about 5,000 miles, and has good compression. I have cleaned the spark plugs, and have cleaned the carbon out of the cylinders. Would the points on the spark plugs being too wide cause this trouble?

Answer.—Too wide a gap at the spark plug points could cause the trouble. A weak valve spring on an exhaust valve might also be the cause. Sometimes a valve spring will become weak after having been used for some time. The platinum points of the magneto circuit-breaking device may have become worn or burned. They should be dressed with a fine file so that they make good contact. The most common cause for missing at high speed is faulty carburetor adjustment. The following instructions are given by the Schebler Company for adjusting the Model R carburetor:

To adjust the Model R carburetor, turn the air valve cap over the auxiliary air valve to the right until it stops; then turn to the left one complete turn. To start the engine, open the throttle one-eighth to one-fourth way. When motor is started, let it run until the engine is warmed; then turn air valve cap to the left until the engine hits perfectly. Advance the spark three-fourths way on the quadrant; if the engine back fires on quick acceleration, turn the adjustment screw under the auxiliary air valve up, so as to increase the tension on the air-valve spring. Turning the air valve cap to the right enriches the mixture. For best economy and power, we recommend that the slow speed adjustment be made as lean as possible.

In your case, you should start the engine and then gradually screw in the adjusting screw under the air valve until you can speed up rapidly without choking.

A Power Hay Hoist.

Please tell me in the Farm Mechanics Department whether it is practical to make a homemade hoist to put hay in the barn, the hoist to be operated by a gas engine. Please publish a sketch showing how to make it with a reverse. How many horse power would it take?

Answer.—We are publishing a sketch showing how a simple power hoist

may be made, which will answer well for this and similar purposes. B is the hay grapple fork, which should be purchased from your implement dealer. A is a 4x4 oak timber, one end of which is mounted so as to swing in a bracket made from two iron straps bolted to the side of the barn as shown in the figure. The straps should be about four inches wide and three-eighths of an inch thick. A should be long enough to reach from the side of the barn to the center of the hayrack. F is a 4x4 oak block, mounted so as to turn between two strap irons bolted to the side of the barn. The pivot bolts in A and F should be in line. C represents two side braces between A and F, one brace being bolted to each side. Pulleys to support the hoisting rope are suspended by iron straps from A. G is a drum mounted on a jackshaft driven from the engine, H being the driving pulley. The drum may be made of wood if your dealer cannot supply you. To operate the hoist, pull on the free end of the rope. A slight pull increases the grip of the rope on the drum, and the power for pulling up the load is furnished by the shaft. To lower the load, release the rope. There should be a clutch on the engine or a tight-and-loose pulley on the shaft so that the shaft may be stopped whenever desired.

Making a Small Tractor.

I would like to have a little information I would like to make a [illegible] tractor. I have a two and o[illegible] horse-power engine. Could I u[illegible] binder bull wheels for the wheels? Could I use a chain direct from the crank shaft to the drive wheels? How much would it pull? Would it pull two sections of harrow?

Answer.—Your engine is rather small for making a tractor. Unless you are careful to avoid friction, the machine would not much more than pull itself. If very well constructed, it might pull about as much as one horse. You could use binder bull wheels for the drivers, although mower wheels would be better for such a small engine. It is doubtful that you would be able to reduce the speed enough if you run direct from the engine to the drivers. Besides, you would not be able to reverse the machine. You would in any case need a clutch either on the engine shaft or on the jackshaft so that you could stop the machine without stopping the engine.

Drive For a Biplane.

Do you think that a motor making 300 R. P. M. on low and 700 R. P. M. on high would drive a wood propellor on a biplane fast enough to make it rise in the air? By putting a small pulley on the crank shaft of the motor and a pulley three times as large on the propellor shaft, the propellor would make 1,200 to 1,400 R. P. M. The biplane and engine complete weigh about 200 pounds. Would it be best to use a belt or chain drive to run the propellor? How many miles per hour would this machine make in the air? The diameter of the propellor is about eight feet; and it has two blades.

Answer.—An engine for an aeroplane must have a large amount of power for a small amount of weight. This condition can only be met by engines of very high speed. Since the engine mentioned above is a low-speed engine, it would not be very suitable for aeroplane work. If the engine develops thirty horse power or more, it would probably operate the aeroplane. The speed of the machine would depend upon the general design; thirty to forty miles per hour might be expected. The drive between engine and propellor must be positive; never use a belt drive for this purpose, as the belt might slip or break. To speed up the propellor, place the sprocket on the engine sh[illegible] small one on the pr[illegible] the reverse, as [illegible]ated

A quart[illegible] of a [illegible] horses for the army are to be purchased by the war department as soon as the funds authorized by the $5,300,000,000 appropriation bill now pending are available. It is estimated that $50,000,000 [illegible]ded for this purpose. [illegible]partment has all the ma[illegible]dy for gathering this enor[illegible]nber of horses. Agents of the [illegible]artermaster's department are [illegible] the field, and as soon as the [illegible]ident has signed the bill they will [illegible]eed with the buying.

WHAT makes tobacco good is the sap there is in the leaf to start with and the way it's cured—some tobacco is sappier than others. If you take a big chew of W-B CUT, you may find it too rich for you. Take a *little* chew—it's made of fine, sappy, leaf; there's a lot of *tobacco satisfaction* stored away in it. The touch of salt brings it out, without so much chewing; and a *little* chew *lasts* and *satisfies.*

Made by WEYMAN-BRUTON COMPANY, 1107 Broadway, New York City

Free Catalog in colors explains how you can save money on Farm Truck or Road Wagons, also steel or wood wheels to fit any running gear. Send for it today.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

WISCONSIN FARMERS EAGER FOR FEDERAL LOANS.

I AM delighted to be able to report, this week, that the new federal land bank which will serve Wisconsin, Minnesota, North Dakota and Michigan, and which is located at St. Paul, is embarking on its career with every prospect of even greater success than I have been predicting for it. I am advised by Mr. W. S. Harris, one of the directors of the bank, that there are applications on file already for practically $15,000,000, which sum is to be loaned to the farmers of Wisconsin and neighboring states at the low rate of 5 per cent. The aggregate farm-mortgage debt of the four states served by the St. Paul bank (according to the last report of the federal census bureau) is $348,520,213. Thus we see that the new federal land bank is already called upon to handle 5 per cent of the total farm-mortgage indebtedness of these four states in the very opening days of its existence.

There is good reason to believe that the farmers of Wisconsin, Minnesota, North Dakota and Michigan will patronize Uncle Sam's new bank to a far greater extent as the weeks and the months pass. I am indebted to Mr. Harris for giving me some very interesting information in regard to the new bank, as follows:

We sent out, to the country, organization papers for about 450 associations. In addition there were about 193 inquiries from people who had not actually held meetings, but who said that they would hold meetings and organize as soon as we were ready to do business. To these we did not send out a full set of documents—preferring to wait until organization was completed.

The few associations we have heard from average each more than $30,000 of loans. If this average is maintained over the 450 associations which have actually held meetings—and if those associations complete their organization—we will have something like $15,000,000 of loans applied for—within the very near future. Some of our associations are applying for as much as $100,000 of loans.

Mr. B. F. Faast, of Eau Claire, is vice president of this federal bank at St. Paul, which gives us a state interest in its success. I am not informed just what percentage of the applications are from Wisconsin farmers, but I have no doubt but that the percentage is large, for of the $348,520,213 farm-mortgage indebtedness of the four states I have named, $146,815,313, or more than 40 per cent of the total, is here in Wisconsin. Our farmers are learning that it is good business to use their credit for the purpose of adding to their land and stock holdings, improving their farmsteads and buying machinery with which to increase their efficiency. The day has passed when a mortgage was considered a disgrace. The states which lead the nation in agricultural production also lead in the amount of farm indebtedness. The two are closely allied.

I shall continue to keep my readers posted on the working of the new federal farm-loan law from time to time. I have explained practically all its details already, but if any readers of The Wisconsin Farmer are in doubt on any point, I shall be only too glad to make it plain to them if they will write me. It is important that every Wisconsin farmer secure the financial "sinews of war" on as advantageous terms as possible, for crop production depends, in large measure, on an ability to obtain money easily when it can be best expended in making our farming operations either more extensive or more efficient.

EXEMPTING THE FARMER FROM THE ARMY.

I AM in receipt of many letters from subscribers, commending my stand on the subject of exempting farmers from service in the army. Several of my farmer-correspondents raise the interesting question of the uselessness of the city boys who are flocking to the farm in such large numbers at present (in the hopes of escaping conscription) compared with the worth of the experienced and efficient farm hand, who has made a business of following the plow for many years. I do not believe I can do better than to quote two of my correspondents, living in widely separated parts of the grain belt.

First, let me print a portion of a letter received from a farmer-subscriber living at Hager City, Wisconsin, who asks to have his name omitted. He was formerly a banker in a prosperous Wisconsin town, but turned farmer some years ago and is as good a tiller of the soil as you will find in many a day's journey. Thrilled by the call of Uncle Sam for troops to take the field, he endeavored to join the officers' reserve training camp, "but was persuaded by army men that I belonged where I am (on the farm) because I am an experienced farmer." This man writes me, in part, as follows:

I consider your article, "Exempting the Farmer From the Draft," very timely and believe the matter should be brought to the attention of the proper officials at once. * * * The government wants us to raise all we can and seems to think that we can break records with under-aged and inexperienced city boys. I was talking with a personal friend who is now with the officers' reserve training camp. He told me he could not see why a young man of the farm—experienced and able to be depended upon to do things right—of draftable age, should be exempted, that we farmers could get along with boys under age and boys from the city. I do not agree with him at all. I have tried city boys on the farm until I am tired of them and would rather struggle along alone and do what I can and leave the rest go undone, as I would not then be throwing money away. Now is no time to be trying out green and usually shiftless boys, who think of nothing but sundown, bacon, pay day and a good time. As soon as they have a few dollars coming they are ready to quit and spend it and then look for another job. It certainly seems to me that they should exempt men now working on the farm, if they are experienced, and use the other men first. Then, if they really need these men later on I would gladly say "take them and we will make the best of it." Any time that Uncle Sam wants me personally I am ready to go, but if he doesn't need me because I am a farmer it would seem that he doesn't need my experienced help, all other things being equal.

I consider this a splendid letter. It breathes patriotism and a devotion to high farming ideals. I believe it expresses the convictions of a great number of my subscribers. Certainly, it expresses my own views, in most admirable manner.

Here is a letter along somewhat similar lines, written to me by Mr. George Worneldorff, of St. Paul, Kansas:

You are certainly using fine judgment in your stand in regard to leaving the young men on the farm who will come under the age limit to be drafted in the army. When the men from twenty-one to thirty-one are taken from the farm you have taken the cream of the farm labor, and while it is all right to encourage the city boys to go to the farm where they may be of service, they could not take the place of the young man reared on the farm who understands handling machinery and planting, cultivating and harvesting the crops.

I have been engaged in farming in Kansas for over forty years and run a 400-acre grain and stock farm, and I believe one good farm hand who has had a life of experience on the farm is of more use to the farmer at present than any number of inexperienced men. No good experienced hand should be taken from the farm at this time if we are to raise the produce the government needs. Farming is a trade not learned in a few days, or a year.

I do not want you to think these are all the letters I have received on this subject; they are simply typical of the vast number. The authorities at Washington have ruled that farmers, as a class, are not to be exempted from army service, but that they will be excused, as individuals, where it appears they will be of more service in the field and feed lot than in the training camp and trench. It is up to the individual. If he is a good farmer he can do more by raising bumper crops than he can by carrying a musket. If he is a poor farmer he will probably make a poor soldier, but it is up to Uncle Sam to use him as he thinks best. A poet, writing in the current issue of Collier's Weekly, expresses it splendidly when he says:

Our garden beds and fertile farms
  Shall yield the strength divine
That nerves the mighty man-at-arms
  And builds the battle line.

Then bravely to your labors,
  My lads that dig the loam!
Your blades of wheat are sabers
  That strike for flag and home.

And though ye gain but little thanks
  That wield the spade and hoe,
Your hills of corn are stalwart ranks
  That march against the foe!

THE MAN WHO WINS WARS.

IF ANYTHING more were needed to prove the Napoleonic theory that an army travels on its stomach, and to show that the farmer who raises the produce which feeds an army is entitled to as much credit for the victory as the general who directs a campaign and the soldiers who execute the orders, even at the cost of their lives, it is to be found in the press dispatches of the last few days. I have before me, as I write, a half dozen or more items which I have clipped from the newspapers within the last few days which prove so clearly the important part the farmers of Wisconsin, in common with their fellow farmers throughout the nation, will play in the war that I cannot refrain from printing extracts therefrom.

Here, to make a beginning, is a dispatch from Amsterdam, quoting the German imperial vice chancellor as saying:

England's war of starvation has from the first brought clearly before the eyes of the German people the fact that Germany stands or falls with its agriculture. Owing to the activity of the submarines and the failure of the harvests, England, too, is thrown back on its agriculture.

Could anything be more emphatic proof of the fact that, while the soldier in the trench and dugout and on the battlefield is giving up his life for his country, the man behind the plow is the man who, in the final fight, will either win or lose for his country?

Here is an editorial which appeared in the London Daily Mail, pointing out the necessity of releasing farmers from the army and returning them to their fields:

Release the plowmen! If the crop of 1917, upon which a large number of persons in this country are depending for food, is to be saved, skilled agricultural workers in the army must be instantly released to work on land for the next six weeks or so. A semi-famine in 1918 can only be averted by instant action.

My readers may recall that when Lloyd George was placed in charge of the bureau of munitions of Great Britain, his first order was to return to the factories the mechanics who had formerly worked there, but who had enlisted and gone to the front. He knew they were more valuable making shells than they were firing them, so he called them back. Now the eyes of England are opened to the fact that the farmer in the field is a better fighter than the farmer in the trench, the man behind the plow a more important figure than the man behind the gun.

Here is another dispatch from London, showing how the soldiers, home on furlough, are put to work hoeing gardens and increasing national production:

The British Tommy, home on leave from trench-digging and guarding the line, now passes most of his time digging and hoeing truck gardens in his native land. In doing this he is augmenting the land army of civilians at home and the thousands of soldiers in training at the various military camps in England who find time to do their "bit" in the gardens. Throughout the length and breadth of this island, around the military camps and especially along the railway lines, may be seen well laid-out gardens or allotments. In February there were 25,000 of the plots under cultivation in this country, thus giving some idea of the speed with which the people have taken to the spade and plow since the authorities have tried to arouse them to the danger of starvation as threatened by the submarines. The government threatened to commandeer idle land unless it was cultivated. The result was that farmers everywhere got busy and there is now very little land "going to waste." Flower beds are barred; only foodstuffs are to be raised.

Right in line with this is the dispatch which quotes Sir Arthur Lee, director general of food production of England, as saying: "We want 2,000 American tractor plows for the use of a civilian army of night plowers which we are about to enlist throughout the British Isles." He added:

Behind every plow will be a skilled farmer. They will be assisted by prisoners, conscientious objectors, members of the home defense forces and women. This way we hope to produce enough food to make us independent of outside help so long as the war lasts. We do not believe we will be able to produce sufficient to feed the population in time of peace, but are confident we will be able to grow enough to stave off starvation during the war. For this we thank the German submarines. They already have given England an agricultural policy which is destined to make us to a large extent self supporting. The submarines also have revived rural life, given the farmers a minimum wage and generally made our national defense more effective than a thousand speeches in parliament.

My friends, these dispatches are very convincing to me. They prove to me that the farmer of Wisconsin and the other great agricultural states of the Union is the man upon whom rests ultimate victory or defeat.

A LIBEL ON FARM WOMEN.

I AM indeed grieved to find the magazine which publishes the wonderfully good and true-to-life articles of David Grayson, the rural philosopher, printing a rank libel on the farm woman. That this libel should have been written by a grain-belt author—born and reared here "in our midst," where the spirit of farming should strike a responsive chord in every breast—makes the matter all the more regrettable. I am reprinting the libel because it is typical of the writing of some authors, who do not seem to be able to catch the rural spirit in any manner whatsoever, notwithstanding the fact that none is more sympathetic, more understandable or more freshly and frankly delight-

(Concluded on page 5.)

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin Legislature.

If you have a Ford car or any other car or implement repaired in the future the mechanic who makes, alters or repairs such an article of personal property at the request of the owner is entitled to a lien thereon for his charges providing they are reasonable and just. The legislature has placed on the statute books at this session a modification of the present law which will have a far-reaching effect. The law concerns only those who do not pay. Farmers are not usually included in this class, but a knowledge of the law will do no harm. The lien given takes precedence over any chattel mortgage upon such property for all charges not exceeding $75 in amount. For the excess in amount over $75 the lien given by this law is subject to the lien of any chattel mortgage. It is possible under the law to file a lien at any time. The lien will not apply except to unpaid payments. If the principal contractor has been satisfied a sub-contractor cannot have a lien against the property.

The Governor has also signed a bill appropriating $8,000 for the purchase of live stock for the Waupun Prison Farm. This bill followed the one recently approved appropriating $78,000 for the provisions of the farm from the unexpended balance of the twine plant.

The Governor's anti-whisky bill, introduced in the Senate and defeated by that body, about winds up the anti-liquor program for this session. The referendum bill championed by Assemblyman Evjue in the House and Senator Skogmo in the Senate was defeated by the veto of the Governor, who thought it too radical. In his recommendations for a bill prohibiting the sale of beer in excess of 3 per cent alcohol and wine in excess of 10 per cent the Governor incorporated his ideas of sane regulation. A bill containing these provisions subsequently introduced was defeated by Senate and Assembly. Several other bills dealing with the liquor business which were killed during the present session included one to prohibit treating, one which would compensate dependents of a person obtaining liquor in a saloon from the saloonkeeper, one to limit saloons to a ratio of 1 to every 1,000 population instead of 1 to every 500, one to establish a dry zone around the Soldiers' Home at Milwaukee and one to provide for the closing of saloons at eleven o'clock at night. A measure prohibiting the sale of liquor on islands in the Mississippi river was one of the few bills that passed successfully.

The University Extension appropriation bill was concurred in by the Assembly. Of the $25,000 additional voted for University extension $20,000 must be used for other work as required by the State Council of Defense. The bill makes an appropriation of $171,110 for operation, $5,000 for medical extension work and $5,000 each year for capitol purposes. The $20,000 shall be used only in connection with extension work for war purposes, as requested by the State Council of Defense.

The Assembly gave final passage to the bills dealing with tuberculosis eradication which have been previously described in these columns.

A fight will be made against the proposed tax on dogs which purposes to establish a fund to pay for the damages done by dogs to live stock, principally sheep. Sheepmen of the state are in favor of the bill which calls for a tax of $2 to $4 per dog from every farmer in the state. The idea is to have a record of all the dogs in the neighborhood so that damages can be traced. A similar bill was passed by a former legislaturer, but met with Governor McGovern's veto. The chances are that the present bill will not get as far as that. There is still too much misunderstanding on the points for or against such a tax. No one can deprive either the city man or the farmer of the right to keep a dog. The dog is man's natural friend. But dogs have heretofore enjoyed the privilege not enjoyed by any other domestic animal except the housecat. Dogs are left free to roam wherever they choose to go, though it has been proved again and again that all dogs are not useful and therefore not entitled to the freedom that has been allowed them. Other domestic animals are our friends and still we do not permit them to run into the neighbor's field and we ought not to permit the dog to go wherever he pleases. The tax will eliminate the mongrel and protect the well-bred, useful dog.

The Wilcox bill relieving cities and towns from paying the cost of removing railroad crossings was killed by the Senate. The new law would have placed the burden of making street crossings safe upon those who made it unsafe—the railroads. The defeat of this bill leaves the city and towns to pay from 10 to 50 per cent of this cost out of their own pocket. Thousands of dollars must be expended by the smaller cities of the state for these purposes while in the case of Milwaukee it is reported that the expenditures for street purposes will amount to more than a million dollars, which must come from the people in the form of taxes.

The state fair appropriation bill was engrossed by the Senate after this body had defeated a bill introduced by Senator Bray for the suspension of the state fair during the war. England was cited in the debate as finding such restrictions of little benefit and it is quite unnecessary that Wisconsin give up the fair this year.

Great Events Today.

Happenings of the week are discussed, impartially and accurately, in the department of The Wisconsin Farmer known as Current Events. In addition, the leading happenings are discussed, frankly and fearlessly, by Mr. Pierce in his signed page. Farm progress is detailed not only on the regular editorial pages but throughout every department of the paper.

We believe that the farmer who wishes to keep abreast of the happenings of the time, in his state and nation and in the world at large, cannot possibly do better than to read The Wisconsin Farmer regularly. This being the case, we urge upon all our readers the importance of seeing to it that their subscription is paid well in advance, so that they will not miss a single issue. Friends and neighbors on the farm should also be induced to subscribe, so that they, too, may enjoy the benefits.

Attend to your subscription renewal without delay. The world is afire and the patriotic citizen must keep abreast of the times and know how and when to act in every emergency.

A Loyal Badger Response.

Wisconsin responded patriotically to the registration June 5th, Duty Day, under the selective conscription law. There were more than 240,000 young men between the ages of 21 and 31 registered for war service in this state, and, according to the latest reports as we go to press with this issue of The Wisconsin Farmer, just a few over 96,000 claimed exemption. Wisconsin not only registered its full quota with[illegible] disturbances but had a smaller percentage of exemptions claimed than most of the states thus far reporting. A dispatch which comes to our notice as this is written says that it is estimated 50 per cent of those who registered in the nation June 5th claimed exemption. In Wisconsin only about 40 per cent claimed exemption from service. Wisconsin registrations exceeded the estimate made from the last census and Governor Emanuel L. Philipp had the proud pleasure of sending in Wisconsin's report on registrations first of any state report in the Union. From the farms, from the factories, from the offices, from the scenes of manual labor all over this great state, there was a general response. Richland county was first to get its report to the governor's office and La Crosse county was only a few seconds behind.

All honor to our Wisconsin boys who have thus signified their willingness to meet duty's call when their beloved country is in need.

A PLACE FOR EVERY MAN.

THE BOYS THAT SHOULD ENLIST AND WILL NOT—

OR THE BOY THAT IS WILLING TO ENLIST—AND SHOULD NOT?

Wisconsin Potato Situation.

J. G. Milward, secretary of the Wisconsin Potato Growers' Association, and assistant in horticulture at the Wisconsin Experiment Station, Madison, has found it necessary to correct certain erroneous reports sent abroad concerning the Wisconsin potato situation. Mr. Milward says:

There will be an increase in acreage in the commercial potato-growing sections of the state. This department has discouraged the extensive planting of potatoes by inexperienced persons in non-potato producing sections of Wisconsin. The high price of seed and the growing scarcity of labor made it inadvisable to plant potatoes under these conditions. The statement has been made that the department has discouraged an increase in acreage in order to safeguard high prices in the fall. This statement is absolutely incorrect. Early potato planting conditions in Wisconsin are very satisfactory. Conditions relative to seed and acreage are also satisfactory. Should we have a normal season a very large crop of potatoes is assured.

It is unfortunate that the splendid efforts of the college of agriculture and the State Council of Defense should have been misinterpreted. As Mr. Milward has stated, it was thought ill advice for inexperienced farmers in sections of the state least ad[illegible] to potato growing, to go too [illegible] into the potato business. [illegible] words, it was thought [illegible] good seed in portio[illegible] where it would produce [illegible] only because of climatic [illegible] tions but also because [illegible] uld be placed in the ha[illegible] who had had wide exper[illegible] dling potatoes, and wh[illegible] reason of this experienc[illegible] bushels per acre. It woul[illegible] folly to have advised a fa[illegible] hern Wisconsin, who should raise corn or oats, to have gone heavily into the potato business this year, just because potatoes had reached an abnormal price. The state departments have been entirely right in their work and we believe the crop in the fall, conditions being normal, will justify their recommendations. As to prices for potatoes the coming fall and winter no one has the slightest fear of overproduction or prices which will fail to net good incomes on investments and work.

Waste No Food.

Already it has been demonstrated that the ultimate outcome of the war will largely be determined by the amount and character of the food supply, and since the United States has entered the conflict this country is looked to for enormous exports of food products during the next twelve months. The 1917 crop is now in the ground and we can do nothing to increase the yield but to give intertillage crops sensible care. In the meantime, every man, woman and child can perform a real service to the country and to the great cause by preventing waste of foodstuffs.

A statement recently made by Secretary of Agriculture Houston brings an astounding fact to our attention in reference to the enormous annual food waste in this country. He says for partial immediate relief every individual and community should consider earnestly the matter of food conservation and the limitation of waste. As a nation we seem to have a disdain of economizing. "In many homes," says the secretary, "there is a strong feeling that it is 'only decent' to provide more food than will be eaten and that it is demeaning to reckon closely. The experts of the department of agriculture report that the dietary studies made by them point to an annual food waste of about $700,000,000. Of course, the waste in families of very limited means is slight, but in the families of moderate and ample means the waste is cons[illegible]. Even if the estimate were reduced by half, the waste would still be enormous."

[illegible]e in the household re[illegible] measure from bad prep[illegible]d bad cooking, from im[illegible]are and handling, and, in well [illegible] families, from serving an undu[illegible]ber of courses and an overabun[illegible]nt supply and failing to save and utilize the food not consumed. As an instance of improper handling it is discovered that in the preparation of potatoes 20 per cent of the edible portion in many cases is discarded.

Food is wasted when too much is served at a meal. Uneaten portions are left on the plate and later thrown into the garbage pail. Learn to know the needs of your family and serve

FAMILY CIRCLE TALKS—By The Publisher.

ful. Here is what purports to be a description of the farm women of the grain belt, where the action of the story is located:

A worn and dreary lot, these farmer women, living a skimmed-milk existence, putting their youth, and health, and looks into the soil. They used often to sit back near the stove in winter, or in a cool corner near the front of the store in summer, and reveal, bit by bit, the sordid, tragic details of their starved existence. Fanny was often shocked when they told their age—twenty-five, twenty-eight, thirty, but old and withered from drudgery, and child-bearing, and coarse, unwholesome food. Ignorant women, and terribly lonely, with the dumb, lack-luster eyes that bespeak monotony. When they smiled they showed blue-white, glassily perfect false teeth that flashed incongruously in the ruin of their wrinkled, sallow, weather-beaten faces. Mrs. Brandeis would question them gently.

Children? Ten. Living? Four. Doctor? Never had one in the house. Why? He didn't believe in them. No proper kitchen utensils, none of the devices that lighten the deadeningly monotonous drudgery of housework. Everything went to make his work easier—new harrows, plows, tractors, windmills, reapers, barns, silos.

Fearing that her picture might be immediately branded as a base libel, the writer has sought to tone down its crudeness and glaring defects by asserting that it is a picture of farm women "before the day when every farmhouse boasted an automobile, a telephone and a phonograph." Does this far-fetched attempt at an apology hold good, however, when we reflect that the magazine writer has the farmer spending his money for tractors and silos "before the day of the farm automobile and phonograph," when the fact is that these four were introduced to the farm and adopted by the farmer at practically one and the same time? In my opinion, the libel has come about from the lack of sympathy with the farmer and with farming, which is prevalent in all too many of those who are producing our current literature. More than ever, it convinces me that we need a school of writers in sympathy with the soil, the men who till it and the devoted women, who, in word, deed and appearance, are proof of the uplifting nobility of our country life. Is it not high time that our magazine and book writers were studying the farmer and his family and ending these libels and caricatures, which masquerade as true-to-life pictures, to the great injury of those thus held up to scorn?

Some day an epic of the cornfields and the wheat fields will be written which shall disclose the farmer, his wife and his family as the real-true, simon-pure Americans. Hasten that day!

THE KID HAS GONE TO THE COLORS.

I CONFESS to being a great lover of poetry. Therefore, when I find some bit of verse that appeals especially to me, I feel like passing it along, so that all my readers may enjoy it with me.

Last week we saw the boys from the farm and the boys from the town and city registering for Uncle Sam's army, ready to do their bit in the trench and redoubt, if necessary. Not all the boys who registered will be called to the colors, but one in ten or twelve will be; and it may be your boy or mine; nobody knows. It is with this feeling of solemn uncertainty that I pass along to you, this week, the verses entitled, "The Kid Has Gone to the Colors," which I found in the Indianapolis News:

The Kid has gone to the Colors
And we don't know what to say.
The Kid we have loved and cuddled
Stepped out for the Flag today.
We thought him a child, a baby,
With never a care at all.
But his country called him man size,
And the Kid has heard the call.

He paused to watch the recruiting,
Where, fired by the fife and drum,
He bowed his head to Old Glory
And thought that it whispered: "Come!"
The Kid, not being a slacker,
Stood forth with patriot joy
To add his name to the roster—
And God, we're proud of the boy!

The Kid has gone to the Colors;
It seems but a little while
Since he drilled a schoolboy army
In a truly martial style.
But now he's a man, a soldier,
And we lend him a listening ear,
For his heart is a heart all loyal,
Unscourged by the curse of fear.

His dad, when he told him, shuddered,
His mother—God bless her!—cried;
Yet, blest with a mother nature,
She wept with a mother pride.
But he whose old shoulders straightened
Was granddad—for memory ran
To years when he, too, a youngster,
Was changed by the flag to a man!

James M. Pierce

each no more than you think he will want.

Food is wasted when too much is prepared for a meal. Unserved portions are likely to be thrown into the garbage pail or allowed to spoil. Many housekeepers do not know how to use left-over foods to make appetizing dishes.

Food is wasted when burned or spoiled in cooking. Improperly prepared or poorly seasoned food will be left on the table and probably wasted. Buy food wisely and then prepare it carefully.

Food is wasted when handled carelessly. Buy clean food, keep it clean until used, and be neat in all details of cooking and serving. This lessens waste and is a valuable health measure as well.

Food is wasted when we eat more than our bodies need for growth and repair and to supply energy for our work. Overeating tends to poor health and fat instead of brawn, makes us sluggish and indolent instead of energetic and resourceful. Eat enough and no more. Eat for physical and mental efficiency.

The World Shortage of Food!

The growing shortage of food products is brought home by the official statistics for various countries showing the increased cost of food since the beginning of the war. In the United States the average increase for all foodstuffs has been about 25 per cent, but a food unit made up of flour, potatoes, salt pork, beans, molasses, sugar, corn meal, milk, oatmeal, tea and soup, which cost $2.36 in 1915 and $3.07 in 1916, now costs $5.10, or over 100 per cent increase in the past two years.

Another angle on the high cost of living is afforded by a comparison of the facts that $10 would buy as much food in 1904 as $28.33 would buy last May, and $15 in September, 1916, would buy as much as $24.91 would buy in May, 1917.

While rents and clothing have not advanced proportionately, the above facts show the need for unusual economy, both in money and in food, which is facin[illegible] people of this country. Matte[illegible] kind, which are everybody's [illegible] are likely to become nobody'[illegible], and each of us is apt to fo[illegible] responsibility which he owes [illegible] thinks of the insignificant e[illegible] his own little personal savi[illegible] accomplish. However, natio[illegible] thing more than the individu[illegible] raised to the millionth de[illegible] only way that anything c[illegible] mplished is by each one [illegible] personal sense of responsib[illegible] the matter. The waste of [illegible] nce of edible meat or fat b[illegible] he 20,000,000 families in the United States each day means a national daily loss of 1,250,000 pounds, or nearly half a billion pounds annually—sufficient to keep a small European nation from starvation.

In urging greater use of corn products for family use, the department of agriculture believes that one of our greatest sources of economy lies. It is asserted in this connection that less than 10 per cent of our 3,000,000,000-bushel corn crop is used for human food, though it lends itself admirably to many such uses. Corn bread promises to become a much more common sight on the table of every American home in the months and years to come than it ever has been, and thus to contribute its share, not only to the health and strength of the race, but also to meeting the shortage of wheat.

Nor is the United States alone in its problems. Indeed it is in some respects far better off than its sister nations of the earth. Since the war began average British food prices have advanced nearly 100 per cent as compared with 25 per cent in this country. In Austria the advance has been 172 per cent; in Italy 70 per cent and in Canada 38 per cent. However, in Canada loaves of bread weighing one and a half pounds sell for 12 cents, as compared with 15 cents in Chicago, which leads to the thought which The Wisconsin Farmer has formerly expressed, that the government investigators should turn their attention to the speculators and commission men for an explanation of the advance in food prices rather than to the producer.

It is a world shortage we are facing, and every reader of The Wisconsin Farmer should feel it his duty to do what he can, not only by increased production where possible, but also by personal economy and care, to help meet the serious situation for humanity's sake, as well as for selfish reasons. A good citizen has been defined as a man who regards an obligation as sacred whether it can be enforced against him or not, and The Wisconsin Farmer is sure that the farmers of Wisconsin will feel their obligation in this matter and embrace it as an opportunity to help their fellow men, rather than regarding it as a burden to be avoided where possible or, at best, endured grudgingly.

Worcester Holstein Sale.

In this issue will be found a detailed report of the National Guaranty sale, held June 7th and 8th at Worcester, Mass. Our readers had expected a big sale and a high average for the Holstein stock offered at this sale. But they did not expect that 143 head would sell for an average of nearly $1,000 more per head than was paid for the offerings at Detroit last June. We are pleased to note th[illegible] the stock offered at Worces[illegible] ing to Wisconsin. But the outstanding fact in connection with the sale is the high valuation which men of sober judgment and experience have placed on good pure-bred dairy breeding stock. Every reader of The Wisconsin Farmer should review carefully the sales made at Worcester and by so doing he will get a clearer estimate of the almost limitless opportunity now offered breeders of pure-bred dairy stock. The Wisconsin men who attended the Worcester meeting of the National Holstein Breeders' Association have returned to their home state, determined to place Wisconsin in an even higher position in the Holstein-Friesian world. We have the natural advantages to accomplish this desired end. We have breeders of integrity. Wisconsin stock is already in great demand in the West and Southwest. Wisconsin breeders can get prices in proportion to their improvement in the quality of breeding stock. At some not far distant day Wisconsin should have the National Holstein-Friesian Association meeting and a sale which would eclipse anything in the line of dairy sales ever held in this western country.

Approves Road Dragging.

F. W. Swant, a Wisconsin Farmer subscriber in Barron county, writes us in response to Mr. Babcock's road article, published in The Wisconsin Farmer May 31st. Mr. Swant heartily approves the road dragging plan which has been worked out successfully in Sauk county, and he believes this plan gets the most good roads for the greatest number of farmers. He writes as follows:

As I was reading your article in the May 31st number of your paper I thought it might be well to let you know what we are doing in Barron county with the road drag. Some years back the county board passed a resolution to set aside the county's share of the auto licen[illegible] tax and pay for half of the drags and dragging, but as the state law only allowed 50 cents per mile for round trip there was not very much done. In some towns nothing was done while a few did enough to show the public the benefit of the drag and the June session of 1915 passed another resolution paying for half of the drags and the towns paying the other half and the county paying all of the dragging at 75c per round trip mile and the automobile tax pays it all. Although our 1917 state legislature has taken the tax away from the drag fund after this year the county should not let the dragging stop. It is the best thing we ever did with our roads and it should be kept under the county system for the towns having cities in them have so much more on the roads near the cities and the whole county use these roads, for we all go to town. The system is under the county and state aid highway commission and they appoint the chairman of each town board to take care of his respective town.

Three miles is all one man can drag and take care of and shorter stations are better in order to have the work done in the right time. The road drag is the cheapest and best road maintenance there is. What we need is more light grading and dragging. The old system of grading the roads and letting them go to pieces until they get impassable and then regarding it too expensive and little good is the result.

It is undoubtedly true that a very large per cent of farmers may be well served by better dragging and grading of the roads. The grading of course is first and the matter of drainage must be looked after. Then keep the roads well dragged and it is surprising what good results may be obtained. The highway commission has recently adopted a resolution to the effect that new road work should be reduced to a minimum, for the present, due to the heavy general taxes and the additional war taxes which will be assessed against us for some time to come—we do not know how long. The Wisconsin Farmer takes the position that we can afford to proceed regularly with road work despite the war—that is, all existing roads should be kept in a good state of repair, and new good roads added as the taxpayers in the towns and counties feel they are able to pay for them. The country will probably be even more prosperous, at least for a season, as a result of the war, hence a policy of strictest retrenchment is not needed at this time. But we have always felt that roads, paid for by taxpayers, should serve as large a number as possible, of the taxpayers who pay for the roads. The beginning of all road betterment is improvement of the dirt roads, the natural roads, as they are built up by grading and drainage. A great deal of campaigning has been done for trunk line roads, and our only suggestion in this regard is that the farmer who does not happen to live on the trunk line road, should have some benefit from the taxes he pays, to the extent of improving, at least by grading, drainage and dragging of the road which passes his door. We delight in traveling over Wisconsin's good roads, but we cannot help remembering the farmer who is several miles off this road, and we believe it is the duty of those who administer the expenditure of taxes to spend time, effort and money so as to accomplish, as nearly as may be possible, an equal distribution of benefits to all who help keep up our road systems by paying taxes.

The Wisconsin Farmer has no fight on better road campaigns, but we feel a most important part of the good roads movement, which is now general, is to keep the natural roads in condition. The road drag is the most efficient instrument yet discovered for this important work.

Practically every farm of considerable size in northern Wisconsin is equipped with a tractor, according to a statement made by C. P. Post, agricultural agent in that territory. Those who have tried the tractor claim that it is much more satisfactory than horses for plowing, disking and dragging cut-over land.

The National Guaranty Sale.

New Price Records Fixed For Live Stock at the Big Holstein Sale Held Last Week in Worcester, Massachusetts.

The National Guaranty Sale, held at Worcester, Mass., June 7th and 8th, far eclipsed even the most hopeful anticipations generally voiced at the national Holstein meeting, held the day prior to the sale. It was a sale that has already gone down in history as the greatest of all public auctions of live stock. Practically every record was smashed and the average for the 143 head sold is almost appalling. Never before has the future of the Holstein business looked so promising. It is seldom that such enthusiasm is witnessed as was shown at this great event. While the cattle assembled at Detroit last year far surpassed any collection of Holstein cattle that had ever been gotten together before, the animals sold at Worcester likewise greatly outclassed those sold a year ago at Detroit. One hundred forty head of cattle sold this year came within $2 of averaging $1,000 more per head than the 140 head sold at Detroit. The total number of head sold this year was 143 and they averaged $2,073.21. The first 50 head sold averaged $2,028.10 and the first 100 head $2,089.10. As was generally prophesied before the sale, King Ormsby Jane Rag Apple proved to be the sensation of the sale. Mr. Cabana therefore has the honor of topping both of these national Holstein sales. It will be remembered that a year ago a half brother topped the Detroit sale at $20,000. The dam of the calf sold this year is conceded by a larger number of the greatest judges to be the best living cow of the breed. Ormsby Jane Segis Aaggie is still a young cow and may even surpass her own matchless record. Probably the other greatest sensations of the sale were Mr. Howe's 42-pound world's record two-year-old that sold for $18,000 and Mr. Pelletier's world's record junior four-year-old that sold for $18,300. Her two sons brought $8,700, making a total for the three head of $27,000. Buyers came from coast to coast and as far south as Georgia. Wisconsin took some of the choicest animals of the sale. Practically all of the cattle sold to Wisconsin go to Waukesha county. Waukesha county has very good grounds for claiming that they purchased a bull calf that stands second only to the $53,000 bull. None of the other 40-pound bulls have dams with yearly records that approach that of the dam of their bull. Woodcroft Perfection is now Wisconsin's highest record bull and was purchased for $5,200 by Aitken Bros., Baird Bros., S. A. Baird & Son, Muckleston Bros. and D. J. Howell, all of Waukesha. Aitken Bros. purchased a beautiful 31.44-pound cow for $3,225 that was one of the choicest cows of the sale, and also a choice yearling heifer consigned by D. W. Field & Co. for $1,825. The Alfacorn Dairy, owned by F. B. Greene & Son, Evansville, purchased a good 30-pound calf. The following is a list of sales:

Antrim Lyons De Kol, Mar. 21, 1916; A. M. Smith, Melrose, Mass. ..... $ 275
Queen Segis Hartog Walker, Jan. 20, 1916; Elliot D. Curtis, Bantam, Conn. 300

GROUP OF WISCONSIN MEN AT THE NATIONAL GUARANTY SALE HELD AT WORCESTER, MASS.

Every Acre-Every Fence Corner Must Be Tilled This Year

DEALERS!

Here's a light tractor proposition that you can sell under an absolute guarantee of satisfaction to the buyer. The pioneer Ford tractor attachment of them all—a tried and **proven** success on thousands of farms—we are offering you for a short time only, the opportunity to sell TRACFORDS in **your** territory on most liberal terms.

TRACFORD agents have sold as many as 15 to 20 machines in a single demonstration—hundreds have sold out their allotment in a few days. So write or wire us for dealer information **at once!** This offer will remain open for only a short time.

Write or wire us TODAY

The food supply of the world is practically exhausted. Our success in the war is dependent upon the American farmer—and upon America's 1917 crops.

To meet the demand, every tillable acre must be put under cultivation—every small tract and fence corner must be profitably planted. The foresighted business man is planning on plowing every foot of his ground—*and plowing and planting right up to the fence line.* That is why thousands of American farmers are buying the

TRACFORD

"The Tractor Universal"

$125 F. O. B. Detroit

—the dependable and **proven** attachment for converting Fords into light farm tractors. With the TRACFORD, you can quickly turn your Ford car into a powerful tractor unit—a tractor light in weight and with a short turning radius, making it a most practical plowing machine for cultivating the open field—the small strip of land. Its short turning radius makes the TRACFORD splendidly adapted for orchard work—for working in and around—"to" and "away" from the trees.

The TRACFORD plows only on high gear—and is capable of doing any farm work formerly done by three good horses. It is the tractor unit for **you**—for **your** work—and **your** farm.

Let us put you in touch at once with the TRACFORD dealer in your district who can **prove** to you—with a demonstration—the possibilities of the TRACFORD on your farm.

Colantha Aaggie Maid Mutual, sired by Colantha Sir Aaggie, dam Colantha Maid, 28.[illegible] lbs., bought by H. E. and R. E. Aitken.

CURRENT EVENTS

ARMY registration day passed, last week, without any untoward incidents. A few miners in Butte, Mont., and some of the Indians on western reservations endeavored to make trouble, but for the most part the men between the ages of twenty-one and thirty-one went to the registration places with a sense of the solemn duty of the occasion and without attempting to evade the law in any manner. The returns for the country are not all in as yet, but every indication points to an enrollment passing the 10,000,000 mark. It is proposed, within the next few weeks, to have about 1,000,000 names drawn from this great total, in the effort to have an army of 650,000 ready to start training by the first of September. Approximately one-half of all who registered last week either claimed exemption or announced that they would claim it in the event that their names were drawn. So that of the 1,000,000 names selected in the first draft, hardly more than 500,000 men will be found eligible for the army, even if that many. Names will continue to be drawn, however, until enough have been secured. The army will be trained and established in sixteen camps scattered throughout the country, in permanent quarters and under regular-army officers. It is not likely to see actual service in Europe for another year at least, as the regular army will be sent over first, to be followed in the late fall or early winter by the National Guard, now being mobilized in the various states.

THE war-tax bill, by which the government proposes to raise at least a part of the fabulous fortune needed for current war expenses, will reach the United States senate some time this week, the senate finance committee having wrestled with it for the last three or four weeks and having practically finished their task. Many changes will be made in the bill as it passed the lower house. The second-class mail rates will probably remain as they are, a tax on newspaper and magazine advertising to be imposed instead. Letter postage will be raised to three cents an ounce and postcards to two cents apiece. Stamp taxes will be imposed quite generally. Prohibitive taxes upon distillation of whisky and other spirits for beverage purposes with a ban upon their importation have been agreed upon by a substantial majority of the committee. Taxes fixed by the house on beer and wines were left unchanged, though they have not yet been finally approved. General suspension of beverage production by distilleries and use of liquor now in bonded warehouses probably would be the effect of the new tax section if enacted into law. Manufacture of alcohol for industrial, mechanical and medicinal purposes would not be affected. In addition to the present tax of $2.20 per gallon on the liquor, a tax of $20 per bushel (from $5 to $9 a gallon upon all grain, cereal or other foodstuffs used in manufacturing whisky or other distilled spirits for use as beverages) was written into the bill. Increased taxes of $5 per gallon upon molasses, sirups and substitutes used in distillation for beverage purposes also were agreed upon.

PRIVATE advices from Germany tell of growing dissatisfaction among the people at large with the political results of the ruthless submarine campaign and the absence of any indications that it has brought the desired peace near to hand. During their long campaign for the unrestricted use of submarines the advocates of this measure made very definite promises of immediate results. "Two or three months" was the phrase used everywhere in street and newspaper arguments in regard to the time it would take to bring England to her knees, ready for peace. Even though the official propaganda has since declared the government bound itself to no particular time to produce results, the prediction that they would be obtained in two or three months has remained in the minds of the people. Grumblings are now heard that, although four months have passed, England shows no signs of weakening, but on the contrary seems determined to prosecute the war more bitterly than ever.

A RESOLUTION urging the American people to eat less meat and more corn, rice and barley products as substitutes was adopted by the house of delegates of the American Medical Association, in convention in New York City. The memorial will be sent to President Wilson, Herbert C. Hoover and to congress. The federal food board is requested in the resolution to appoint a scientific committee of physicians and other experts on diet and nutrition to act, without pay, in an advisory capacity, and to provide such a commission with means for a public campaign regarding nutritional foods "as well as to warn the public that high prices will deprive both the poor of our country and our allies in Europe of meats, breads and other foods necessary for health, efficiency, and even life itself."

EVIDENCE that two complete high-powered wireless installations, assembled in New York City, from various sources, were shipped piecemeal to Mexico, supposedly for use of a German spy system in this country, was unearthed in connection with the arrest of three men on charges of conspiring to send mail containing military information surreptitiously from the United States to Germany through members of Norwegian ship crews. It was estimated by the United States commissioner before whom the alleged plotters were arraigned, that it was through their instrumentality that advance news of the impending arrival in England of the American destroyer fleet was sent to Germany before it even became generally known in this country that it had sailed.

IT is stated in an official quarter in Washington that Japanese capitalists are negotiating with Mexico with a view of assisting in the industrial and commercial reconstruction of that country and that Mexico is favorably inclined towards the proffered assistance to her financial rehabilitation. Japanese banks, it was said, believe Mexico presents a field for legitimate investment as promising as any visible in the financial world. Japanese financiers, too, are said to be willing to advance money to the Mexican government on terms less onerous than may be obtained in the United States, at the same time winning for their nation the increased friendship of Mexico.

LORD NORTHCLIFFE, at the request of the British war cabinet, has accepted the position of head of the British war mission in the United States in succession to Arthur J. Balfour, who has returned to his duties at the foreign office. Lord Northcliffe's task will be to coördinate the various British missions and act in concert with the missions of the entente allies and of the American and Canadian governments. Lord Northcliffe is well known as a writer and newspaper proprietor. He has been active in British political affairs and recently has been engaged in vigorous support of Premier Lloyd George's home-rule-for-Ireland policy.

CONTRACTS for 750,000 additional pairs of shoes for the new army have been awarded at an average price of $4.75 a pair. With these contracts the government has ordered 3,360,000 pairs of shoes for the army and 850,000 pairs for the navy. Their total cost will be about $20,000,000. Julius Rosenwald, chairman of the committee on supplies for the council of national defense, estimated that the government had saved $2,000,000 on the transaction by arranging for supplies of leather without advertising for bids.

Agricultural and live stock interests, protesting to the Interstate Commerce Commission against the railroads' proposal for a 15 per cent general increase in freight rates, declared that such a revision not only would unjustly burden food producers, but would handicap seriously the whole food production campaign initiated by the government as a war measure.

Lord Devonport, the British food controller, has issued an elaborate order regulating the sale and prices of meat, including live animals. The order prohibits speculative re-sales, eliminates jobbing transactions, and states what profits shall be permitted to dealers and the cost of the carcasses.

Willard STORAGE BATTERY

Willard Gives You TRIPLE Service

Storage Batteries need *continuous service* throughout the whole time they are in use, and to assure the car owner of satisfaction that service must be three-fold.

Willard is the only battery maker that is actually giving all three kinds of service.

1. ***Built-in Service.*** Good quality means saving a lot of expense for repairs. Willard quality costs more money, but that it *pays* is absolutely proven by the fact that *over 150 car builders* use Willards on their cars exclusively.

2. ***Trouble-Preventing Service.*** Willard publishes booklets—free to car-owners—telling them exactly how to take care of a good battery and avoid the little errors that cause battery starvation, over-heating and other injuries.

3. ***Trouble-Curing Service.*** Even the best battery ever made will not last forever. Some day it will need to be overhauled and put in good condition again. Willard maintains over 950 service stations like mine manned by trained battery experts, so that battery owners can depend on skilled workmanship and reasonable charges.

Write to the Willard Storage Battery Company, Cleveland, Ohio, for the booklet, H-6, "What's Your Battery Worth," and list of the 950 Willard Service Stations.

Meanwhile, ask your dealer about the expert service I'm equipped to give you.

The Willard Service Station Man

Guernsey Men at McKerrow's

Threatening Weather and Rain Fail to Interfere With Successful Meeting of Western and Waukesha County Associations.

GUERNSEY men of the Western Guernsey Breeders' Association and Waukesha county h ld their summer meeting and picnic on June 6th at the George McKerrow farm at Pewaukee. About 500 people attended, though most of them came doubtful of the chance of a nice day and all left convinced that the weather man plays no favorites. Rain and wind tried hard to break up the meeting, but every one stayed until the meeting was over. The business meetings of the two associations were held in the morning. The Western Guernsey Breeder:' Association again discussed the matter of employing a field man and decided to take no action until a more thorough canvass of the breeders of Wisconsin, Minnesota, Iowa and Illinois had been made and enough contributions received to carry the work for at least one year. The plan of charging each association member according to the number of animals in the herd will provide sufficient funds to employ a good man and defray all expenses for more than a year. The committee in charge of this work believes that $2,500 will be sufficient to start with.

The suggestion made at the winter meeting of the association at Madison for a new classification for all cows carrying their calves for 265 days of the test was reported as favorably acted upon by the national association and fourteen classes are thereby established instead of seven. The only difference between the previous classification and the new classification is the credit each animal receives for carrying a calf 265 days during the time she is making her yearly record. The cow meeting the requirements for Class A or Class B, and so on, will receive the classification of "A A," "B B," and so on, under the new ruling. Cows not carrying a calf during the test period for the time stated will still receive credit according to the old classification. A suggestion which will be called to the attention of the national association to simplify this plan was made by Mr. Ehrbach, of Helendale Farms, near Athens, Wis. He suggested that the various classes be distinguished by ribbons of the colors now used in the show ring. Another suggestion was to color the official papers of the various classes, so that one could tell at a glance in what class the cow had finished her record.

Chas. L. Hill, of Rosendale, placed before the association a set of rules for the standardization of practices between buyers and sellers. The members were asked to give these suggestions their consideration until the winter meeting, when they will be brought up again for endorsement. The recommendation of Mr. Hill could well be applied to all breeds of cattle as well. They are as follows:

All prices made are f. o. b. at seller's station and animals to be expressed are to be crated by the seller and crate to be returned at the expense of the seller.

All animals to be shipped with a good halter on.

Every bull over one year old to be guaranteed to be a breeder, providing the buyer's cows are in good condition. If not a breeder, to be replaced at the option of the seller by one equally as good, or to be returned to seller and purchase price refunded. In case of exchange, the buyer and seller to each pay transportation charge one way. If taken back and price refunded, the seller is to pay transportation charges.

Every heifer sold over one year old guaranteed to be a breeder. If not a breeder to be taken back or exchange made on same basis as for bulls.

Every cow sold guaranteed a breeder or exchanged on same basis.

Seller to call attention to any unsoundnesses of udder or other defects.

If an animal sold as a heifer has a defective udder at calving the loss is the purchaser's.

Registry and transfer certificate and tabulated pedigree should accompany every sale.

In regard to tuberculosis, it is recommended that in states where provision is made for state accredited herds, that all members have their herds so enrolled.

Where the buyer tests an animal inside of three months after purchase and finds an animal tubercular with no other reacters in the herd then the loss shall fall on the seller, unless he is able to show a test of his herd within ninety days before sale and that there were no reacters in his herd.

It is urged that when the seller knows his herd is affected with abortion that he so inform the buyer.

"A Balanced Ration For the Crops" was the topic selected by Dr. Cyril G. Hopkins, of the Illinois Experiment Station, chief speaker of the afternoon. The results of the Illinois Experiment Station have been followed closely by investigators all over our country. Our sister state to the south has done more work along crop production lines than any state in the central West. The findings of Doctor Hopkins and his associates have been valuable, because Illinois farmers have tried out the recommendations made and have found them practical and economical in increasing acreage yield. According to Doctor Hopkins, the five essentials necessary for plant growth which man must provide are nitrogen, phosphorus, calcium, magnesium and potassium. Barnyard manure contains all of these elements in varying amounts. Lack of sufficient fertilizer of this kind, however, is quite common and in such cases the supply must be met by the addition of the elements according to the wants of the soil. Limestone or dolomite, when added to the soil, supplies calcium and magnesium. Wisconsin soils, with the exception of some sections in the peat regions, are plentifully supplied with potassium. Phosphate rock, bone meal and acid phosphate all carry phosphorus, and, depending upon the conditions of the soil, phosphorus is added by means of one of these three. Humus for the soil is supplied by green manuring and through applications of barnyard manure. Both these forms are made more efficient by the addition of calcium. Calcium, humus and phosphorus with legumes supplying the nitrogen will keep a soil in excellent condition. A ten-year average for corn at the Illinois station on fields with manure and calcium and phosphorus present in the required amounts gave an average of eighty bushels to the acre. The absence of manure reduced this yield to seventy-eight bushels. Crop residues plus calcium and phosphorus, with oats, gave a ten-year average yield of 62.3 bushels. The addition of manure to this field increased the yield to 63.2 bushels. The difference in the fields having phosphorus and no manure and those having phosphorus and manure is not so great as when no phosphorus is added, except with the manure. The manure shows up stronger when applied alone, because of its phosphorus content. When phosphorus is applied in some other way the value of the manure is less noticeable. It is then valuable as humus. Balanced with calcium and some phosphorus manure gives excellent results. A four-year average at the Illinois station with alfalfa in rotation, plus manure, gave 2.8 tons of alfalfa against five tons where calcium and phosphorus were added to the manure and the crop residue turned under.

A motion to buy $250 worth of Liberty bonds by using a part of the investment fund of the Guernsey breeders' association was seconded and carried before the meeting adjourned.

Growing Field Beans.

To the Editor:—The prevailing high prices for dried beans coupled with the general scarcity of food products have created much interest in this crop.

Climatically, the bean is a hot weather plant, being just the reverse of the pea, and is well adapted to the corn belt.

As to soil requirements, it does fairly well on thin clay soils, but still better on good corn land. On extremely rich land it tends to vine too much, and continues to bloom throughout the season, and sets but lit'le seed.

There are a number of varieties of bush beans. The pea bean or navy bean, so famous as a soup maker, is one of the best varieties for the corn belt. It combines hardiness, earliness and yield, and is a stable commodity for which there is always a market demand. The crop should be planted about the second or third week in June, using three pecks of the variety named per acre. The seed is dropped three to four inches apart. A corn planter with bean plates may be used; set at about the same depth as for corn.

The after care can be simplified by going over with the disk harrow two or three times at intervals before planting, as successive crops of weeds appear.

The crop is usually ready to h[illegible] the latter part of August [illegible] of September. The [illegible] after the leaves [illegible] and before the [illegible] ly.

The first step i[illegible] ants off just below the su[illegible] the ground. Some of t[illegible] corn cultivators with a sh[illegible] ting blade answer admirabl[illegible] s are then cured and rak[illegible] the eastern growers pr[illegible] livery rake, though any [illegible] wer. They may be eith[illegible] at once, or mowed. The [illegible] readily, and if stored da[illegible] lor the beans. In fact, a[illegible] ther at harvesting time [illegible] ifficulty with the crop in the [illegible] By adjusting the con- [illegible] grain separator can [illegible] st be done with care, [illegible] from split beans is [illegible] e have repeatedly used [illegible] ashioned ground hog separator [illegible] r this work. For small patches a flail does very well.

After passing through the fanning mill, the beans should be hand picked to throw out any badly discolored or split beans. This is not necessary, but it pays if child labor is available.

From fifteen to twenty bushels per acre is a common yield, and the returns per acre were unusually satisfactory last season. So long as the war continues, high prices will probably prevail, but possibly at a lower level than last year, which was partly due to a crop shortage. A. T. Erwin.

Stretch of Concrete on the Ohio River Road near Parkersburg, W. Va. Built in 1915 under the direction of Burdett Woodyard, Engineer.

The Farmer Can Pull Himself Out of the Mud

FARMERS know the value of permanent roads in their communities. They can get them if they act along the following definite lines:

1. All main highways should be built of concrete to withstand motor car traffic.

2. It is far better to lay out and build at once a system of concrete roads than to build a few scattered miles every year between stretches of mud.

3. It is better to raise a lot of money by a good roads bond issue and build right, than to spend each year the road funds on hand in temporary construction.

4. Concrete is as desirable for roads as for other important structures; and it is the least expensive permanent road material.

Some farmers may not like a bond issue. They do not realize that a very few cents a year per acre is enough to pay off the bonds and all interest.

In Illinois it has been figured out by the State Highway Commissioners that a system of four thousand miles of permanent roads would tax farm land less than three cents per acre per year for twenty years. That's nothing. The whole four thousand miles can be built at once and make a tremendous saving in annual upkeep.

The farmer should act. He can spread information among his neighbors, he can talk to his road officials, influence his lawmakers to pass a good roads bond issue; and he can vote for it.

This Association can give you reliable information about the cost of building concrete roads and how to go about it. Write for Bulletin No. 136.

CONCRETE FOR PERMANENCE

I'll Save You $25 to $50

ON MY NEW IMPROVED SPREADER

My Patriotic Price

I mean exactly that. Get your Spreader from me and save big money. You get your spreader straight from factory to your farm. Deal with Galloway and you deal direct with the maker. This direct-to-you way makes a saving of $25 to $50. I mean every word, and it's absolutely true. My free books explain the whole spreader situation. It's a plain business proposition and will open your eyes when you learn the facts.

My New Low Down Model Has Them All Beat

You would gladly pay $50 more than the price I ask when you see and understand the eleven Galloway Spreader patents and how much they mean to the Spreader. Steel Beater and V Rake tears manure to shreds. The roller feed means light draft. Patented automatic stop, uniform clean-out push-board and unbreakable steel tongue, all remarkable improvements that you want and need on your Spreader. I'll give you the easiest buying plan with any terms to suit your convenience.

Get My Two Free Books Write tonight for them—a postal will do. Read my Spreader story. Summer top-dressing means extra yields and extra profits, and farm products are now higher than ever. Get my low prices before you buy. Send today sure for the books on Spreaders, also Separators, Engines, Tractors and other Implements. Advantageous shipping points save you freight. WM. GALLOWAY, Pres.

Wm. Galloway Co., 39 Galloway Sta., Waterloo, Ia.

Grass and Grains Improving.

Recent Rains Helped Growing Crops—Hay Prospect More Favorable—Still too Cool for Corn—Live Stock Doing Well.

WISCONSIN.

Adams County.—About 10 per cent more rye will be raised this year than last. Oats are a little backward because of cold wet weather. Pastures are good. Cattle are in fairly good shape. Corn is coming up. The acreage of beans will be increased this year. Clover is in good shape. Alfalfa wintered well. There is a shortage of spring pigs.—Louis Wallert.

Barron County.—Weather continues cool and wet, and growth of vegetation has been retarded. Some corn and potatoes are yet to be planted. Pastures are not making the growth they should. —S. J. Shannon.

Bayfield County.—Oats, spring wheat, peas, and barley look fine. These crops have an acreage of about 10 per cent more than last year. Meadows are backward on account of dry, cold weather. The hay crop is improved, however. Most of the corn is planted and potato planting is in full swing. The acreage of potatoes will be about 15 per cent greater than usual. The number of gardens is much larger than formerly. Strawberries are backward; very few are in bloom yet. Live stock are thin because pastures are still scant, but with warmer weather prospects will be very good.—E. C. Stevens.

Burnett County.—Two days of good rains broke the drouth in this section and gave a stimulus to all growing crops. Corn and potatoes were planted in good shape. Some corn is up, and with favorable weather a bumper crop may be expected. Small grain looks well. Pastures are improving, and cattle are looking better. Breaking new ground for fodder corn and rutabagas is in progress. Tame grass looks well.—Fred Larson.

Chippewa County.—Grain crops are in good shape. Because of the cool, dry spring all grains had a good chance to root well and the recent rains have pushed their growth. The hay crop is not so good as last year. Corn is up and looks well. Potatoes are just starting through the ground. Apple trees are in blossom. Garden truck is not very far along yet. Live stock are in good condition. Hogs are selling at from 14 to 16 cents a pound, which is a record-breaking price here. Butter is worth from 40 to 42 cents and eggs from 30 to 32 cents a dozen.—Gustave E. Rhinegans.

Clark County.—Small grain is growing slowly. Corn and potatoes are coming up. The ground is in good condition with just enough moisture, but warmer weather is needed. The present prospect for a big crop of clover and timothy is favorable. Live stock are doing fine on pasture; all stock are healthy. Fruit trees are loaded with blossoms.—Fred Ackerman.

Grant County.—Weather is cool and wet. During the last ten days we have had four or five inches of rainfall. Grass and small grain look fairly well, but it is too cool for corn. Potatoes and gardens are coming along nicely. Much young stock is being raised. Fruit seems to be in good shape.—P. R. Stoffel.

Iron County.—Last month was dry and cold. Meadows and pastures are about 80 per cent normal. Recent rains have helped them considerably. Cattle are in fair shape. The acreage of potatoes was increased about 15 per cent this year. Not all of the crops are in the ground yet. About three-fourths of the garden truck is planted. Apple trees are not yet in bloom.—H. P.

Kewaunee County.—About 75 per cent of the corn is planted; the acreage will be about 10 per cent greater than last year. Cows are on pasture, but the grass is short and backward because of cold weather. Grain is coming up and the stand seems rather thin, but still prospect is favorable. Clover and alfalfa winterkilled badly in exposed places. The potato acreage is about the same as last year. Fruit prospects are promising. Very little hay has been sold here; most of it is fed to live stock. The acreage of wheat is about 20 per cent greater this year than last. Garden truck looks well and strawberries promise about 70 per cent of a crop.—W. C. Katel.

Marinette County.—Excellent rains during the last week have helped pastures. The new seeding and old meadows both look well. Because of the cool weather corn is not growing rapidly. About the usual acreage of potatoes was planted. Farmers are clearing as much land for cultivation as possible. More beans will be planted this year than usual. Prospects are favorable for a heavy hay crop. Cows are worth about $100 a head. Few pigs are on the market.—W. B. Sanderson.

Monroe County.—Rainy weather has delayed corn planting. The early planting is already up. The acreage is normal. Oats and hay are doing fine. Pastures are good and the cows are doing well. Most of the gardens are backward on account of cold weather.—D. E. J.

Oconto County.—Crops in general look well. Planting is all finished. Late potatoes, grain and hay look fine. Pastures are good. The acreage of potatoes will be increased about 10 per cent this year. Cattle are in good condition; milk cows are scarce. Fruit appears to be late. The dry spell was broken by rain on May 30th.—N. J. Henker.

Outagamie County.—Since warmer weather began, all grain and grass crops have made noticeable progress. Pastures are fair. The milk flow is abundant and some cheese factories are pushed to the utmost to take care of the supply. More wheat was sown this year than usual, and the acreage of corn was increased. With a favorable season the production of potatoes will be large. Live stock are healthy; pigs are scarce and high in price. Corn and other feed are scarce. Merchants are paying 32 or 33 cents a dozen for eggs. —Peter Tubbs.

Racine County.—Oats and barley are making good progress. The acreage of these grains is probably 5 per cent greater this year than last. The acreage of corn is about the same as last year, but not all of the acreage is planted yet. Hay land and pastures are in good condition. There will be a large increase in the area planted to cabbage this year.—Chas. Jeffery.

Sauk County.—Weather has been very cold and rainy which has delayed corn planting. Corn which was planted more than two weeks ago is up. Oats and rye are doing well. Meadows and pastures are good, but are short for this time of year. Some potatoes have been planted, but most of the planting is now in progress. Cattle look well and spring pigs are in good shape.—A. H. Buehler.

Taylor County.—Seeding is finished and potato planting is nearly done. Rain is needed to start the new seeding. The hay crop will be late this season unless warmer weather comes soon. Live stock are doing well on grass. Very few cattle are on feed. Hogs are scarce and selling at Chicago prices to local butchers. The lamb crop is reported very good. Wool is worth from 45 to 55 cents a pound. Horses are worth from $150 to $250.—E. H. Dehne.

Trempealeau County.—Small grain, timothy and clover are doing fine. Recent rains have put life into all growing crops. Frost has done some damage to fruit and tender plants. Corn has not been damaged. Live stock find ample feed in pastures. Warmer weather is needed.—C. J. Turner.

Walworth County.—Warmer weather is needed. Heavy rains came on May 31st and June 1st. Corn is about two-thirds planted and some is up. The acreage of this crop will be greater than that of last year. More wheat was sown than usual. Grass and pastures are growing slowly because of cold weather.—Arthur Ewing.

Washburn County.—Recent rains were very beneficial. Small grain is growing well. Rye winterkilled to some extent. Corn is all planted. Potatoes are nearly all planted. Pastures and meadows are short. The pig crop is below normal.—John W. McCulloch.

MINNESOTA.

Dodge County.—All crops are backward. The weather is cold and wet. About 25 per cent more wheat was sown this year than formerly, but the acreage of barley and oats is about as usual. About one-third more corn was planted than the average, but it is slow in coming up. Grass looks well, especially the new seeding. Pastures are good. Fruit trees are full of blossom. Gardens are backward. Young stock are in good shape, but scarce. The pig crop is good.—Frank Houston.

Mower County.—Corn is nearly all planted. The acreage is larger than last year. Very little wheat was sown in this county. The new seeding of clover is good, but the old seeding is light. Fruit promises to be a bumper crop. Apple trees are being sprayed near Austin by the agricultural department. Live stock are healthy and there is a very good crop of young pigs. Fewer cattle are on pasture than usual and they are very high in price. —Walter H. Martin.

"Harness up your motor car to a coffee or spice mill and grind your own flour," was the advice of Mrs. D. W. Redfield, of Evanston, Illinois, at a meeting of the section for housewifely thrift of the Woman's Club unit for patriotic service. "From eight bushels of wheat you now get only five bushels of flour by the old method," said Mrs. Redfield. "Why not grind your own and have it all flour? I have worked a little mill successfully in my own home for years. We had an electric motor connected with the washing machine and we used this same power to grind corn and flour. Any boy could jack up the motor car off the ground, attach the grinding machine to one hind wheel, turn on the power, slip in the clutch and grind the family grain."

The power of gasoline is generally rated by the distance it will propel an automobile. But the same energy, if directed to other and more varied purposes will milk thirty cows, bale four tons of hay, mix thirty-five cubic yards of cement, plow three-fifths of an acre of ground, or it will generate enough electricity to light a large farmhouse for thirty hours.—[Popular Science Monthly.

Your Ford Car

Why it should be lubricated with Gargoyle Mobiloil "E"

In lubricating Ford Cars, there are eight vital considerations. Each one must be met if the engine is to deliver its full power and be free from undue heat and wear.

These factors are:

(1) **Speed, Bore** and **Stroke.** Under the hood you have a small, high-speed engine. The Ford speed conditions demand oil of a different body from that demanded by low-speed conditions. The body of Gargoyle Mobiloil "E" meets this Ford need with scientific exactness.

(2) **Piston Clearance.** The Ford pistons are closely fitted. Each piston has two upper rings and one lower ring and an oil groove. The lower ring tends to prevent a surplus of oil working into the combustion chamber, while the oil groove insures proper lubrication of the wrist-pin. Engineering tests show that the body of Gargoyle Mobiloil "E" forms the correct film for the Ford piston clearance.

(3) **Lubricating System.** The oil is supplied to the forward end of the crank case and flows back to the fly wheel compartment which acts as an oil reservoir, the lower portion of the fly-wheel being submerged below the oil level.

The fly-wheel in revolving, picks up the oil which is thrown by the centrifugal force of the revolving fly-wheel into the catch-basin, from where it is led by ¼" copper piping to the timing gears and then to the oil splash trough under the front cylinder.

From the front splash trough the oil overflows into the second splash trough; from the second splash trough into the third splash trough. From the third splash trough the oil returns to the oil reservoir in the fly-wheel compartment, whence it is again circulated.

Gargoyle Mobiloil "E" has the scientifically correct body to properly distribute to all friction surfaces.

(4) **Cooling.** The Ford engine is water-cooled by the thermo-syphon system, and is equipped with two forward speeds. The continued use of low gear often causes over-heating. For full protection, oil should be used which distributes freely to the heated frictional surfaces, as Gargoyle Mobiloil "E" does.

(5) **Ignition.** The Ford system of ignition is by low-tension magneto, located in the fly-wheel, employing a four-unit coil of the vibrator type. Gargoyle Mobiloil "E" will burn cleanly from ignition points—a most important consideration.

(6) **Bearings.** The Ford bearings are of the two-bolt type, brass with Babbitt lining, closely fitted. The correct body of Gargoyle Mobiloil "E" enables it to properly reach all parts of the closely-fitted bearings.

(7) **Carbon Deposit.** To insure the least carbon under all conditions, an oil should be used whose only deposit will be of a dry, non-adhesive character—easily and naturally expelled through the exhaust. Gargoyle Mobiloil "E", if the proper level is maintained, will deposit little, if any, carbon in a Ford engine.

(8) **Extreme Weather Conditions.** On hot Summer days you will sometimes see Fords running under over-heated conditions, often due to faulty lubrication. Ford owners, who use Gargoyle Mobiloil "E" are free from this trouble, owing to the ability of the oil to absorb and radiate heat. On cold Winter days oil is required of a fluidity which enables it to meet low-temperature conditions and permit ease in cranking the engine. Gargoyle Mobiloil "E" completely fills these requirements.

We guarantee Gargoyle Mobiloil "E" to be fully up to the high standard demanded of all Gargoyle products. It easily reaches all friction surfaces and gives thorough protection after distribution.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloil "E" from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container. If the dealer has not Gargoyle Mobiloil "E", kindly write our nearest branch, giving dealer's name and address.

YOUR TRACTOR

also may be lubricated efficiently with Gargoyle Mobiloils. On request we will mail you a separate Chart specifying the correct grade for each make and model of tractor.

VACUUM OIL COMPANY, Rochester, N.Y., U.S.A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

F. W. Drake, Official Tester.
Leo D. Dunlap, Secretary.
Walworth county, Wis.

In Taylor County.

To the Editor:—Never before have the members of the Medford Cow-Testing Association been so short of feed as at the present time. In spite of this we are still holding our own. In the month ending May 27th, twenty-seven cows in our association produced over forty-five pounds of butter fat. The highest record is 79.8 pounds of butter fat or 99.7 pounds of 80 per cent commercial butter, and that record was made by a grade Holstein cow owned by August J. Brandt. This same cow also carried off the honors in the month of April, both in this association and in the state report, as I get the information from Mr. Negley's reports of the seventy-five associations in the state. Of twenty-seven cows in our association which produced forty-five pounds of butter fat or over in May, four produced more than sixty pounds of butter fat and twelve more than fifty pounds of butter fat. Eight of these high producers are owned by August Brandt, two by Joe Koenig, one by Mrs. Mat Heinz & Sons, four by R. Baehler, two by H. Suter, one by Aug. P. Mueller, one by G. Heubner, one by Albert Zimerli, one by Frank Halopka and two by William Ramm. With the exception of four registered Holsteins, one grade Guernsey and one native, all cows in our association are grade Holsteins. A. T. Zeddis, Official Tester.

In Barron County.

To the Editor:—In the Rice Lake and Cedar Lake Cow-Testing Association 670 cows were tested for the month ending May 1st. Twenty-nine produced more than forty pounds of butter fat. We believe the cost of feed doesn't make so very much difference on a good cow, because we can easily see that it pays to feed the right kind of feed to the right kind of a cow. Our honor cow for April was a grade Guernsey owned by the Cedar Lake Farms. She produced 1,350.2 pounds of milk and 72.91 pounds fat. The forty-five-pound list for the month ending May 1st is as follows:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat

New Association in Waupaca County.

To the Editor:—The Scandinavia Cow-Testing Association, of Waupaca, started its work May 1st with thirty-four members owning 483 cows. I have purchased scales for practically every member and they started weighing milk daily on June 1st. We have already sold two scrub sires and purchased five registered ones. Our members did not feed as heavily as they would have done had not feed been scarce and commercial foods high in price last fall. The rains in May started the pastures and we look for a better report next month. The forty-five-pound list for the month of May follows:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat
Christ Wesley

H. R. Brewster, Official Tester.

In and Around Wisconsin.

A bean and corn contest, open to those who live in the vicinities of Forest, Bloom and Sylvan, in Richland county, and Liberty, in Vernon county, will be an event of much interest this year in that territory. Prizes will be given to the contestant who grows the best acre of beans and the one who grows the best five acres of corn. In each case the first prize will be $15, the second $10 and the third $5. These prizes will be awarded by the Viola Fair Association.

Daily weather reports will be furnished to farmers of Marathon county as soon as the plans of the Wausau Telephone Company are put into effect. The reports will be telephoned to various points throughout the county where they may be obtained by persons in that neighborhood. Weekly forecasts will also be sent out giving the predictions with regard to the weather in the Great Lakes region. In addition notices of approaching storms, frosts, etc., will be made known as soon as they are received from the weather office. This service will be furnished free to farmers.

The Coöperative Cow-Testing Association which was organized not long ago at Mukwonago is doing good work. A. N. Johnston, teacher of agriculture in the Mukwonago High School, was one of the leaders of its organiaztion. The officers of the association are: A. O. Bayley, president; Hugh Thomas, vice president; M. C. Lobdell, secretary, and Willard Poter, treasurer. In addition to the officers the other members of the board of trustees are Frank Kipp, J. Brophy and Fred Andrews.

All expectations have been exceeded by the rapid development of the Ladysmith Coöperative Creamery of Rusk county in production of butter. The product for May, 1917, was 165 tubs as compared with eighty tubs for May, 1916, which is an increase of more than 100 per cent. This increase is especially remarkable when it is considered that pastures have been short this spring and the high cost of feed prevented much supplementary feeding. The prevailing price for butter fat has been about 44 cents, making the payments due farmers for May cream total about $4,000. This record shows that the farmers of Rusk county know how to make a success of coöperative work.

Especially attractive cash prizes are to be offered at the Wisconsin State Fair for Percherons and Clydesdales foaled in 1916. Thes special prizes for yearlings entered in futurity classes have now become a popular and well-established classification at all the leading state fairs in the middle West. The liberal list of prizes enables the small breeder to compete with the large exhibitor and receive creditable cash prizes. The entries were scheduled to close on June 1st, but owing to a delay in making the preliminary announcement, entries will be accepted if mailed on or before June 20, 1917. The entry fee for each animal will be $5. First payment of $1 must accompany the entry; second payment of $1 per entry on or before July 10, 1917, and final payment of $3 per entry on or before August 24, 1917. Substitutions and transfers can be made before second payment is due. The proposed cash prizes are as follows:

Percheron colt foaled 1916

1st	2d	3d	4th	5th	6th	7th	8th	9th
$45	$35	$30	$25	$20	$20	$15	$10	$5

Percheron filly foaled 1916

1st	2d	3d	4th	5th	6th	7th	8th	9th
$45	$35	$30	$25	$20	$20	$15	$10	$5

Clydesdale colt foaled 1916

1st	2d	3d	4th	5th	6th	7th	8th	9th
$35	$25	$20	$15	$10	$10	$5		

Clydesdale filly foaled 1916

1st	2d	3d	4th	5th	6th	7th	8th	9th
$35	$25	$20	$15	$10	$10	$5		

The entries must be made with O. E. Remey, secretary of the state fair, state fair grounds, West Allis, Wis.

Fond du Lac Meeting.

To the Editor:—The Fond du Lac County Holstein-Friesian Association will give their first annual basket picnic June 15th at Unducliff Farm, the home of C. H. Brugger, located on the ledge east of the city. At 10:30 a business session will be held. At 1 p. m. a short program will be given. Professor Gunn, of Madison, is to give an address, after which there will be games and dancing. All breeders of the black and white are cordially invited to come for a good time.

C. H. Brugger, Secy.

National Holstein Meeting.

(Continued from page 1.)

regard mention should be made of the New England hospitality and the carefully planned arrangements made by the people of Worcester to make the few days' stay in their city a pleasant one.

Wisconsin went to the meeting this year with over 1,200 proxies and made a fight for getting the meeting for Milwaukee next year. It was voted to allow the executive committee to appoint the place and they decided not to give a report until fall, which was not entirely satisfactory to the Wisconsin representative, as they felt they were entitled to a decision in their favor at this time. Wisconsin is not necessarily out of the running yet, however. Waterloo had a number of enthusiastic supporters and in all probability the meeting will go to one of the two places mentioned.

The following is a list of Wisconsin breeders who attended: Dr. David Roberts and wife, Waukesha; Fred Pabst, Oconomowoc; Emmons Blaine, Lake Mills; Roy Aitkin, Waukesha; F. Jr. Bristol, Oakfield; Bert Baird, Waukesha; W. G. Baird, Waukesha; D. J. Howell, Waukesha; Garfield Muckleston, Waukesha; F. W. Greene, Evansville; Fred Gusendorf, Chris Schroeder, Racine, and Jas. Garver, Madison.

Twenty Million Miles of Telephone Wire

The telephone wire in use in the Bell System is long enough to run from the earth to the moon and back again forty times.

The Bell System has about twice as much telephone wire as all Europe.

More than 500,000 new telephones are being added to the Bell System yearly—almost as many as the total number of telephones in England.

In twelve months the Bell System adds enough telephones to duplicate the entire telephone systems of France, Italy and Switzerland combined.

In proportion to population the extension of the Bell System in the United States is equal in two years to the total telephone progress of Europe since the telephone was invented—a period of about forty years.

The Bell System fills the telephone needs of the American people with a thoroughness and a spirit of public service which are without parallel the world over.

One Policy One System Universal Service

Good Milk Record.

Ethan C. Peebles, Lake View Stock Farm, Fond du Lac, Wisconsin, sold milk and cream off his farm during the month of April to the total amount of $610.64. This represents the production of a herd of twenty-eight registered Holstein cows. The milk was marketed at Fond du Lac for $2.14 per hundred, the average test being 3.46. Mr. Peebles uses a milking machine and says that this machine enables him to handle his herd successfully despite the shortage in farm help.

With a fund of $25,000, which later may be increased, the Westchester County (New York) Commission of Safety has insured between fifty and seventy-five farmers against all possible loss on their crops in the event that prices should drop, it was announced recently. These farmers, who have enlisted in the reserve army of food producers, are assured a minimum price of $1.50 a bushel for potatoes and $1.75 a bushel for corn and buckwheat. In turn the farmers have pledged themselves to increase their acreage and raise as much food as the soil can develop.

Scraps of left-over meat or fish can be combined with cereal or other mild-flavored food, both to give flavor and to add nourishment to the total dish.

UNCLE SAM WANTS AUTO EXPERTS
YOU CAN QUALIFY IN 6 WEEKS TO DRAW BIG PAY.

The government is paying high salaries to trained auto experts — to men who can drive a pleasure car, truck, ambulance, motorcycle or any other motor-driven vehicle--to men who know how to find and remedy trouble if anything goes wrong.

Milwaukee Motor School
Graduates are in the U. S.
Service at good pay

Preference is always given to trained men—particularly to auto mechanics. Food, munition and supplies will be moved by men who can best drive and care for automobiles; and for such service you can draw better than soldier's pay.

We use no books—you get practical work on all makes of cars, trucks, etc —you do the work yourself under the direction of Mr. Arhelger and other auto experts.

Write us for free book and details telling how you can make big money as an auto expert.

Wm Arhelger Graduates theMilwaukee Motor School has turned out recently have passed Uncle Sam's rigid examination for auto experts.

Liberty Loan

United States Government Bonds for YOU

THAT our allies may buy food and materials to carry on our mutual struggle for democracy, your government is extending them credit through the great $2,000,000,000 Liberty Loan.

Not a dollar of this loan will leave this country or pay for other than American products.

Of the necessity for this loan, Secretary of the Treasury McAdoo says: "The greatest immediate service the American people can render in this war for universal liberty is to furnish the means for its vigorous prosecution. The Liberty Bond Issue is the first step. I earnestly bespeak the co-operation of every citizen throughout the length and breadth of the land in this great service of patriotism."

THE BEST INVESTMENT.

In asking you to subscribe to the "Liberty Loan" your Government does not ask you to spend your money. Instead it holds out to you an opportunity to make the safest investment in the world. When you invest in a "Liberty Bond" you get a signed promise backed by the total resources of the richest nation in the world—a nation whose wealth is recorded at $250,000,000,000.

THE HIGHEST INTEREST IN 20 YEARS.

The present bond issue gives you a chance to purchase government bonds paying the highest interest rate the United States Government has paid in 20 years. Liberty Loan Bonds bear 3½ per cent interest, payable semi-annually June 15th and December 15th. They are exempt from taxation, except for estates and inheritances, and yield an absolutely net income of 3½ per cent.

Liberty Bonds may be purchased in denominations of $50 and multiples thereof. If before the end of the war, government bonds bearing higher interest should be issued, you can exchange your Liberty Bonds for them.

PRACTICALLY AS GOOD AS CASH AND PAYING INTEREST.

The Liberty Loan Bonds are practically as good as cash and they pay interest. They can be used for as many purposes as cash without the risk of actual cash.

They may be registered in denominations of $100 or multiples thereof, so they cannot be lost or stolen. Your income then comes to you automatically.

Liberty Bonds are the best basis for credit in the world. As a farmer you know how handy it will be to use these bonds with your banker to get ready money before your crop is marketed. Machinery and equipment are often cheaper when bought for cash. Let the "Liberty Bonds" help you get it. Your banker will then grow to respect your business judgment and should be willing to make better rates upon the money you borrow.

No investment you hold can be safer and no other bond enjoys such a broad and ready market in case you wish to sell. You can get your money practically as easily as you can from a savings bank.

The last government loan sold at par in 1898 and at 110¾ two years later.

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

Ailing Animals.

Cough in Cow.

I have a yearling heifer that coughs, mostly in the morning. She gets good hay and a little bran. She feels well, or seems to, but looks poor. Would like to know if there is any help for her.

You do not give a very strong line of symptoms, but we would suspect tuberculosis and would advise you to have her tested for same. The condition may not be tuberculosis; however, it might pay you to have a test made.

Cowpox.

Would you please give a remedy for cowpox, and also the cause of it?

Cowpox is a contagious inflammation of the udder and is spread from one cow to the other by the milker, or through other means of contact. In herds of cattle that regularly receive careful handling, no special treatment will be found necessary beyond the application of softening and disinfecting agents to such vesicles upon the teats as may have become ruptured by the hands of the milker. Carbolized vaseline or iodoform ointment will be found well suited to this work. Do not allow the calves to suck the mothers affected. A milk tube, which has been cleansed by boiling, may be used on teats which are badly affected.

Spasms in Young Pigs.

I have some young pigs that had spasms at three days old and I am at a loss to know the cause. There were twelve pigs in the litter. It was cold, so I put them in my furnace room and took them to their mother every two hours. They seemed to be doing fine at first, but on the third day they had spasms and frothed at the mouth. They all died within three hours except five. I gave the mother salts in milk and the five that lived are doing well. One of the men had given her slop from the kitchen which contained raw potato peelings, but outside of this she had only ground rations of corn and barley.

It is very probable these young pigs were victims of acute indigestion, which is quite often seen in young pigs. It was also hard on these pigs to be first in a warm furnace room and then taken out to the mother.

Paralysis in Colt.

I had a colt one year old which was in fairly good shape. Had been running out in cornfield and at a straw pile. I put him in the barn one morning and he seemed to be all right, but at noon he laid down and could not get up. It seemed as though he was hurt in his hind quarters, but he could use his legs and was strong to handle. He ate well and drank water and appeared to be all right except that he could not get up. He was this way for a week. The last four days his head swelled up and just below the butt of the ear and eye it broke open and discharged. It broke also on his right front leg. The discharge had a very bad odor. I killed the colt and I would very much like if you could tell me what was the matter with him.

Probably your colt's first trouble was paralysis, but the second trouble might have come from some trouble such as distemper, or from injury to those parts. It would be hard to make a positive diagnosis of the trouble from the symptoms given.

Sweeny (Shoulder Slip).

I have a five-year-old mare that seems to be lame in the shoulder. Some tell me it is sweeny. She has been lame about two weeks. At first I applied a liniment. Now I notice that the shoulder is shrinking away. She walks fairly well but limps some. When she trots she limps very badly. What can I do for her? I do not have to work her very much. How long will it take to cure her?

This animal should be given complete rest and a severe blister applied over point of shoulder and all over atrophied area, or you might have your veterinarian inject hypodermically tincture of iodine in small amounts in seven or eight places over the sweenied area. This should be followed by daily application of some stimulating liniment for five or six days.

The use of grain in the manufacture of alcoholic beverages was condemned in a resolution adopted by the Kansas Grain Dealers' Association. A copy of the resolution will be forwarded to Washington to be presented to the senate.

Lively Trade in Dairy Cattle

Wisconsin is rapidly becoming the greatest nursery for breeding stock in the United States.

During March and April buyers from other states with commissions to purchase 1,500 head of dairy cattle were met by officials of the Wisconsin Live Stock Breeders' Association.

This represents but a small part of the trade in dairy cattle. For during the same period the college of agriculture received inquiries for over 1,000 head and officials of the community breeders' associations of the state had many calls for stock.

Many of the best live stock exporting counties do not as yet employ agricultural representatives, and are, therefore, not included in this report. But some idea of the growth and development of the industry in those counties can be gained from the fact that one group of Missouri buyers recently purchased sixteen carloads of dairy cattle in the eastern sections of the state.

During April about 200 head of cattle were supplied by the older counties of the southern and central portions of the state to settlers in the newer counties of the North. The settlers of the upper part of Wisconsin furnish an excellent market for live stock and stand for substantial development of this important home industry. Dairying is taking a strong hold in that part of the state just as it has in older sections. Much meat is also being produced there.

Laws Interest Dairymen.

To the Editor:—American or cheddar cheese now containing more than 40 per cent moisture, under Chapter 87, laws of 1917, would be considered an adulterated product and under section 4600 of the statutes a penalty is provided for the sale of an adulterated product. We are enclosing copies of two laws, Chapter 43, relating to whey cream and whey butter. These and Chapter 87, herein above referred to, relating to the moisture of milk and cheddar cheese, were passed during the present session of legislature and are now in effect. Section 1 of Chapter 43 reads as follows:

Whey is the product remaining after the removal of fat and casein from milk in the process of cheesemaking. Whey cream is that portion of whey rich in milk fat which is separated from whey by centrifugal force, is fresh and clean and contains not less than 18 per cent of milk fat. Kumiss is the product made by the alcoholic fermentation of mare's milk or cow's milk.

Section 2 reads as follows:

There is added to the statutes a new section to read: Section 4607d-3. No person shall by himself, his agent or servant sell, offer or expose for sale or have in his possession with intent to sell or exchange or deliver any butter manufactured in whole or in part from whey cream, unless such butter shall have the words "whey butter" conspicuously stamped, labeled or marked in plain Gothic letters at least three-eighths of an inch square, so that the words cannot be easily defaced, upon two sides of each and every tub, firkin, box or package containing said whey butter; or if such butter is exposed for sale uncovered or not in a case or package, a placard containing said words in the form described in this section shall be attached to the mass in such a manner as to be easily seen and read by the purchaser. Any person who violates any of the provisions of this section shall be guilty of a misdemeanor and upon conviction thereof, shall be fined not less than $25 nor more than $100.

Chapter 87 reads as follows:

Section 1. Subdivision (9) of section 4601—4a of the statutes is amended to read: (Section 4601—4a) (9). Cheese is the sound, solid and ripened product made from milk or cream by coagulating the casein thereof with rennet, pepsin, or lactic acid, with or without the addition of ripening ferments and seasoning or added coloring matter and contains, in the water-free substance, not less than 50 per cent of milk fat and cheese known as American or cheddar cheese not more than 40 per cent of moisture; except that Emmenthaler cheese, commonly known as domestic Swiss cheese, shall contain in the water-free substance not less than 43 per cent of milk fat.

Skim milk cheese is the sound, solid and ripened product, made from skim milk by coagulating the casein thereof with rennet, pepsin or lactic acid, with or without the addition of ripening ferments and seasoning.

Goat's milk cheese, ewe's milk cheese, etc., are the sound, ripened products made from the milks of the animals specified by coagulating the casein thereof with rennet, pepsin, or lactic acid, with or without the addition of ripening ferments and seasoning.

George J. Weigle.
Wisconsin Dairy and Food Commissioner.

Variation of Fat in Milk.

To the Editor:—In a recent issue of The Wisconsin Farmer was an article entitled "Effects of Turning on Pasture." Now I have observed many statements from testers (professors of agricultural experiment stations included) and some of them were very misleading. My experience has been that if in the fall when the pasture became scant we turned cows into the clearing (either second or third crop of red clover) the first day and also sometimes the second all cows dropped with the test of milk exactly 1 per cent. The third day and thereafter the test was the same as at other times of the year. A cow that at the average tested 3.8 only the first and sometimes the second day in fresh clover tested 3 per cent or 2.8 per cent.

I have also found some difference in test in winter and also at different times in summer. A cow with a test of 2.8 per cent when a heifer may change to 4 per cent by her fourth calf. Excitement may also change the test. I have one cow, however, that has never changed her test either when fresh or toward the end of lactation; neither cold nor heat, fresh pasture or old affected her test of 3.7 per cent. She is a large Short-horn and always looks fat. I have had natives testing 5 per cent and the Holsteins on an average test 3.6 to 3.8 per cent, and often, toward the end of lactation, 6 per cent. While the fat Short-horn gave 175 pounds of butter fat a year the natives gave 220. Half and half, native and Holstein, give 300 to 320 pounds, but all are young.

I find extra feeding with boughten grain does not pay. As long as my own grain lasts it is not counted at the price of boughten grain, but there is too little to feed. H. R.

Law Questions.

Carrying Concealed Weapons.

A Subscriber, Bagley, Wis.—Can a citizen of Wisconsin obtain a permit to carry a revolver in that state, and, if so how and where?

Answer.—There is no provision in the laws of Wisconsin authorizing permits to carry revolvers or other deadly weapons. The penalty for carrying such weapons is a fine not exceeding $100 or six months' imprisonment.

Release of Mortgage.

A Subscriber, Butternut, Wis.—A holds four notes against B, secured by a mortgage on B's property. All the notes are payable on or before due, and the last note is due in 1920. Can B pay off all the notes at any time before the last one is due and compel A to release the mortgage or must B wait till the last note is due before he can get the mortgage released?

Answer.—By the terms and conditions of the notes B can pay all of them at any time and compel A to release the mortgage. Upon paying the notes B should present to A a release made out and ask A to sign and acknowledge it, and if A refuses to do so he is liable to B for $100 and other damages, which B can recover by law.

Crooked Creek—Flooding Land.

A Subscriber, Eastman, Wis.—My neighbor and I own adjoining farms in Wisconsin, his farm being on higher ground than mine. A creek runs through both farms. There is a bend in the creek on my neighbor's farm, and when there is a flood, the water overflows the banks of the creek at this bend and runs upon forty acres of my corn land, doing it great damage. I have asked my neighbor to straighten out the creek on his land so that the water will flow freely between the banks into the straight channel on my land without flooding it and I offered to help him do so, but he refuses to do anything about it. Can I compel him by law to straighten the creek?

Answer.—You cannot compel your neighbor by law to straighten the creek on his land. You might build a dike or embankment on your land along the division line to prevent overflow water from the creek from flooding your land.

BUY THIS TRIAL LOT ON MY GUARANTEE YOU TAKE NO CHANCES

I'M not taking any chances—neither are you. Cow-Ease does the work. I originated it sixteen years ago, and I *know*. That's why I can afford to personally guarantee your money back if Cow-Ease doesn't do for you just what it has done for thousands of farmers and dairymen.

COW-EASE
Keeps Flies off Cattle and Horses

And keeps every promise I make for it.

It increases the milk yield by keeping cattle contented, and makes milking easier because cows sprayed with it stand quiet.

Cow-Ease is a harmless liquid. It does not gum the hair or blister the skin. Apply it before each milking. One gallon sprays a cow 200 times.

Flies not only irritate your cattle and cause them to produce *less* milk and *poor* milk, but are a menace to your own health.

Ask your dealer for Cow-Ease today—the flies will "shoo" the minute you begin to use it.

M. Elton Rose Vice President.

TRIAL OFFER
If your dealer cannot supply you, send me his name and $1.25, and I will deliver, prepaid to your address a half-gallon can of COW-EASE and SPRAYER for applying. For west of Missouri River and for Canada, above Trial Offer, $1.50.

CARPENTER-MORTON CO. 87 Sudbury St., Boston, Mass.
Manufacturers of Cow-Ease Established 1840

APPLETON Silo Filler

In quantity and quality of silage made per hour

the Appleton has any silo filler beat, by actual *records*. Great capacity, with tremendous strength to stand the hardest, continuous service, made Appleton the choice of those thousands who *investigated* it before they bought *any* silo filler. Have *you* investigated it?

Guaranteed to do more and better work with less power

than any other silo filler. Costs no more to buy and much less to operate. Its all-round economy guarantees you silage at the lowest cost per ton and makes you most profit on work for others. Don't buy until you *know* what Appleton offers. Send for

Two Free Books

about silo building and silage; and about Appleton Silo Fillers, showing 4 sizes for 4 h. p. gasoline engines and up.

Appleton Mfg. Co., 4122 Fargo St. Batavia, Ill.

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood*.

Guaranteed for 20 Years

"But Lasts a Lifetime"

The patented wood "tire" is built up of inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

25 CENTS Calf Rennets

We pay 25c for salted Rennets from milk-fed calves if handled according to directions. The Marschall Dairy Laboratory, Madison, Wis.

The President Says:

"It is of the most imperative importance that everything possible be done and done immediately to make sure of large harvests."

Conserve and Increase Your Forage Crops

Turn under part of your pasture and plant it to saleable crops. Feed your stock cheaper, easier, more profitably with a few acres of corn cut into ensilage with a Kalamazoo Ensilage Cutter and stored in a Kalamazoo silo. Stop wasting land that should be used for money crops. This year, if ever, farmers have a chance to make *big profits*.

Kalamazoo LIFE-TIME-SILOS

are built to meet the exacting farmer's needs. Best in design, material and workmanship. Have every desirable feature a silo should have and embody the "know how" acquired through more than twenty years experience in silo building.

Glazed Tile Silos—fire-proof, frost-proof, storm-proof, decay-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. First cost is the last cost—a written guarantee goes with every one.

Wood Stave Silos—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos are made with Galvanized Steel Door Frames and continuous doors, forming a safe ladder entire height of silo.

Write today for our free descriptive booklet. If interested in an Ensilage Cutter, ask for Kalamazoo Cutter catalog. *Easy Payments*, if you wish.

Work, the Blessing.

Once I thanked God for many a glittering thing
Which now I know was worthless and which passed
With things forgotten and behind me cast,
As I moved onward, borne by time's swift wing.
But never thought I then that work could be
God's gift, but rather, punishment it seemed;
And often in my lonely hours I dreamed
Of days when from its bonds I should be free.

But now I know that work is man's best friend,
Heaven's highest blessing to a world like this;
And now I ask no longer ease and bliss,
But only this: "Give me until the end
Strength for the needed toil as each day passes by.
When I can work no longer let me die."
—Ninette M. Lowater.

The Child--Its Food.

[Amy L. Daniels, Department of Home Economics, University of Wisconsin, tells what to feed children of fifteen months and older.]

What a child is depends largely upon what it eats. Failure to grow normally or to do well in school work can often be traced to one of two causes—an insufficient amount of food or a wrong adjustment of the various necessary food factors. Children grow from small to large individuals. Their rate of growth is determined to a large extent by the kinds and amounts of food they eat.

In feeding a child fifteen months old or over to meet his bodily needs, he should have at least one food each day from the following groups: Group 1, tissue-building foods, such as milk, eggs, fish, meat, etc.; group 2, fruits and vegetables; group 3, wholesome fats, such as butter and the fats found in egg yolks and meats; group 4, bread and cereals; group 5, simple sweets; and group 6, water.

The first group provides protein. Without those foods which contain what scientists call "proteins," and which build up the tissues of the body, a child would not grow. Proteins are present in fairly large proportions in milk, eggs, cheese, fish, meat, peas, beans and lentils. (When peas, beans and lentils are served they should be thoroughly cooked and, for the younger child, mashed or run through a strainer.) Certain other foods contain these essential building materials in very small amounts. The tissue-building materials of milk and eggs are particularly good, and should, therefore, be supplied to the child in fairly liberal amounts. Every child should have at least three cups of milk a day. To this would be added one egg, if the family budget will allow it, and for the older child (three years) a small amount of meat or fish. The child which cannot have the egg should be supplied with more milk. The remainder of the tissue-building needs of the child will be supplied from other foods which are needed in the body for purposes other than building tissues, but which contain small amounts of tissue-building materials in varying quantities.

The second group yields mineral matter. A second need of the child for growth purposes is mineral material. This is especially needed for the development of bones, teeth and muscles. Mineral matter is present in a fairly liberal amount in milk more especially, and in eggs, as well as in fruit and vegetables. Therefore, besides milk, we should include both vegetables and fruit in our children's meals.

A good rule to follow in planning the meals for a child is to serve each day besides the fruit two vegetables—one a starchy food like potatoes or rice or hominy, and a succulent vegetable, such as carrots, spinach, turnips or cabbage. As a considerable amount of valuable mineral matter, one of our chief reasons for serving these vegetables, dissolves out in the water in which they are cooked, the water should be saved. It may be boiled down to a small amount as the vegetables are cooked, and served in this form or made into and served as a sauce, or it may be saved and made into soup.

The fruit given should be in all cases well ripened and may be served either raw or cooked. Underripe and overripe fruit may cause digestive upsets which have led many mothers to believe that fruit is harmful. This is particularly true of bananas, for these are all too frequently served in the unripe stage. When quite ripe, the skins are brown rather than yellow. If bananas or other unripe fruit must be served they should be cooked.

The third group furnishes fats. The heat and energy needs of children should be supplied by those foods that contain fat, starch and sugar. Those fats which are best adapted to children are the fat of milk—butter and cream—and the fat of egg yolk, and, to a certain extent, meat. Vegetable oils, such as olive oil, cottonseed oil, peanut oil and the like, are also good, but should never be allowed to exclude the use of these other fats.

Too much fat may cause indigestion in children. Most mothers are familiar with the digestive disturbances following the excessive eating of rich foods, for example, pastry, rich cakes or fried foods. In these cases, too much fat has been taken together with other materials, which may be detrimental. If we limit fat to the normal amount of butter served on bread, the cream (top of milk) served with cereal, the fat obtained from the milk and egg, and the small amount found in other foods, as, for example, in simple pudding and muffins, the normal child will not be taking too much. Only the unusual child will need greater restriction in the fat content of his diet.

The fourth group supplies starches and sugars. A certain amount of starch and sugar should also be included in the diet of children. These are given for the purpose of supplying energy and heat to the body. The baby gets a sufficient amount of energy foods from milk. The older child must be given a larger proportion, so, besides the milk, he needs cereals, breads, fruits and vegetables, since varying amounts of sugars and starches are obtained from all these.

The cereals given to the child should include those which contain the outer parts of the grain. These not only supply mineral material but a certain amount of roughage necessary for normal digestive processes. The clogging of the intestines (constipation) is most often caused by too highly refined foods. More bulk in the form of coarse cereals, breads made from whole grains, fruits and vegetables, will frequently relieve this condition without using drugs.

The fifth group includes sweets. Because candy supplies nothing but energy material, whereas most of the other foods supply some other essential as well, it is wise to limit the amount of candy or cane sugar that a child takes, lest he get too little of the other materials necessary to build his bones and tissues properly. The lump of sugar or piece of candy at the end of a meal may be beneficial, provided, of course, the child has eaten enough of the other foods served. A small amount of sugar on the cereal may encourage the child to eat what otherwise he would reject, but care should be taken that there is not an undue amount of sugar, or that the child is not eating sugar and leaving cereal.

The modern mother needs to give special consideration to the beverages her children are given. Tea and coffee no longer form any part of a child's diet. They are not foods—only stimulants, and under no condition should they be given to children, even those of high-school age. Chocolate and cocoa may be given in moderate amounts to the older child. In both of these are contained a stimulating material similar to that in tea and coffee, but in lesser amounts. Sometimes very small amounts of cocoa are added to the milk for younger children in order to get them to take more milk. Only under such conditions is this permissible.

A liberal amount of water should, in all cases, be given. This may be taken not only between meals but with meals as well. Care, however, should be exercised that the water is taken between bites and that it is not used to wash the food down. Children must be taught that food must be thoroughly chewed. Soft drinks, except those made from fruits, as lemonade and orangeade, or grape juice and the like, should be prohibited. Many mothers are not aware that root beer may contain a considerable amount of alcohol. This, as well as all other alcoholic beverages, should be forbidden.

All children should be given three meals a day, and the amount given should be fairly evenly distributed among the three meals except for the undernourished child. Between-meal lunches should be discouraged. The habit among high-school children, especially, of going to school without breakfast or with a cup of coffee and a slice of toast, is dangerous. A goodly portion of our girls who fail to complete their high-school courses because of ill health or low grades are undernourished. This does not mean that the home is not supplying enough food, but that the home does not see that the girl gets enough of the right kind of food. Success in all phases of life means adequate nourishment. Food faddists are in danger of being undernourished.

A normal healthy child seldom eats too much, although he may eat too much of one kind of food of which he is particularly fond. Only candy need be cited as an example. Good food habits should be taught early and the children should learn to eat a variety of foods. Nutritional safety lies in a fairly liberal supply of a variety of foods. If a person eats a variety of foods, he or she is much more likely to get some of all the necessary food substances than in cases where the variety is limited.

House Ants.

Ants are attracted to the house by grains of sugar and crumbs of bread or cake on the floor and shelves of kitchen or pantry. Absolute cleanliness and neatness, therefore, is the surest way of preventing a siege of this troublesome pest. This applies, also, to the porches and yards. The practice of sweeping crumbs into the dooryard is accepted as an invitation by the ant.

Once having gained access to the house the ants may be trapped by moistening porous sponges with sweetened water and placing them where the insects are most numerous. The sponges should be inspected several times every day and if ants have collected in them they should be destroyed by plunging in hot water, the sponges again prepared with the sweetened water and replaced.

The most effective means, however, is to find and destroy the nests. There are three or four species of ants which bother indoors, the little red ants and the little black ants being the most common and troublesome. The little red ant is the true house species, making its nest behind the plaster, wainscoting or baseboard and mantels, beneath flooring, and, in fact, wherever there are cavities with external opening. The little black ant is not strictly a house species, although frequently found indoors and becoming at times as troublesome as the red ant. Its colonies are usually located under walks and stones, in the yard and under steps and low platforms.

The red house ant is usually difficult to eradicate, but, if the nest is found, two or three ounces of carbon bisulphide can be injected into it, which will kill the queen and workers present and the rest will then die out in time. The nest of the little black ant is more easily located by following the workers as they leave the house and go into the yard. The nest can be treated with hot water or by injecting carbon bisulphide, which may be applied through one or two holes in the top of the nest. These holes after treatment should be covered over with earth.

Chickens Will Help.

To the Editor:—The women are all asked to do their bit to help out the food supply. Probably there is no better way to do this than to raise poultry. Set eggs whenever possible until cold weather. Meat will be just as high next winter as it is now, and perhaps higher.

One woman I know here says she will keep her incubator full all summer, using turkey eggs when possible and when it is not chicken eggs. Even if not large enough to sell, the chickens will make food at home when they cannot be kept any longer.

Did any of the readers ever salt chicken meat? I have, and, though some of the flavor is lost, the meat is very good, tender and delicate.

N. M. L.

THE YOUNG FOLKS.

How to Make a Kite.

Dear Young Folks:—I have read your letters for several years, but this is the first time I have ever written. I am fourteen years old and went to

school last year. I think I will graduate this year. I have three brothers, but no sisters. I can tat and do lots of crocheting. I take most of the care of the chickens and raised about 500 last year.

I will tell Wallace how to make a

kite. First you take three light sticks about one-fourth of an inch thick, one sixteen inches long and the other two twenty-one inches long. Fasten them together about seven inches from one end, as shown in the drawing. After you fasten them you cut a little slit in the end of each stick and run a string around in these slits. Then lay the frame on some tough paper and cut around the kite about an inch from the string. Put some paste on the edges of the paper and lap it over the string. Then cut three lengths of string a little longer than the sticks and fasten them at each end of the sticks so as to have them crossed in the center, and fasten the kite string where they cross. For the tail use strips of cloth long enough to balance the kite.

I will ask the young folks a riddle. What is it that we often return, but never borrow? —Lucille.

A Bird Lover.

Dear Young Folks:—I will write you about the birds that build around my home. There are bluebirds, martins, wrens, robins, mocking birds, Bob Whites, whippoorwills and lots of others. Lots of them build in our orchard. I like to hear them all sing, but I like the mocking bird's song the best of all. I wouldn't rob a bird of its eggs for anything. I think it is wrong, and, besides, they eat lots of bugs and worms that eat the vegetables in the garden and take up the corn in the field.

I will tell you a story about a litttle boy and his uncle. The little boy's name was Charlie and his uncle's name was Uncle Ben. Charlie had a new rifle, and one morning he said to his Uncle Ben, "Come and go with me to the garden; I am going to shoot some of those mean robins that are eating up all our cherries." Uncle Ben said, "All right," and got his hat.

They were just going through the gate when Charlie said to Uncle Ben, "There's one of them." "Oh, no!" said Uncle Ben, "he was just eating a bug." They stood still a minute and the robin flew back to the cherry tree. This time Charlie thought sure he was eating a cherry and started to shoot him, but Uncle Ben caught his arm and said, "Don't he have to have some pay for his work? He eats the bugs that eat more cherries than the robin does." Charlie decided it wasn't so wrong for the robin to eat cherries after all.

—Mary.

Answers to Ida's Flower Questions.

Dear Young Folks:—I like to read our page and think it a pretty good paper.

I love flowers very much and have planted a good many seeds. A girl named Ida wrote some flower questions and I think I have the answers to most of them.

1. What flower begs to be remembered? Forget-me-not.
2. What flower is the preacher of all flowers? Jack-in-the-pulpit.
3. What flower tells the time of day? Four-o'clock.
4. What flower is worn on the foot? Lady's-slipper.
5. What flower is a color? Pink.
6. What flower is a ferocious animal? Snapdragon.
7. What flower greets the new-born day? Morning-glory.
8. What flower is an amiable gentleman? Sweet William.
9. What flower declines to live on hills? Lily of the valley.
10. What flower is an emblem of great sorrow? Bleeding heart.
11. What flower bears the name of two girls? Rosemary.
12. Which is the youngest of the rose family? Baby rambler.

—Eulalea.

Recipes.

Bran Bread.—One cupful milk, one cupful water, one-half cupful sugar, two teaspoonfuls salt, one-fourth to one yeast cake, one-third cupful warm water, one tablespoonful shortening, one cupful bran, five to six cupfuls white bread flour. Put sugar, shortening and salt in mixing bowl; pour on the scalded milk and boiling water; when lukewarm add the yeast cake softened in the lukewarm water. Add the bran and flour, stirring until thoroughly mixed. Use enough flour to make it the consistency of white bread dough. Put to raise. When double its bulk, knead into loaves; let raise again and bake as white bread.

Spinach Omelet.—One cupful cooked spinach, one and one-half tablespoonfuls flour, two tablespoonfuls butter, one-half cupful cream, one-third teaspoonful salt, few grains pepper, four eggs. Chop spinach fine and make a sauce of the butter, flour, cream, pepper and salt, allowing it to boil thoroughly. Combine this with the spinach, separate the egg yolks from the whites, beat the yolks till lemon-colored, adding a third of a teaspoonful of salt and a little pepper. Beat the whites till stiff and dry and cut and fold them into the first mixture. Pour into a hot, well-buttered omelet pan, put the spinach over the top and cook very gently for about twelve minutes till the egg is set and the omelet brown. Fold as for any omelet.

Whipped Cream Dressing for Fruit Salads.—Three egg yolks, one-fourth cupful sugar, one-fourth teaspoonful salt, one-third cupful vinegar, whipped cream. Beat the egg yolks, add sugar, salt and vinegar and cook in a double boiler until thickened, stirring constantly. Remove from fire and set aside to cool. When cold fold in sufficient whipped cream to make it very fluffy.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Inclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date 1917 spring and summer catalog, containing over 550 designs of ladies', misses', and children's patterns, also some points for the needle. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

Waist 1935-Skirt 1916—A smart tailored dress. Waist pattern 1935 is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 7 yards of 36-inch material for a 36-inch size for the entire dress. Two separate patterns, 10 cents for each pattern.

1383—Shirt for boys and youths. The pattern is cut in 5 sizes: 8 10, 12, 14 and 16 years. It requires 2¾ yards of 36-inch material for a 10-year size.

2107—A pretty summer dress. The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 7⅞ yards of 44-inch material for a 36-inch size.

1425—Ladies' house dress, with long or short sleeve. The pattern is cut in 7 sizes: 32, 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 6¼ yards of 36-inch material for a 36-inch size.

1909—A new coat dress for misses and small women. The pattern is cut in 4 sizes: 14, 16, 18 and 20 years. Size 16 requires 6 yards of 44-inch material.

2119—A becoming popular style for the growing girl. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 2⅛ yards for the guimpe, and 3½ yards for the dress, of 27-inch material.

1937—Junior dress. The pattern is cut in 3 sizes: 12, 14 and 16 years. It requires 3¼ yards for the dress, and 3 yards for the overblouse, for a 14-year size in 27-inch material.

2123—A simple dress for the little girl. The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 3 yards of 36-inch material for a 6 year size.

2127—A simple apron style. Pattern is cut in 4 sizes: Small 20 and 22, medium 24 and 26, large 28 and 30, extra large 32 and 34 inches waist measure. Medium size will require 3½ yards of 36-inch material. Price 10 cents. With the apron you may wear a house dress made after pattern 1435 which is cut in sizes 23 to 44 inches bust measure. Price 10 cents.

1371—Girls' dress in empire style, with or without bodice. The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 2¾ yards of 36-inch material for a 6-year size.

2108—A comfortable play or beach suit for small boys. Pattern is cut in 4 sizes: 2, 3, 4 and 5 years. It requires 2¼ yards of 36-inch material for a 3-year size.

1339—Ladies' kimono perforated for sack length in straight or pointed outline. The pattern is cut in 3 sizes: Small, medium and large, and will require 4½ yards of 44-inch material for the full length style, and 2¾ yards for sack length, for a medium size.

International Sunday School Lesson

(By E. O. SELLERS, Acting Director of Sunday School Course.)

Lesson for June 17, 1917.

The Risen Lord.

LESSON TEXT—John 20:2-16.

GOLDEN TEXT—But now is Christ risen from the dead, and become the first fruits of them that slept.—I. Cor. 15.20.

The death of Christ made a deep impression upon the beholders (Luke 23:48, 49). Joseph, who seems to have been a secret disciple, obtained the body, and gave it burial (Mark 15: 42-47). In Mark's record we have the story of the discovery of the resurrection by the women, and Matthew tells us how his enemies dealt with that fact. Be sure to use a good harmony of the four gospels in presenting all of these lessons, else some important detail will be overlooked.

I. Mary's Visit to the Tomb (vv. 1-10). The Sabbath ended at sundown, and the shops were then open, and Mary Magdalene [illegible] spices with which [illegible] the dead body of Jesus. There is strong probability that the women paid a visit to the tomb late on Saturday (Matt. 28:1, R. V.). Starting the next morning, "while it was yet dark" (v. 1), they came to the tomb to perform this last service of love. Jesus had no need of such [illegible] (Matt. [illegible] 19), but the women were rewarded by receiving the first glimpse of the risen Lord. There were five appearances on this first day of the week: (1) to Mary Magdalene, (2) to the "other women," (3) to Peter; (4) to those on the way to Emmaus and (5) to the ten disciples, Thomas being absent.

None of these seemed to expect Jesus to be risen, for they had each failed to listen to and ponder his words. The extent and genuineness of the affection of the women is found in that they went to serve Jesus when apparently all hope had failed (I. Cor. 13:8, R. V.). as soon as Mary saw the stone rolled away, she concluded that the tomb had been rifled, and hastened to report to the disciples (v. 2). This report of the women to the disciples was considered "as idle tale's" (Luke 24:11). With intense eagerness Peter and John ran to the tomb thus reported as being robbed. John, the younger, reached the tomb first, but in reverence did not enter, only stooping to look in (vv. 4, 5). Peter, the impetuous one, rushes inside, and sees the linen clothes lying, and the napkin that had been about the head carefully folded and lying in a place by itself (v. 7). This apparently insignificant detail is one which is really significant inasmuch as it shows that the tomb had not been rifled, leaving disorder behind. Instead of excitedly snatching the napkin from his face, and hurling it wither it might fall, he had quietly taken it off, and in an orderly way laid it aside. It is in such minute details as this that we see the greatest evidence of the veracity of this record.

II. Mary Weeping (vv. 11-15). The disciples returned to their own homes, and doubtless to the other disciples (v. 10), but the loving Mary remained behind in this place made sacred as having housed the body of the Lord. It is natural for us to linger in silent meditation in places of our greatest revelation or of our deepest soul experience. Jesus had told his disciples over and over again that he should rise again, and it seems strange that his enemies should have remembered it (Matt. 27:63) and his friends not.

III. Mary Worshiping (vv. 16-18). There must have been an inflection in the voice of Jesus, for, upon the utterance of that one word, "Mary," she recognized her risen Lord. Joyfully she exclaimed, "Rabboni," that is to say, "Master" (v. 16), and would have poured out her love and worship at his feet. Jesus, however, does not suffer her to hold him fast. Mary must leave him, and tell the others. Literally, he says, "Do not lay hold of me, but go and make known the glad truth that I am risen again." The risen Lord must return to "My Father" and "My God," whereas the one who would gladly have remained at his feet must go to the brethren, and make known the facts of the fulfillment of prophecy and the resurrection of our Lord.

The bribed soldiers spread abroad the tale that the disciples had stolen his body. The later lives of these disciples, their heroism and martyrdom, are evidence of the absurdity of any such act on their part.

The resurrection of Jesus is a vindication of his claim to being the Son of God. We do well to emphasize his birth, and to dwell much upon his death, yet both of these have no essential value apart from his resurrection.

Apart from this, the cross is the end of a failure. The resurrection demonstrated that Jesus Christ's redemption was not completed upon the cross. The resurrection is better authenticated than any other event in history.

The risen Lord called this weak band of disciples "my brethren" (Matt. 28:10). He is our brother still, and we are to proclaim his work of redemption, the proof of which is the resurrection, unto others who know it not, for this story is no fiction. It is the world's most tremendous and awe-inspiring and glorious fact.

Because rhubarb leaves contain certain substances which make them poisonous to a great many persons, specialists of the United States Department of Agriculture warn housewives against using this portion of the plant for food. A number of letters have been received by the department calling attention to the fact that certain newspapers and magazines are advocating the use of rhubarb leaves for greens, and that disastrous results have followed the acceptance of the advice.

FARMERS' MARKET

Wanted---For Sale---To Exchange

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

The Wisconsin Farmer, Madison, Wis.

FARM LANDS.

NORTH DAKOTA, most successful agricultural state in the Union, producing as many dollars per acre as states where land sells four times as high. In past five years held first place every time in production of wheat and flax; and once in barley. In climate, soil, crops, railroads, schools, roads, North Dakota exactly as good as best in Illinois, Iowa or Minnesota. You can obtain a home there without commission to us, while land is still cheap. Easy terms. Write at once for plan direct dealing. J. S. MURPHY, Immigration Agent, Soo Line Railway, 1272 Soo Bldg., Minneapolis, Minn.

BEAUTIFUL FARM HOME FOR SALE—80 acres, 55 cultivated, balance pasture and grove. Best of soil. Fine house, furnace and waterworks. Basement barn with waterworks. Other necessary buildings. Beautiful location; 15 cattle, 3 horses, nice bunch of hogs and chickens, farm machinery. Crops all in. Price $11,000. We have the best assortment of Wisconsin farms that we have ever had ranging in size from three to 580 acres, many of them fully equipped. Let us send you our new folder, which we know will interest you. It is free. J. T. Bates & Son, Baraboo, Wis.

SILENT PARTNER WANTED—We have a fine chance to buy fine farms close to the city of Oconto, Wis., suitable for stock farms, that would feed over a thousand head of cattle, at a very low price on account of old age and death of owners. There are over 100 head of thoroughbreds on them now that would go with the farm. There is big money for the party that would furnish the money to swing the deal. Address C. S. Hart, Oconto, Wisconsin.

RUSK AND SAWYER COUNTIES—We own 20,000 acres of good land and four townsites on the Soo and Omaha lines. Forties, eighties, etc. $15 to $25 per acre on very easy terms. All high land, plenty of hardwood timber and best clay loam soil. Excellent openings for saw mills and wood-working factories. Write for literature. Upper Wisconsin Land Co., Ladysmith, Wis.

NO PAYMENTS FOR FIVE YEARS—Only taxes and interest; $1.00 per acre down, balance on or before ten years; hardwood timber land with timber enough to pay for the land, close to market, schools and cheese factories; clay loam soil, all tillable. Taylor county, the clover and dairy belt of Wisconsin. Rib River Land Co., Medford, Wis.

$1,000 DOWN—Fine improved 80, only 1½ mile good town, 45 acres splendid field, 15 cleared, balance heavy hardwood. Level, with nice drainage. No rock. Buildings, well, etc. A big snap at $5,000. Come at once. Baker, D.110, St. Croix Falls, Wis.

IS YOUR CASH LIMITED? $300 down takes 29 acres, house 14x26, some cleared, level surface, good soil, no rocks, few stumps and a large piece nearly cleared. Overlooks big lake, handy creamery, school and town. Baker, H-110, St. Croix Falls, Wis.

UPPER WISCONSIN, clover belt, farmers grow rich; 40-80-acre tracts; mile station; good roads, schools, churches; $20-$30 acre, ¼ down, balance easy. R. J. Russell, La Crosse, Wis.

MARATHON COUNTY, WISCONSIN, improved farms $25.00 per acre and up; unimproved farms $15.00 per acre and up. Free list and map. Wm. Albrecht, Jr., Wausau, Wis.

I HAVE 9 IMPROVED FARMS, different sizes, in corn belt. Write Albert Snow, Brown Valley, Minn.

BUSINESS CHANCES.

FREE for six months—My special offer to introduce my magazine, "Investing for Profit." It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer, quickly and honestly. Investing for Profits is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2,200; write now and I'll send it six months free. H. L. Barber, 509-28 W. Jackson Boulevard, Chicago.

MONEY TO LOAN.

MONEY to loan on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

FARM LOANS on very good farms at 5% interest without commission and with privilege of partial payments. Write Geo. L. Jacques, Special Loan Agent, Northwestern Mutual Life Insurance Company, Neillsville, Wisconsin.

HELP WANTED.

WANTED—Young man, good habits, clean milker, to help on small Jersey dairy ranch adjoining town. State wages. Mrs. H. G. King, Salmon, Idaho.

RAILWAY MAIL CLERKS.

RAILWAY MAIL CLERKS WANTED—$75 month. Special examination questions free. Franklin Institute, Dept. D176, Rochester, N. Y.

SAVE MONEY ON LUMBER.

SAVE money on your lumber bill. Write us. Pacific Coast Sawmill Co., Portland, Oregon

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

A Junior Poultryman.

To the Editor:—I am writing you a contribution concerning my flock which consists of 100 Single Comb Brown Leghorns. It is not so very large as yet. I have more in the show line than in the market line. I started to take care of this flock late last spring and in the fall just before the show season opened up a friend of mine, who is somewhat of an expert in the poultry business, came and helped me pick out a few to show. We picked out four females and two males. This friend, Mr. Roberts, showed me different points about the birds and also about fitting them for the show pens. My first show was in December, 1916, at Oconomowoc, and I got first and third on cockerels and first and fifth on pullets and second on best pen, in which class I was beaten by only one-eighth of a point. My total winnings were four ribbons and $4.50 cash. After this show I started fitting my birds for another show late in December at Mukwonago. At this show I received a silver cup and ribbons for best pen of Single Comb Brown Leghorns. After this show the females picked each other's feathers and were damaged so that I could not show them any more that season. Later I bought a cockerel which came from Indiana and put him with my best pen. I also separated these to themselves so I could keep the eggs separately. I have about fifty chicks from this pen and from these I expect to pick several show birds for next season. Fred Southcott, Jr.

Dousman, Wisconsin.

[Editors' Note.—The Wisconsin Farmer is glad to see how well one of our schoolboy friends is getting a start in the poultry business. He writes us that he expected to send us a letter some time last winter, but like all boys who have an ambition to succeed he has been putting in hard licks at school. The Wisconsin Farmer hopes to hear of Fred, Jr.'s, further success in showing his Single Comb Brown Leghorns.]

Poultry and Preparedness.

"An increased attention given to the poultry industry will prove to be one of the country's greatest defenses against a food shortage," says the poultry husbandry department of Iowa State College. "Poultry can be kept profitably on practically every farm and on many town and city lots," they say. It can be more quickly and extensively increased than any other important class of farm animals, and a marked increase in the production of poultry products can be made without an increased use of foodstuffs that can be used more advantageously for direct human consumption or for feeding other farm animals. Poultry is kept in large numbers in China and other countries where the most intensive system of agriculture of the world is practiced and where the demand upon the land for the production of human food is so great that practically all other classes of farm animals are excluded. This is largely due to the ability of poultry to utilize to the greatest advantage waste products of the field and garden such as sprouting seeds, insects and the scattered grain unavoidably left on the harvest field and threshing ground; also a significant amount of the scrap from the table, waste vegetables from the garden and even the clippings and dandelions gathered from the lawn. In addition, by-products of the meat-packing houses, the flour mills, the cereal and starch factories and whey, skim milk and buttermilk in excess of that demanded for human consumption can all be used most profitably [illegible]r poultry feeding. Because poultry [illegible]mong the most efficient of all ani[illegible] in utilizing the food provided for [illegible] the production of the highest [illegible] human food, the grains not [illegible] or human consumption, such as a large part of the corn, oats, barley, kafir corn, millet, etc., can also be fed to poultry most profitably.

The high value of both the materials that can be used for animal feeding and animal products necessitates a greater need than ever before of the use of good stock and a more careful system of management. No longer should the presence of weak and unproductive stock in the flock be tolerated, while special attention should be given to that which is kept that it may have a fair opportunity of serving the country by paying its way. A more general application of practices followed by the most successful poultrymen will tremendously increase the country's supply of poultry products and the profits of those who adopt them.

Those who have their stock hatched early will have a decided advantage in getting the eggs next winter that will doubtless bring the highest price ever realized. Well-matured pullets make the best winter layers. Good care and good feed will do much to overcome the handicap of hatching later.

Poultry parasites will prove to be the poultry keeper's most costly guests. The common chicken mite that too often comes with the season of spring should be informed by a clean and well whitewashed poultry house that he has worn out his welcome. If he appears in spite of this suggestion an application of crude oil or kerosene to the roosts and if necessary a stream of boiling salt water to the nests and other fixtures will urge him beyond resistance.

Lice are the cause of serious loss among the chicks, though not so harmful as mites in the case of mature stock. They can be readily exterminated by applying an amount of a mixture consisting of equal parts of blue ointment and vaseline equal the size of a common field pea to the abdomen and sides of the body beneath each wing of each mature fowl. Extreme care should be taken in handling this material, as it is extremely poisonous. If the hens are properly treated before the chicks are permitted with them it will not be necessary to treat the chicks, thus saving either serious loss or much trouble in treating them.

Scaly leg is a common infectious disease that causes much unnecessary loss. It is caused by the presence of a parasite which works under the scales of the legs and toes and can be readily cured by treating these parts by dipping them in a mixture consisting of equal parts of sweet oil and kerosene.

A tremendous loss represented in the mortality of young chicks can readily be prevented by rigidly following the common homely suggestion of keeping them from getting chilled, overheated or crowded and by feeding a palatable, clean, wholesome and well-balanced ration in limited quantities only for the first few days. Infertile eggs tested from the incubator or under hens, and skim milk and buttermilk are the greatest of all known preventives of bowel trouble and the greatest insurance of a good, healthy growth.

Better care of the eggs produced on Iowa farms sufficient to prevent the present preventable yearly loss would result in an increase in the nation's egg crop greater than the average yearly production in each of half the states of the country. "Swat the rooster;" provide plenty of clean nests; gather the eggs twice each day or oftener during warm weather and once each day at other seasons; keep them in a clean, dry, cool place and market them often without washing is common sense advice which if followed will turn the trick.

The labor problem as it affects the poultry industry can be greatly reduced by greater specialization. High-class breeding stock bred for the purpose for which it is to be used by the poultry specialist will prove to be a greater source of profit than ever to the producer. The central hatchery and the use of the stove brooder greatly increase labor efficiency in poultry production and are certain to increase in importance throughout the country. All in all we seem to see the dawn of the poultry keeper's greatest opportunity.

Feeding Young Guineas.

To the Editor:—I read with pleasure each week your advice on raising different kinds of poultry, and derive much benefit from it, but I have never yet seen anything about the feeding and raising of young guineas. As I am interested in this kind of bird I would like to see an article in your paper as to how to feed them and care for them, as they seem hard to raise.

Mrs. C. R. B.

Lord Devonport, the British food controller, has issued an elaborate order regulating the sale and prices of meat, including live animals. The order prohibits speculative re-sales, eliminates jobbing transactions, and states what profits shall be permitted to dealers and the cost of the carcasses.

Vegetables properly prepared tempt the appetite. When they are soggily cooked or poorly seasoned, much of them will be left on the table.

POULTRY AND PET STOCK.

FOR SALE---S. C. RHODE ISLAND REDS

GOOD BREEDERS from exhibition and trapnested laying stock. Write for prices. **WINNEBAGO POULTRY YARDS, A. J. Schloerb, Mgr., R. 23, Omro, Wis.**

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892; eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

WRITE for low price on best thoroughbred poultry and pigeons, eggs and baby chix, ducks, incubators and brooders. Address Iowa Poultry Farms, Inc., Box 414, Clinton, Iowa.

PURE-BRED White and Barred Rock chicks, 15 cents each. Eggs: $1.00 per 15, $5.00 a hundred. Mrs. J. F. Bloom, Stillwater, Minn.

Fourth of July Packet For You

Count the Dots and Win a Beautiful Prize

You see in the picture, an Automobile covered with dots. Can you count the number of dots on this Auto? If you can find the right number, we will send you as a prize, *a packet of beautiful Fourth of July post cards*, lithographed in rich colors and also a certificate of entry in our grand contest for a Saxon Automobile. All you have to do is to enclose a two cent stamp in your letter to pay postage and cost of mailing.

SAXON AUTO GIVEN AWAY

Remember the Saxon will absolutely be given away at the close of the grand contest. In case of a tie a Saxon will be given to each person so tied. Send at once so you can be entered in this great contest. Full particulars by return mail. **THE AUTO MAN, Dept. 300, Des Moines, Iowa.**

NEWS OF THE SALE RING

R. J. Linscott's Jersey Sale.

The sale of registered Jersy cattle of R. J. Linscott, Holton, Kan., was attended by representative breeders from most all the western states. The auction resulted in the dispersion of 110 head for the average price of $210. The Linscott herd, established 1878, was one of the oldest herds of pure-bred Jerseys west of the Mississippi river and the first register of merit herd in Kansas. Buyers were present at the sale from no less than ten states. The business men's association of Holton, gave a banquet to the breeders, who greatly enjoyed the entertainment. The Kansas Jersey Breeders' Association was organized with 130 members. Col. D. L. Perry, of Ohio, was the auctioneer, assisted by James McCullough and C. M. Crews. Colonel Perry's unique style of conducting an auction was highly appreciated by the audience. The high price for a female was $500, paid by A. H. Wood, of Oklahoma. The herd bull, Jacoba Irene's Premier, sold for $850, the top price, to H. B. Taylor, of Wisconsin. Majesty's Golden Eva brought $460, next to the high price for a female, and was purchased by A. H. Wood. The list of sales included a lot of young calves, which were sold in single lots. The aggregate amount received for the day's sale was $23,980, including a few animals not listed. The bulk of sales are listed herewith:

FEMALES.

Waukesha Guernsey Sale.

One of the most successful sales ever held by Waukesha Guernsey men was their sale on June 7th following the meeting of the Western Guernsey Breeders and the county association at Pewaukee on June 6th. At the conclusion of the sale F. E. Fox was glad to announce that a $357 average had been realized on 47 animals that passed through the ring during the afternoon. Illian's Milk Maid of Maple Hill topped the sale at $1,025. She was bought by W. P. Cowan, of Wheaton, Ill. Nancy of Maple Hill was second, going at $805 to George W. Browne, of Waukesha. Castello's Beauty went to Longhurst Farm at Peoria for $800. Of the 47 animals, 29 sold for $300 and better and no females sold for less than $200. The cattle were well fitted and this together with the breeding helped to make buyers and consignors satisfied with the result.

Warding Off the Currant Worm.

The worst enemy of the currant, so far as it affects the yield of fruit, is the currant worm, which also works on the gooseberry plants. It is well to plant the two fruits close together and the worms will attack the gooseberries first and can be killed there. The worms begin to work in the center of the clumps near the ground and work up, frequently doing much damage before being discovered. For this reason it is well to start early, worms or no worms, by sprinkling the bushes thoroughly when the leaves are half grown, using a teaspoonful of either Paris green or white hellebore in a pail of water. Or the poison may be mixed with a quantity of flour and applied early in the morning when the leaves are wet with dew. Two sprinklings, ten days apart, will surely destroy the first brood of worms. A close watch must be kept for the second brood.

30 Miles Per Gallon Gas

A Real Car Fully Equipped

Saxon Roadster Given Away

People's Popular Monthly Will Give Away This Splendid Saxon Roadster and 14 Other Grand Prizes on September 15th

The $395 Saxon Roadster which will be given away by the People's Popular Monthly on September 15th, is the standard two-passenger car with a four cylinder motor. It is fully equipped with windshield, one man top and storm curtains, carbide lighting system, horn and gasolene gauge, also a full set of tools.

It will carry two people 50 miles an hour, and will run 40 miles on a gallon of gasoline. The Saxon Roadster is being used by salesmen, doctors and others who must cover a lot of ground in a hurry. It certainly does the business. It's a fine looking car, too. This car will positively be given to some contestant; you may just as well be the winner as not. In case of a tie for any prize, the identical prize will be given to each tying contestant.

Here's the Way To Become a Contestant

For this $395 Saxon Roadster. Take your copy of the People's Popular Monthly and show it to your friends. Tell them how much you enjoy it each month. Get three of them to pay you 50c each for a year's subscription to this splendid magazine. Keep 50c for your work and mail $1.00 with the names of the subscribers written plainly on the starting ticket at the bottom of this page. You will then be a full fledged member of the Saxon Auto Club with 3,000 votes to your credit.

Besides the 3,000 votes you will be entitled to 5,000 extra votes for promptness. This will give you a big start of **8,000 votes** in the contest. Just as soon as you send in your three subscriptions we will send you more subscription blanks and helps for getting subscribers. Every subscription counts 1,000 votes and the Saxon Roadster goes to the one having the most votes at the close of the contest. The other 14 grand prizes go to the next fourteen. Moreover, you will be paid a liberal cash commission on every subscription you secure. Get busy today and get the first three subscriptions.

5000 Extra Votes Given for filling out and mailing this Starting Ticket promptly

Starting Ticket in Saxon Roadster Contest

People's Popular Monthly,
Des Moines, Iowa.

Gentlemen: Enclosed find $1.00 for which send People's Popular Monthly to each of the following persons for one year. I have collected 50c from each one and have kept 50c for my work. These subscriptions entitle me to 3,000 votes, besides the 5,000 free votes for sending this list promptly, toward the Saxon Roadster or one of the 14 other grand prizes to be given to members of the Saxon Club at the close of the contest September 15

Gathered by Representatives of The Wisconsin Farmer.

John Jones' Herd.

JOHN JONES, Milton Junction, Wis., has a small herd of registered Holsteins which has been making some exceptionally good junior records, including a 16.56 junior two year old, as well as a 14.72 and 13.78 junior two year old. The tested daughters are sired by Wisconsin Admiral Walker 65689, whose grandsire is Admiral Walker Pietertje, that tied Sir Veeman for second place by having 50 A. R. O. daughters with highest milk and butter production. Mr. Jones recently sold five head under one year at the Lake Mills consignment sale that averaged $254. He now has on hand for sale two bull calves with exceptionally good semiofficial backing. One of these is a calf whose five nearest dams excepting his own average over 932 pounds of butter, while the four nearest dams of the other excepting his own average 1,045 pounds of butter. These calves are good individuals and we would, therefore suggest that breeders looking for a young bull of such breeding and A. R. O. backing would do well to write to Mr. Jones for more detailed information regarding this stock. Please mention The Wisconsin Farmer when you write.—Adv.

J. W. Goldthorpe's Herd.

A FEW days ago we had an opportunity of looking over the herd of Mr. J. W. Goldthorpe, Milton Junction, Wis., and were much pleased with the splendid individuality and excellent A. R. O. records represented. Mr. Goldthorpe has at the head of his herd a 31-pound bull and practically all of his cows have A. R. O. records ranging from 18 pounds at two years to 31 pounds at full age. Mr. Goldthorpe now has on hand a six months old bull calf out of his 31-pound cow for sale. The calf is a splendid individual, well marked and is from as good a pair of individuals as could be desired. The dam in particular is a splendid individual, being a large, strong cow possessing practically all of the desirable points that go to make up ideal dairy conformation, while the calf's sire is a show bull and one that has made a creditable showing at a number of fairs.—Adv.

Chester White Breeders.

ART G. HOSKINS, Dodgeville, Wis., is offering one of his best sows. Since last June she has raised 18 pigs and the best litter on the farm this spring is out of her. Since he is keeping the gilts he will sell the sow. She is right in every way and he is selling her for no fault. He figures that she will be an advertisement for his herd. She is bred to a good boar to farrow August 4th. A good buy for a good breeder. Art will also sell his herd boar, as he cannot use him another year, and, as he is in good condition he will sell him to anyone that appreciates a good boar. He is a grandson of the $800 champion, Schoolmaster, and is a boar with a world of quality. Of course, he will sell spring pigs and he has some dandies. Write this breeder your wants, and mention The Wisconsin Farmer.—Adv.

John P. Vogt, Jr., Chesters.

WE recently called on John P. Vogt, Jr., who has 140 Chester White spring pigs. He has more pigs this spring than he knows what to do with, different from most of the swine men in the state this year. Mr. Vogt has never done much advertising, but this year he feels that he has some good enough to send out and he is going to let the people know what he has for sale. It is only natural that from 140 spring pigs one should be able to pick a few good ones. He has some very fine February and March pigs and these are ready to ship now. His advertisement will appear in The Wisconsin Farmer, starting in July and we will have more to say about this herd at that time. His address is Glen Haven, Wis.—Adv.

Chas. Flesch's Big Mint.

WE still think that Chas. Flesch, Mt. Hope, Wis., has one of the best, if not the best, yearling Poland China boar in the state. We saw this boar again the first of June and he continues to improve with age. He is big and smooth and is all boar. Charlie is not sure whether he will show anything this year or not, though we would like to see him bring this good boar out this fall. He has some pigs that are ready to go and most of them are by his old herd boar, Jumbo's Equal 2d. He has a litter of boars sired by Young's Big Joe out of a Master's Giant Orange Wonder dam. Better speak early if you want one of this litter. His advertisement appears on page 20. Write for prices etc.—Adv.

Patterson, Jr.

[illegible] Patterson, Jr. [illegible]

[illegible] very [illegible] champ- [illegible] have some [illegible] later, but [illegible] late they [illegible] August. Bear [illegible] reference.

[illegible] Wis., has [illegible] spring pigs [illegible] later. Most [illegible] that he bought in the Atwater sale last fall, and by the way this boar is headed for the 1,000-pound class. His pigs have stretch and size and if all goes well Jake will have some good boars to offer in July. Keep this herd in mind.—Adv.

Some Dandy Poland Pigs.

W. F. ACKERMAN, Glen Haven, Wis., who breeds the big-type Poland Chinas, has a bunch of spring pigs that are doing as well or better than any we have seen of like ages. Mr. Ackerman is a good feeder, not only of hogs, but his Herefords and other stock show that they have not been neglected, even though he does have to pay exorbitant prices for feed. The best pigs on the place at this time are by A.'s Big Orange, a Big Orange-bred boar that he used for two years. He has a nice litter by Smooth Price and a good litter by Black Jumbo. His fall boar sired by Master's Giant is doing fine. He was in only ordinary condition June 1st and he weighed right at 300 pounds—he will easily make a 500-pound yearling. Mr. Ackerman will have the best lot of pigs to offer his customers this fall that he has ever had. Keep this herd in mind. We will have more to say about it later.—Adv.

Neeseman Poland Chinas.

WE recently spent some time with Aug. Neeseman, Warren, Ill., breeder of big-type Poland Chinas. Although Mr. Neeseman's postoffice is Warren, Ill., his farm is located in Wisconsin, and he is one of the boosters for Wisconsin Polands. One of the best gilts sold in the Madison sale last winter was from this farm. At this time he has some 125 spring pigs and we will say that we have not seen a bunch of pigs that have as much stretch as those on this farm. At a later date we will have more to say about this herd and we want to say now that this breeder will have a fine bunch of big-type Poland China boars to offer the public.—Adv.

Don't Forget Orion Col. S.

WHEN you get ready to buy that spring boar, don't overlook the pigs sired by Orion Col. S., the big-type Duroc Jersey boar owned by W. C. Jenkins, Bangor, Wis. No breeder has a better bred boar and he is good individually. His sire is the $2,500 Col. S. Jr., and his dam, Opal Orion, is by that great sow sire, Orion Chief. Mr. Jenkins has a nice lot of spring pigs coming on and he is going to have some real herd headers in the bunch. Get his prices before you buy.—Adv.

Do You Want Bargains?

DR. B. L. WERNER, Marshfield, Wis., is offering 20 young, registered Holstein cows that are bargains. They are sired by Zobeda Colantha Sir Lad 70176 and they are bred to Sir Johanna De Kol 19th 64143 whose sire has 66 A. R. O. daughters. These young cows are right in every respect and they are certainly bargains at $250 each, the price Dr. Werner is asking for them. Investigate this offer at once, for they will not be on the market long.—Adv.

Olathe Holsteins.

IF you want Holsteins write Silver Springs Farm Co., Eau Claire, Wis. They have a herd that is noted for its producing ability and if that is the kind you want, communicate with them. Their breeding is standard and they have big, roomy cows that appeal to visitors. They are glad to show their cattle and it is well worth your time to see this working herd. In writing for details please mention this publication.—Adv.

Belgians and Holsteins.

WE call your attention to the advertisement of Post & Wygant that appears on another page of this issue. These men breed and sell Belgian horses and Holstein cattle and just at this time they have some young stuff for sale that they are pricing worth the money. It will be to your interest to investigate this offering. Address Post & Wygant, Barron, Barron county, Wis. See page 20.—Adv.

Roy Horsfall.

ROY HORSFALL, Mt. Hope, Wis., is now nicely settled on his new farm and is better equipped than ever to raise Duroc Jerseys. He has some 30 pigs this spring and as Roy is going to push these pigs, he'll have some good ones to offer later. In due time his advertisement will appear in The Wisconsin Farmer.—Adv.

SALE DATES.

Short-horn Cattle.

Oct. 31, Carpenter & Carpenter, Baraboo, Wis. (Sale at Chicago, Ill.)
Dec. 1, Anoka Farms, Waukesha, Wis.

Growing Sunflowers.

To the Editor:—I notice in a recent issue of this paper an article on sunflowers, and thought I would give my experience in handling them. Few people know they can be threshed with a grain separator. In 1915 I went to Arkansas to run an engine for a relative. After we got through threshing wheat we rigged our machine for threshing peas. We shipped it across the river into Missouri on Saturday to begin the peas on Monday. While we were unloading a man came and wanted to know if we could thresh sunflowers. We told him we could (we didn't know anything about it). Well, we pulled out to the roadside and he brought his crop. The first two or three efforts we failed, then we went to threshing them. The peas did not cure fast and we saved the sunflower crop. We threshed over 9,000 bushels of them and did a fine job. You can put away a crop in a hurry if you can get the help. We ran twenty-three wagons one day and then they could not keep us busy. We used a little Case separator, twenty-eight-inch cylinder, hand feed. The feeder had nothing to do except when a big head would not slip in, then he had a stick to start it to the cylinder.

Subscriber.

It might be profitable this year to consider the plan of sowing a few acres of buckwheat. This is a crop that may be put in as late as the middle of June or even as late as the first of July and yet result in a good yield. It will not do well if seeded early because in that case the hot weather comes at a time when it injures the crop. Buckwheat, to yield well, must blossom and fill in the fall when the weather is cool.

THE MARKETS.

Union Stockyards, Chicago, Ill., June 9th.—Choice beef cattle are gradually working higher, the extreme top this week being $13.75, which is the highest in the history of the trade and the bulk of the long-fed beeves sold at $13.35@13.65; good to choice grades $12.75@13.25; medium to good $12.00@12.75, and ordinary to medium killers all the way from $10.50@12, according to weight, quality and flesh. The "slicker" class have been adversely affected by a heavy movement in the Southwest and were ripe for readjustment. They have had a little feed on grass, and were selling out of line with middle and choice grades. The 800 to 900-pound kinds recently selling at $9.50@10 have been dropped 50c per cwt. and may be expected to work still lower, but the market is technically sound and the prospect does not warrant throwing anything overboard that is doing well and can be carried along. That there will be too many cattle at any time is improbable except that temporary congestion of mild nature may occur from time to time.

June is usually considered a "bearish" month in the hog trade because, as a rule, there is a fairly liberal marketward movement after urgent work in the fields is over, and assuming that such will be the case again this year buyers have thus far succeeded in lowering values slightly. Net declines at the close yesterday were only 15@25c from the closing session of May, but prices averaged 88c lower than the mid-May high spot. The spread in hog values is widening and a month or so hence this feature is likely to become decidedly more pronounced, for by midsummer receipts will include a liberal percentage of "grass widows" and light skippy hogs, and while the near future of the trade looks a little bearish, there will have to be more evidence of a fairly good supply to come during the next 60 days to warrant the prediction of any big, permanent decline in the market.

A continuous downward trend in values has carried sheep and lamb prices anywhere from $2.75@4.75 per cwt. below the high point a half-month ago and while declines were expected by producers as well as market operators, the slump has amounted to more than was looked for. It appears that the market has touched bottom for the present, however, and that some slight reaction may soon occur, as the supply of dry-fed stock has been very closely garnered and there is nothing but light receipts in sight for several weeks, at least, to come.

Fat cattle trade has given a good account of itself again this week. Good to choice grades of both beef and butcher cattle are closing strong to 15c higher than a week ago, handyweight and yearling steers and the top classes of cows and heifers gaining most. Plain and coarse heavy steers have done well to hold their own in the case of low-grade grass she stock, bulls and "slicker" class of killing steers irregular declines have been noted, bologna bulls having been hardest hit and selling 75c@$1 below the high time early last week. The top on yearlings has been steadily crawling up despite scarcity of choice heavy steers, while the big cattle have made little progress. Killers are making a demonstration of their ability to use a lot of light beef at this season, while demand for heavy kosher material is limited. It looks probable that choice

TOO LATE TO CLASSIFY.

HOLSTEIN BULL

WE OFFER A RICHLY BRED HOLSTEIN BULL born April 5, 1917, two-thirds white, straight top line and well grown. Herd on Federal Accredited List of Tuberculin Tested herds. His dam, a granddaughter of King Segis, has a record of 18.25 lbs. of butter at 8 years. We have just made a record of 29.09 lbs. on a sister to this cow. Sire of bull is a grandson of Colantha Johanna Lad. Price for immediate sale, $100. Remember he comes from a clean herd.

GALLOWAY CATTLE.

30 GALLOWAY bulls for sale, 14 to 18 months of age, sired by Standard Favorite and Stanley's Othello. Also cows and heifers and Oxford rams for sale. C. S. Hechtner Chariton, Iowa

yearlings, handy-weights and heavy steers will be on an even basis when temperatures rise, although big cattle are likely to be scarce. That the country has been conserving calves is evident, but many of them are being marketed prematurely. This is a mistake, as they will be worth good money later on. The May run of yearlings was heavy and June to date has duplicated it, as with medium to best corn-fed steer yearlings selling anywhere from $11.50@13.50 there is every incentive to cash. Where cattle are gaining and doing extra well and another 30 to 60 days would put them in the choice class the trade generally believes it will pay to feed to a good finish, but early shipment of common stuff seems advisable, as they are still selling high proportionately and higher than they will sell a month hence, when "grassers" begin moving freely, and by the latter part of June, or early in July a liberal movement of grass cattle from Olkahoma and southern Kansas is expected.

The market for butcher cattle appears to have reached its zenith, in fact medium and low-grade stuff is now selling several points below the recent high spot, particularly grassy grades, and, as the movement of southwestern grass stuff swells further recessions in values are probable. Ripe corn-fed cows and heifers, on the other hand will be scarce all summer and are expected to hold up well. A few prime heavy Kosher cows are selling up to $11.50@12, and fancy heifer yearlings up to $12@12.50, but $8@10 is taking the bulk of the decent to very good fat cows and $8.50@10.65 most of the heifer stuff. Inferior to best canner cows are now selling at $6.25@7 and [illegible] largely at $7.15@7.60. The ab[illegible]ally high bull market of early last [illegible] toppled of its own weight, only a few prime corn feds holding up well. Bulk of the bologna and common [illegible] bulls are 75c@$1 below the recent [illegible] spot, most of the bolognas now [illegible]ing at $8@9. Good to choice veal [illegible]ves are selling largely at $13.75@14.25.

The trade in stock and feeding cattle has been rather quiet again this week. The few good ones are selling as high as any time, but the common and medium grades, which have made up the bulk of the supply the last two weeks, show anywhere from 25@50c per cwt. decline from the recent high spot. Choice flesh feeders are quotable up to $10.50, but are scarce, bulk of the offering of fair to good 600 to 800-pound stockers selling at $8.65@9.60.

The $16 hog has again "taken the count," only a few loads of choice, heavy butcher selling here since early Tuesday above $15.80 and the bulk of the fair to good mediums and mixed butchers going Friday at $15.45@15.50, with rough to good heavy packing at $15.10@15.35, light mixed at $15@15.25 and some common 140 to 150-pound stuff below $15, good to choice pigs largely from $13.25@14.35. The general average price of hogs at Chicago yesterday figured $15.50 against $15.64 a [illegible]go and $16.38 on May 14th last, [illegible] of the year. The spread in [illegible]en common and good hogs [illegible] seasonal manner and [illegible] of the trade that is [illegible] more pronounced a[illegible] eeks.

Pa[illegible] on live mutton values, [illegible] weeks ago, has continued [illegible]al this week and at the [illegible]stand from $2.75@3.25 lowe[illegible]mbs, about $4.50 lower on s[illegible]nd from $3.50@4.75 lower [illegible]uttons than the May high [illegible]ative ewes showing the most loss. Receipts have been light, but demand for the dressed product has been shot to pieces by the high cost of that commodity and killers have shown an ability to get along with a mere handful of mutton in their coolers. The belief is expressed in trade circles, however, that the decline has about run its course. Now that facts are becoming known, it is evident that the 1917 lamb crop is the shortest the country has had in many years. Feeding lambs will be high for the reason that there will not be enough to go around, and everybody will want them. Packers will cut deep, taking half-fat stock that under ordinary conditions would go to the feeder without competition. Wool is high and nothing vended in the sheep house can possibly be cheap. As the trade now stands $13.50@14.25 is taking most of the old crop shorn lambs, $16@16.50 medium to good spring lambs and $9.50 buying best shorn ewes. A load of choice Ohio-fed shorn wethers sold at $11 and $11.50@12.25 bought fair to very good shorn yearlings.

DUROC JERSEY SWINE.

HERE IT IS
NEW DUROC BLOOD FOR WISCONSIN. Sows by CHERRY CHIEF, ROYAL KING, KING ROYAL, LEE'S DEFENDER. Litters: THE ADMIRAL (by Chief's Col.); Valley Chief's Col. (litter mate to above); KING ORION, CHIEF ADVANCER. A limited number of pigs FOR SALE. Order early.

Come and visit our herd and see the sire and dams of these animals.

ADAM LORENZ SHEBOYGAN FALLS, WISCONSIN

Purebred Registered

HOLSTEIN CATTLE

A Holstein owner knows that he holds as an asset something more than size, weight, individuality, breeding and the highest standard of productiveness. He knows that he is a partner, directly and indirectly, in all of the progressive efforts of the Holstein-Friesian Association, and also in its financial soundness and mighty prestige. He benefits from its annual prize offerings of $22,500 and its yearly educational publicity campaign costing $25,000. The official records of its Advanced Registry Office establish for his cows positive and relatively high market values. Since 1908 the average auction price of Holsteins has increased to $255 per head. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklet.

THE WISCONSIN FARMER

VOL. XLVI. NO. 25. THURSDAY, JUNE 21, 1917. WHOLE NO. 1847

THE FIGHT ON HOG CHOLERA

SUCH information as The Wisconsin Farmer has been able to obtain from its readers leads to the conclusion that the pig crop of 1917 is below normal to start with. Some localities report about half the usual number of pigs farrowed, and the loss even among these has been very heavy, owing to the abnormally cool weather during the latter part of April and the fore part of May. This being the situation, it follows that every possible precaution be taken to save the pigs that possess sufficient hardihood to withstand the unfavorable conditions thus far. While there are numerous ailments that swine breeders must be on the outlook for, cholera is the disease to be dreaded more than all others combined. With hogs up to $16 a hundred, a healthy pig ought to command a good deal of respect, and his life is worth fighting for. Those who stay on the farm this year and raise hogs and cattle, and corn and potatoes to supply the world with food will display just as high a form of patriotism as those who shoulder arms.

In many parts of the corn belt cholera has already broken out and the loss up to the present time has been by no means inconsiderable. This means that here and there can be found infected premises and later on, when exchange of work begins in threshing and in filling silos, we may then expect the infection to go like a prairie fire, unless sensible precautions are taken to stamp out the disease promptly and to wipe out all sources of infection. The lead of the United States government in the fight on cholera might well be followed, because the bureau of animal industry has succeeded in working out a plan that will stamp out disease when the matter is undertaken in a systematic and coöperative way. When the disease once makes its appearance it is no time then to quibble over the soundness of this theory or that theory, as there is too much at stake. Individuals here and there may be found who have no confidence in the serum treatment, and very often these men obstruct the whole program. If they will look the facts squarely in the face they will find that there is ample justification for placing confidence in the government's plan of combating cholera. Extensive investigations along this line have been carried on by the Federal Bureau of Animal Industry. The records show that in one county, in 1912, 23.4 per cent of the hogs died from cholera. This work began in 1913, and that year the loss was 10.1 per cent, while the following year it was 5.1 per cent. In 1915 the loss was 1.5 per cent and in 1916, 1.3 per cent.

The work in that county resulted in shedding a great deal of light on the whole hog cholera problem, and, among other things, it was demonstrated beyond doubt that the early use of good serum following an outbreak will save practically all the hogs in a herd. In eighty-three herds, comprised of 4,549 hogs that were treated just as soon as the disease made its appearance, the loss was only .02 per cent. In eighty-eight herds comprised of 4,178 hogs where the disease had made greater progress the loss was 20 per cent, and in thirty-five herds comprised of 2,318 hogs where the disease had advanced still further the average loss ran as high as 40 per cent. In a total of 206 diseased herds containing 11,045 animals there was a loss of 1,893 head, or 17 per cent. Compared with this, statistics were gathered on thirty-three herds containing 2,089 hogs that were not treated and the loss in this case was 1,755, or 84 per cent.

INFECTED PIGS WITH THAT "THOUGHTFUL" EXPRESSION CHARACTERISTIC OF CHOLERA.

The government emphasizes three factors in the control of hog cholera, namely, vaccination, quarantine and sanitation. This does not mean vaccination of every herd, because there is no occasion for injecting serum into hogs in a healthy herd. Let healthy hogs alone, says the department, but give them such inspection daily, so as to be on your guard and detect the first indication that disease has entered the herd. When a hog comes out in the morning, looking as if he were thinking about something, it is time to get busy, because a healthy hog never gives you the impression that he is devoting much thought to anything. Illness changes his whole program, and every man who has had an extensive experience in handling hogs knows what it is to see individuals in the herd come slowly out of the shed in the morning with a very thoughtful expression on their countenances. While it may not be cholera, this condition should be accepted as a danger signal, and the "thoughtful" hog should there and then be placed in a pen by him-

(Concluded on page 9.)

CHOLERA INFECTED YARDS WHICH MUST BE ABSOLUTELY SCRAPED DOWN TO BARE MOTHER EARTH. STONES, LOGS, MANURE AND ALL THINGS THAT ARE MOVABLE MUST BE CLEANED OUT—THOROUGH DISINFECTION MUST THEN FOLLOW.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Spark Plugs Break Often.

Please answer my question in the Farm Mechanics Department. What causes the spark plugs in my Henderson four-cylinder motorcycle to break so often? Is there any remedy for it?

Answer.—The breakage is probably due to the packing nut that holds the porcelain part of the plug being screwed down too tight. This nut should be tightened just enough to prevent the gases from blowing through. If tightened too tight, the porcelain will have no chance to expand when it becomes hot, and it breaks as a result.

Making a Ford Tractor.

I am planning on making a tractor out of my Ford car by bolting an extension on the frame of the car and letting it extend out behind about three feet. To this extension I would attach an axle with drivers thirty-six inches in diameter, the sprocket on the drivers being twenty inches diameter. The automobile wheels would be replaced by three-inch sprockets on the wheel axles. Will this make the tractor run too fast? I want it to travel about 2½ miles per hour. How much horse power will the machine have? If these sprockets drive the machine too fast, please give the diameter of the smaller sprocket to use with the large sprocket, twenty inches diameter. Please also give me the diameter of the large sprocket to use with the three-inch sprocket for a speed of two and one-half miles per hour. Can this tractor be made O. K.?

Answer.—You should have a gear reduction of at least ten to one at the drive wheels. If you use twenty-inch sprockets on the drivers, you would be able to use only two-inch sprockets on the axles. This is too small a sprocket to work well. Using three-inch sprockets on the axles, you should use thirty-inch sprockets on the drivers. You could reasonably expect four to six horse power at the drawbar.

There are devices now on the market for changing a Ford into a tractor. Unless you have most of the parts, plenty of time, a good many tools and some mechanical experience it would be cheaper and more satisfactory to you to purchase one of these outfits.

Clutch Does Not Release.

The clutch that I have on my "Flander Four" motorcycle does not want to work, for some reason. Can a clutch wear so that it will not release? When the engine runs, the clutch will not release, but when I turn the rear wheel by hand, it releases. Can I give the clutch too much oil?

Answer.—Steel disk clutches and cone clutches having no leather or asbestos lining should run in oil for best results. If the oil used is too heavy, some trouble may be experienced from the clutch not releasing properly. Clutches having a leather or asbestos facing usually work better without oil. We cannot say what is the cause of your trouble. There may be a shoulder worn on the clutch shaft. The remedy would be to remove the shaft and file the shoulder tapered, so that the clutch would slip out. The clutch may be adjusted too tight, or some part may be broken.

Replacing Burnt-Out Generator.

I have a Cartercar equipped with a sixteen-volt Jones starter and storage battery. The wiring became short circuited and burnt out part of the wiring and melted some of the connections in the switch. How much more damage was done I do not know. What I want to know is, could I discard the old generator and starter and put on an "Ever-Ready" storage battery charger, using only half of the storage battery? Of course, I would want this equipment for lights only. I do not care much for the starter, and in this way I could take quite a bit of weight off the car. The Ever-Ready starter generates seven volts, five amperes at 2,500 R. P. M. and ten volts, eight amperes at 2,700 R. P. M. against the battery resistance. If this plan is practical, please publish diagram of wiring for two headlights and a tail light. What kind of wire should I use?

Answer.—It would be well for you to have a competent repair man to examine your present generator. Possibly it can be easily repaired. Then if you wish, you could have the outfit for lights only. It is practical to install the Ever-Ready outfit as you suggest if you prefer to do so. You may have quite a little work to do to fit the generator to your machine. Use either three cells of the battery, the three cells being connected in series as at present; or use six cells, connecting the other three cells in series with each other and in parallel with the other series of three cells. This latter combination is to be preferred, and is shown in the figure. Ground one terminal of the generator, unless the generator has only one terminal, in which case one terminal is already grounded inside the generator. Run a wire to the automatic cut-out, and from the cut-out to the battery as shown in the diagram. The method of wiring the lights is shown in the diagram. Use 6-volt, 12-candle-power lights for the headlights and 6-volt, 2-candle-power light for the tail light. Use flexible low tension cable for wiring.

Trouble With No. 1 Cylinder.

I have a new 1917 Model Ford touring car that is giving me much trouble in cylinder No. 1. Every fifteen miles the spark plug in this cylinder has to be cleaned, or it will not fire. Will it help this trouble if I get leak-proof rings? How will it do if I use an oversize piston and ordinary rings?

Answer.—If you have good compression in this cylinder, all that you need is an oversize piston. The piston should not fit the cylinder too tightly; you should be able to put the piston in the cylinder with a piece of newspaper on one side of it. Too small a piston will cause the trouble you mention. If necessary to use new rings, leak-proof rings should give better results than the common ring.

This trouble seems to be due to too much oil at the front end of the motor, the oil supply pipe emptying out at the front end of the crank case. We would be pleased to hear from some of our readers who have had this trouble and overcome it.

Driving Feed Grinder With an Automobile.

I enclose a sketch of a Ford automobile connected to a Duplex No. 30 Kelly crusher and grinder, for making corn chop, chicken feed meal, etc. This ten-horse-power machine grinds twenty to forty-five bushels per hour, and runs at 500 to 900 R. P. M. Please advise me through the Farm Mechanics Department if this will work all right. Is this the right way to rig it up? Will it place any unusual strain on the automobile, or any part of it?

Answer.—The sketch, which space will not permit us to publish, shows a Ford car with one rear wheel jacked up and the car blocked so that the feed grinder may be run by a belt from the rear wheel to the grinder pulley. The great objection to this scheme is that the driving is done through the differential gears, and these gears are not strong enough to stand such service for a very great length of time. A better way would be to mount a jackshaft under the floor of the room where you do the grinding, having two pulleys on this shaft coming up through the floor so as to run the rear wheels of the automobile on them. Run an overhead countershaft from this jackshaft, and drive the grinder from the countershaft. The Ford engine will not be very durable if the grinder is worked continuously at its full capacity. It should stand up well, however, if the grinder is run at about 700 R. P. M.

Learn How GALLOWAY Protects You On Engines!

Get My Patriotic Prices—See What You Save

Stop—don't buy an engine yet. Learn what I save you now on the exact engine you want. Get my Patriotic prices—my way of doing my bit to help the men and women on the farm help the nation in the cry for bigger crops. Get my proposition. It's a winner and will open your eyes to the engine business and how I save you this big money on engines by buying direct the manufacturers. We make our engines complete in our own factories and sell them to you at wholesale.

Easy to Own—Five Buying Plans

My offer—besides patriotic prices—means five easy buying plans—with terms to suit. I also give a power test on your own farm. Listen to this: "I can't give your engine praise enough. I had a 6 h.p. Galloway engine belted to my 16-in. corn mill and it does the work where an 8 h.p. of another make did not. —M. P. Shoemake, Defeated, Tenn." "My 6 h.p. Galloway was 5 years old last fall. Works perfectly, good for 15 years yet.—H. W. Barnes, Delphi, Ind."
